On the 27th the Austro-Hungarian IX. Corps of the I. Army had begun an enveloping advance against the N. wing of the Russian VIII. Army. On the 26th their offensive was in full swing. The XIV. Corps and the IV. Cavalry Div. advanced on Zyduczyn from Kovel, the IX. and X. Corps won the area N. and N.W. of Lokaczyn by fighting, and Szarmay’s N. wing crossed the Bug at Markostaw. By the end of Aug. the main body of the Archduke Josef Ferdinand’s army, which had been set at liberty N. of Brest Litovsk, had been brought over to the N. wing of the I. Army. On the arrival of the army command, the two armies, under the Archduke’s Higher Command, continued the offensive begun by Puhaillo against Luck and Dubno. The advance which followed, with which the II. and Southern Armies were associated in their attack across the Zlota Lipa, led to the Rovno campaign.

BRIAND, ARISTIDE (1859— ), French statesman (see 4:515). Few men in France had gained so much in political knowledge, ability and influence, during the 15 years preceding 1921, as Aristide Briand. The year of the separation of Church and State (1905) marked his entry into the ranks of the coming men in France. His tolerant interpretation of that measure, his desire to bring about a cessation of the bitter strife between old Radicals and the growing body of men who, while remaining Conservative, nevertheless accepted the Republic, marked him out as a man capable of interpreting the signs of the times. At the age of 59 Briand had been seven times prime minister of France. He was first Minister of Public Instruction in the Sarrien Ministry, where he resigned in the succeeding Clemenceau Government until Jan. 1908, when, still under Clemenceau, he became Minister of Justice, a portfolio which he resigned to become prime minister on July 24 1909. After a reshuffle he continued as prime minister from Nov. 3 1910 until Feb. 27 1911. He again took office as Minister of Justice in the Ministry formed by Raymond Poincaré on Jan. 14 1912. He followed Poincaré as prime minister between Jan. 21 1912 and Feb. 18 1913, and retained that office under Poincaré’s presidency until March 18 1914. He was Minister of Justice in the Viviani war cabinet from Aug. 26 1914 until Oct. 20 1915, when he again became prime minister, remaining in office until March 20 1917. He succeeded Georges Leygues as prime minister on Jan. 16 1921. (See FRANCE: History.)

By his eloquence and the suavity of his manner Briand earned for himself many soothing nicknames, such as the “charmer,” the “sire” and the “condorner.” He in his command a voice of pleasing resonance and yet capable of humour, and a wealth of gesture and a knowledge of histrionics acquired from his friend the great actor Antoine. These, with a handsome and dominating personality lightened by a very ready and supple intelligence, explain his countless successes at the tribune.

They were reinforced by statesmanlike qualities of courage and firmness, and a proper appreciation of the right moment at which to strike or to strode retaliatory exceptions of the community. M. Briand struck hard when, in 1910, he mobilized the railwaymen and thus put an end to the most grave labour trouble that had yet threatened France. Leaving far behind him the bitter doctrines of class warfare from which he started, Briand, in speeches at Perigueux St. Chamond, appealed to the country to breathe the atmosphere of appeasement, to accept the clerical struggle as over, and to work unitarily on sane measures of social reform. He was, in these utterances, seeking to create a centre party of moderate Republican sentiment. The constant labour troubles and the dangerous pandering to the greed of labour which had marked previous Radical administrations made his task easy. It was upon this Republican centre that Briand based his majority. His chief work was done during the World War. He succeeded Viviani at a time of considerable difficulty. The first battle of the Marne had been won, but the second was still to come. He had ambitious desires to bring about the culmination of allied war effort which Clemenceau and events alone had the power to achieve. It was under his influence that the first steps towards coordination were taken. He had to fight against the French Parliament’s desire to play a greater part in the conduct of the war than that to which it was entitled. He had also to support in conference against British representatives the claims of the Salonika expedition. As Minister of Foreign Affairs he was largely responsible for the entry of Rumania into the war. In 1921 France gave him her confidence as being exceptionally qualified, by suppleness of character and firmness in argument, to maintain her claims for national security amid the difficulties encountered in enforcing the Peace Treaty. He attended the Disarmament Conference at Washington in Nov. 1921, and stated the case for his country.

(G.A.)

BRIDGE, AUCTION (see 4:531).—As the game of Bridge had succeeded Whist among card-players, so in turn after 1908–10 did the first form of simple or “straight” Bridge give way to Auction Bridge—but the second step was the more complete, for
while Whist is still played, "straight" Bridge practically died at Auction's birth. Even before 1908 it had long been recognized that the great weakness of "simple" Bridge was the restriction of the trump-making power to the dealer and his partner, and their inability to evade that privilege at will—a ruling which enforced the playing of too many poor hands and the forfeiture of too many good ones. Hence arose the plan of putting up every hand to auction, forcing the dealer to open the bidding allowing every player a chance to buy the declaration (naming at each bid the suit which he desired to play), and selling it to the highest bidder (or to his partner in the event of that partner having been the first to name the final suit, in which case the second partner was considered merely the "raiser," not the bidder). Bidding continued until three successive players had passed in lieu of bidding, doubling or re-doubling; any player might abandon his original suit and switch to a new suit, to his partner's suit, or to his adversary's. The bidding having closed, the partner of the buyer became dummy, and the buyer's left-hand adversary became the leader. At first the original suit-values and ranks were retained as at "straight" Bridge, but many vital changes were made. The rubber-bonus was raised to 250. The adversaries of the buyer (hereafter called the Declarant) were debarred from scoring points toward game ("below the line"), taking their profits invariably in the honours-column at 50 a trick regardless of suit. The book for the declarant remained at six; over that he had to take as many tricks as he had bid; if he took more, he could score them all; if he took fewer, he could score nothing except for possible honours—his adversary securing any additional 50 points in the contraction. The book for the adversaries varied with the size of the bid, being always the number of tricks that the declarant dared lose; it was determined by deducting the bid from seven—in a 2-bid the adverse book was 5, in a 3-bid 4, and so on. In a doubled hand, the adversaries scored 100 for each trick over their book, in a re-doubled hand 200. But if a declarant who had been doubled succeeded in keeping his contract, his trick-points were doubled, he received a 50-point bonus in the honours-column, and an additional 50 points for every trick over contract; if he had doubled twice, each of these 50's may be raised to 100, and his trick points went to four times their normal value. Doubling was restricted to one double for each side.

All these points remained in the game as played in 1921, but meanwhile the next move after 1910 was to change the suit-values—competition in the market-place having proved their too great discrepancy, and having shown also that a good spade hand was invariably wasted. The dealer being still forced to bid, his solace for a poor hand was provided by spades at 2 a trick and a stop-loss of 100 honour-points, while good spades were to be bid as "lilies" or "royals" and at 9 a trick. The suits thus ranked: clubs 6, diamonds 7, hearts 8, royals 9, and no-trumps 10—with the merely nominal spade at 2. All went well until certain American players seized the chance to use the low spades as codes, telling their partners the exact make-up of their hands without assuming proper responsibility or risk. It was thus that the first "false" bids appeared. A system of high-spade bids came into vogue in American play ranging from 2 to 7 inclusive, and forming a code ("6 spades," for instance, meant "Partner, take your choice between hearts and no-trumps; I can play either."). The point value being but 12, the partner was enabled to make a comparatively low safe bid. Though this became known temporarily as the "American" game about 1912–3, the sobriquet was really unfair to the majority of American players. These false bids received no support in England and they were entirely anathema to the majority of American players, though accepted by all the contemporary American writers on the game except one. Miss Florence Irwin immediately waged a vigorous war upon them, and the result was that the system was killed. To accomplish this end, however, the game had to be re-made. Spades at 2 vanished, and spades at 9 took the place of royals, the latter term disappearing. The dealer's refuge in the case of a poor hand thus having been removed, the forced opening bid was also abolished. Three successive passes still closed the bidding, except in the case of three opening passes, when the fourth player was still given his chance to bid. An entire hand might be thrown. It was thus that the game continued to be played in 1921.

Certain variants were experimented with during 1913–21, but without disestablishing the recognized game of Auction. "Nullos" were an early variant, their object being to destroy the undue advantage of high cards. The nullo-player had to lose tricks on a poor hand—a much harder thing than to win them on a good one. The idea had long been discussed but had been deemed impossible, as no player could contract to lose all the tricks while carrying an exposed dummy of whose make-up he knew nothing when bidding. Miss Irwin evolved the plan of allowing 6 safe tricks to the bidder of 1 nullo, 5 safe tricks to the bidder of 2 nullos, and so on. She became an ardent champion of this difficult and scientific variant, collecting a large following. Mr. Robertson of England also wrote an extremely deep and clever book on nullos, adding much to the sum of knowledge concerning them. But it was a losing site; the nullo game was far too difficult for most people. Another variant appeared in America under the name of "Pirate Auction," but it never received any official recognition, and died almost before it lived. More support was given in some London and Paris clubs to "Contract Auction" of which the essential point is that no more tricks can be scored toward game than the declarer has contracted to make, a special system of scoring, different from that of ordinary Auction, being adopted; but in 1921 it had still failed to penetrate beyond a limited circle.

In American play, the method of false-bidding was meanwhile revived under the form of "false double." On this system to double any low bid is not meant as a genuine double, but operates as a code. The person who doubles a one-trick bid in any particular suit practically says, "Partner, I have a no-trumper except that I do not stop that suit. Do you?", while the person who doubles one no-trump says, "Partner, I, too, have a no-trumper. Bid 2 in your best suit, for I have general assistance." But here again it would be quite unfair to call this the "American" game, although it is very commonly practised by American players, fine one of the best American authorities have been opposed to it. English players had, up to 1921, declined to adopt any such code.

The American laws have always followed the English laws in substance, with one important exception: in England, the total of a bid must exceed the total of the previous bid, or must equal it and contain more tricks: in America, it is merely necessary to equal it with new tricks, or to out-bid it in number of tricks regardless of total value. Thus in 1921, in England, it was still necessary to bid 5 clubs (=30) to out-bid 3 no-trumps (=30) and 6 diamonds (=45) to out-bid 4 spades (=56); whereas in America, 4 clubs and 5 diamonds would suffice. The American laws have also reduced the revoke-penalty to 50 and abolished "chicane," as having no place in a bidding game; and they make a touched card in dummy a played card. The latest English laws, up to 1921, were drafted in 1914; the latest American in 1920.

Hints to Players.—A minimum first-round opening bid is: 5 trumps with ace or king at the top, worth 7 points (counting every honour two and every plain card one), and an outside ace or guarded king. A first-round bid that is not an opener may (in the case of great trump-length) dispense with the ace in addition and add a "trick." Later-round bids may dispense both with that and with top-trumps; their great requisite is length. No-trumps are bid on three topped suits (an ace and two guarded honours, two aces and one guarded honour, or even four or more guarded honours without an ace). After an adverse suit-bid, the no-trump bidder must be able to stop that suit.

To raise his partner's bid once a player should hold all "trick" and one "raiser"; to raise it twice, one "trick" and two "raisers"; and so on. A "trick" is any one of three things, and a "raiser" is any one of five—those same three and two additional. "Tricks" are: guarded trump-honours, or side-aces, or side-kings, guarded and "raisers" are: guarded trump-honours, or side-aces, or side-kings, guarded and
ours, or side-aces, or guarded side-kings, or singletons, or blank suits. A plain singleton is one raiser, a singleton ace or a blank suit two raisers each. The "trick" and the first "raiser" should lie in different suits.

The bidder makes his bid, and then counts his losers (reckoning all "guards" as losers and the things which they guard as takers). His partner announces as many necessary raisers as his hand warrants. The bidder then deducts his partner's takers from his own losers, and knows how high a bid the combined strength warrants. Count losers to bid and takers to raise or double.

No one should double the only bid he can defeat. No one should double any very low bid, but should double one that affords as many material escapes to his quarry. A doubler should hold the sure book in his hand (trusting his partner for the odd) and should be practically sure that his double affords his enemy no probable means of escape.

The declarant's scheme of play in any declared trump is to exhaust the adverse trumps and then to make his side-tricks; he foregoes this trump-exhaustion only in the case of a cross-ruff between his two hands, or a quick ruff in dummy. The adversaries' scheme in declared trumps is to make quick aces and kings.

The declarant's scheme in no-trumps is to hold up the control of two of his partner's suits, and to establish his own as soon as possible, remembering that "length is strength in no-trump." The adversaries' scheme is to withhold as long as possible the controlling card or cards of the declarant's suits, seeking meanwhile to establish their own best suit.

Quick tricks are the motto in declared trumps, slow tricks and continual "hanging-back" in no-trumps.

**BRIDGE, F.**—BRIDGING, MILITARY.

**BRIDGE, FRANK (1879— ), English musical composer, born at Brighton Feb. 26 1879, was musically educated at the Royal College of Music, which he entered as violin student in 1896, but gained a scholarship for composition three years later. For many years subsequently he was equally in demand both as composer and as viola player, in which latter capacity he was quite first-rate. Often he was called upon to play the viola in quintets with the Joachim Quartet. Bridge was at one time or other a member, as violist, of the Grimson and the Moto quartets. A vast number of songs were produced by him, but it is as a composer of chamber music for strings that his reputation stands. In this category there are four quartets for pianoforte and strings or for strings alone and a sextet; a phantasy trio; a quartet in E minor, which was crowned by an honourable mention at Bologna in 1906. His sonnet, Blow out, you bugsle, has been sung ubiquitously. Among the other works of real importance are his orchestral compositions, *Isabella* (1907); *Dance Rhapsody* (1909): a suite, The Sea (1912); *A Dance Poem* (1914): a suite for stringed orchestra and *A Lament* for the same; a tone-poem, *Summer*. As a conductor Bridge also established his reputation. In 1910-11 he conducted at the Savoy theatre for Marie Brema, and was at Covent Garden with Beecham in 1913.

**BRIDGE, SIR FREDERICK (1843— ).** English organist, composer and conductor, was born at Oldbury, Worcs., Dec. 5 1844. Educated at first at the Cathedral school, Rochester, where his father was a vicar-choral, he became a chorister there in 1850 and 15 years later assistant organist. In 1865 he became organist to Trinity church, Windsor, in 1869 to Manchester cathedral, and in 1875 he was appointed permanent deputy organist to Westminster Abbey. In 1882 Bridge succeeded Turle as organist and master of the choristers at Westminster Abbey, a post he retained until 1918, when he retired with the title of emeritus organist. In 1890 he was appointed Gresham professor of music; in 1896 conductor of the Royal Choral Society; in 1902 King Edward professor of music in London University. He was knighted in 1897, received the M.V.O. in 1902 and was promoted C.V.O. nine years later. Belonging to what has come to be regarded as the "old school," but remaining a popular figure as the organizer of important musical functions, Bridge was a voluminous composer, especially of church music. He has written about a dozen oratorios and cantatas, many successful glees and part-songs; primers on counterpoint, organ accompaniment and musical gestures. Also he published *Samuel Pepys, a Lover of Music* (1903); *A Shakespearean Birthday Book* and an autobiography, *A Westminster Pilgrim* (1910).

**BRIDGES, ROBERT (1843— ), English poet (see 4.532), was in 1913 appointed Poet Laureate. Among his later publications were *Iabat Obscuri* (1916) and an ode on the *Tercentenary Commemoration of Shakespeare* (1910); as well as an essay on *Keats*, several addresses on poetical subjects, and occasional poems during the World War. He also edited *The Spirit of Man* (1916), an anthology in English and French. In the summer of 1920 he originated a letter, subsequently signed by many Oxford tutors, lecturers, professors and some heads of colleges, addressed to the learned world of Germany and intended as an *eirenic*, which was published in the autumn. Its advisory was the occasion of much difference of opinion in academic and other circles.

**BRIDGING, MILITARY** (see under PONTOON, 22.69).—At the beginning of the 20th century all the armies of the civilized Powers were equipped with pontoon trains of various forms. The European continental nations all had steel boat-shaped pontoons varying in size from the large German bipartite pontoon, which had about 8 tons effective buoyancy, to the Italian sprung pontoon specially made for the swift current of the rivers in that country and capable of carrying lorries when two pontoons were placed stern to stern, and the French and Belgian pontoons, which were somewhat smaller than the British. The British army adhered to the bipartite wooden boat-shaped pontoon, 21 ft. over all in length, 5 ft. 3 in. beam, and 2 ft. 5 in. in depth, with a maximum effective buoyancy, when immersed to within 6 in. of the gunwale, of about 4½ tons. The advantages of the wooden pontoon with waterproof canvas skin, as proved by the South African War, were lightness, quietness for night work, and the ease with which bullet holes could be plugged, or holes caused by shell splinters repaired. On the other hand, the steel pontoons undoubtedly stood the rough handling of active service better, and did not suffer like the wooden pontoons when they had to be stored in the open under a hot sun. They can also be more readily manufactured in large quantities in war-time, whilst the difficulty of obtaining a sufficient supply of thoroughly seasoned material greatly hampered the rapid expansion of the British bridging trains. Taking all considerations into account it seems probable that the next pontoons designed for the British army will be of galvanized steel, somewhat larger and appreciably deeper than the present pattern.

---

The British pontoons (as shown in fig. 11) were made in two sections, the bow section having its gunwale rising towards the bow, and the body curved and tapered forward, so as to reduce the force of the current against the bridge. The stern section was rectangular in form, so that two pontoons could be coupled together, stern to stern, or any number of sections could be coupled together to form rafts capable of bearing the weight of the heaviest gun carried in the field. Figure 12 shows the various uses to which the pontoon sections are put in forming light, medium, or heavy bridges. Normally when packed for travelling (as in fig. 11) and when used in the normal form of light bridge designed to take a column of infantry in fours, field guns, and horse transport, the bow and stern sections were coupled together, the pontoon, which could be as much as 160 ft. in length, was launched by sixteen men gripping the handles at each side. The wagons carried also the superstructure of timber road-bearers (or "haulies"), which fit on the saddles of the pontoons to form the bridge, "cheeses" or planks forming the roadway, and "ribars" or wheel-guides which hold the ends of the "cheeses"
secure and form the curb of the roadway. In addition to the pontoon wagons a bridging unit always included wagons carrying adjustable timber trestles known as "Weldon trestles." These were an important part of the equipment, being used to form the piers of the bridge in shallow water near the bank where the pontoons could not float, or to make a landing-stage when the pontoons were used as rafts on a wide river, or without the pontoons to bridge the narrow streams or dry gaps.

![Light Bridge](image1)

![Medium Bridge](image2)

![Heavy Bridge](image3)

![Longitudinal Section](image4)

**Fig. 12.**

In the organization of a British division of 1910–14 were included two, and in the division of 1915 three, "Field Companies Royal Engineers," each of which, besides its other military engineering equipment, included two pontoons and one trestle wagon, the latter carrying two trestles; the three wagons among them carried also five bays of superstructure for light bridge, using five baulks to a bay. This gave every division the means of crossing a river independently, the engineers being able rapidly to form three bridges up to about 75 ft. in length, or one bridge of about 200 ft.; if used to form bridge of half-pontoons capable of carrying infantry in file and pack animals, the equipment could be extended to bridge about double this width.

Bridging trains moving in rear of the army carried each 42 pontoons and 16 trestles with superstructure, as a reserve for the crossing of wide rivers, and these were later supplemented with a superstructure of heavy steel joists, so that the pontoons equipment could be used to form medium and heavy bridges to carry mechanical transport and the heaviest guns and tractors on the road. The pontoon trains were originally drawn by horses, but to save the great number of horses a pontoon train requires, and to give greater mobility, some were adapted for mechanical transport. These consisted of "four-wheel-drive" lorries, each trailing two pontoon or trestle wagons, and were able on good roads to cover much greater distances in less time than the horse-drawn bridging trains.

The "Field Squadrons Royal Engineers" attached to cavalry divisions were equipped with a lighter form of collapsible boat, and each cavalry regiment was provided with an air-raft equipment. A special cavalry bridging train equipped with small steel pontoons was provided for use in Egypt and Palestine. These forms of bridging equipment could take the lighter nature of transport accompanying a cavalry brigade, including horse artillery guns.

On the other hand, the British army when it took the field in 1914 had no reserve of heavy bridge equipment, nor any of the portable steel-girder bridges which were found so invaluable later in the war.

The British army, unlike most European armies, had no specialized bridging units. All the field units of the engineers carried out the annual course of bridging as part of their normal duty. This course was held wherever possible on the banks of a tidal river, and work was mainly concentrated on the pontoon drill which enabled the sappers to handle the material with great celerity. But the training also included practice with various forms of light improvised bridges, and the crossing of rivers by means of barrels, tarpaulin rafts, spar and timber trestles, and other means of construction of light suspension bridges. Little was done in the way of heavy bridging, but all units were taught the use of spars as derricks and sheers for launching girders and moving heavy loads, and a certain amount of pile-driving and heavy trestle work was done. The officers' theoretical course included the design of timber and steel girder bridges of all types, and some gained practical experience in bridging works in India and elsewhere abroad in the course of their employment in peace on the public works. Never, however, before the World War of 1914–18 had the problem to be solved been of such a varied and complex nature. The immense advance in the use of mechanical transport of all kinds, from motor-cars to steam tractors, the greatly increased weight of artillery in the field, and finally the coming of the tank, demanded the use of heavy road bridges not far short of railway bridges in strength.

On the other hand, owing to the ease with which destruction can be carried out by means of modern explosives, advancing troops were more frequently than ever before confronted with the problem of crossing a river or canal when all existing bridges had been destroyed, approaches broken up by explosives, and the river and its environs defended by artillery and machine-gun fire. In such a case pontooning was clearly impracticable, and other means had to be devised by which the infantry could be given a footing on the opposite bank to form a bridge-head to cover regular bridging operations.

For these fighting bridges, which were practically the most important because without them no advance could be made, no standard equipment existed. Each field company improvised its own solution to the problem after reconnoitring the crossing to be forced. Usually the material could only be carted to within a mile or so of the site, and had to be carried by hand the remaining distance across shell-plitted ground, or marshland intersected by dykes. Lightness and extreme portability were thus essentials of the design. Then the material might suffer from shrapnel fire whilst en route or when lying hidden behind a bank or wall, and might be pierced by machine-gun bullets whilst actually
being placed, hence strength and impermeability were required. Lastly, the bridge had to be put together in the dark in perfect silence, exposing as few sappers as possible on the bank, so that simplicity and interchangeability of parts were essential.

For the crossing of minor streams and dykes often met with before or after the main crossing, various devices were used to suit the varying conditions. Plank or light footbridges of the pattern shown in fig. 13 were often sufficient to carry the infantry, but where the span exceeded 10 ft. light trussed bridges of timber, strutted and tied with hoop iron or stout wire, were made up to about 15 ft. in span. Above this limit some form of intermediate support in the form of a float or trestle became necessary. For marshland, muddy ravines, or shell-pitted ground, mats of canvas and wire netting stiffened with wood battens and rolled up for convenience of carriage were found very useful to give a foothold. For horse traffic, corduroy mats of timber bound together with wire and picketed down in place were used, as also were the artillery "trench bridges," 12 ft. in span with timber bearers and 13 in. flooring, made up in sections 5 ft. 6 in. wide to be laid side by side. These were a little heavy for hand carriage; but in most cases they were issued to the artillery before the advance and carried by them in their limbers to be laid down where required.

Next, it becomes necessary to bring forward the field artillery into position on the far bank. For this work the pontoon equipment is invaluable, as it enables a bridge for horse transport to be made across a river more quickly than it is possible by any other means, and the peace training of the British engineers in pontooning work justified itself in the fine work done, notably in the advance across the Aisne in Sept. 1914. The field companies of the New Army were likewise instructed in and equipped for pontooning work, and the material was used to advantage on nearly every waterway on the entire front in France, on the Piave, on the rivers of Palestine, and in Mesopotamia.

Figure 1 (plate) illustrates the type of bridge built with pontoon equipment across a tidal estuary in which the standard service trestle with adjustable transom is used for the bays nearest the shore; that part of the bridge which will ground on the fall of the tide is carried on barrel-piers strong enough to carry the load when grounded, and the floating portion is composed of pontoons. A "cut" is formed in the bridge by disengaging the central floating portion and allowing it to swing on the tide or stream so that vessels may pass freely along

BRIDGING, MILITARY

503

The particular feature of this bridge is the absence of any bolting or riveting of joints. The steel tubes of which the girder is composed have merely to be fitted into the special junction boxes carried on the ends of the transoms and stiffeners, and are held in place by pins secured by split pins. The launching of the bridge is most quickly done by constructing the bridge in skeleton parallel to the river with enough counter-weight on the tail to enable it to be swung on a special trolley or carriage as shown in fig. 9 (plate).

The bridge, when in place, is then lowered from its carriage and decked up; and lastly to make good joints to form an approach as in fig. 10 (plate) in which a tank is shown crossing the bridge. This bridge can carry a tank over a gap of 105 feet. Where a wider river than this has to be crossed, the bridge is carried on special heavy pontoons (fig. 15), or four bays of the bridge may be used on three of these pontoons as a raft, which is then warped across the river. The projecting bay forms the landing stage for the tank (fig. 16).

![Fig. 16.—A 35-ton Tank being ferried across a river on a raft.](image)

The construction of bridges to carry mechanical transport always involves work on approaches, sometimes of considerable length, to carry the traffic on and off the bridge to the main road, and the officer selecting the site has to take carefully into account the time which will be entailed in this construction, as well as the best span or combination of spans to use for the bridge itself. For instance, on a high level site it may sometimes be advantageous to build several smaller spans supported on timber trestles or steel-cube piers to reach the main span so as to save the delay of filling a high embankment approach. Usually the time for constructing a permanent macadam approach road to the bridge would be too great, and the common form of approach to a bridge for heavy traffic was a road of beech slabs cut in the foreside to a thickness of 2 in., about 1 ft. in width and 10 ft. in length. These slabs were best laid for a single roadway in herring-bone fashion, so as to make a road of about 15 ft. in width, the slabs being spiked to longitudinal sleepers and secured by a heavy timber curb along both sides of the road. It is important that the immediate approach to the bridge should be laid out in true alignment and level with the bridge deck, which also should be as even as possible, so that stresses due to impact are reduced to a minimum, and traffic is able to reach the bridge, and move clear of it without special effort.

![Fig. 17.](image)

In mountainous country where pack transport has to be chiefly used, and in theatres of war where still more primitive conditions of transport prevail, the suspension bridge (fig. 17) is the most common form of bridge for all types of service. These bridges have been built in the field to carry lorries, but usually they are only required for pack or even foot traffic. The best materials to use for the suspension type of suspension bridge are chains or steel wire ropes; but telegraph wires are frequently used, and hemp ropes, thongs of hide, or ropes of creaser or grass, have been employed.

Aerial ropeways, too, have been of great value in mountainous countries for the supply of ammunition, stores and water, to have transport up a long steep incline, or as a temporary means of com-
BRIEUX—BRITISH COLUMBIA

munition across a deep gorge or wide river. Many forms of floating bridges have also been constructed from local boats or barges where the pontoon equipment has not been available.

In uncivilized countries the chief problems for the bridge-builder are to devise the best use to which to put the scanty supply of materials available, and to adapt the local resources of the country to advantage, knowing that the transport difficulties render it impossible to obtain all he would desire. But, great as is the task of bridge-building for an army in undeveloped countries, greater still is the work of reconstruction during an advance in a highly developed theatre of war such as France. There the accumulation of means of attack and defence on a grand scale is possible by the use of railroad trains, yet at the same time each of these many lines of communication is sensitive at every river-crossing. Almost without exception these bridges are destroyed by the enemy on his retirement, and an army cannot safely push on its advance without its full equipment of battle means and without clear routes for its supply transport. Hence it is no exaggeration to say that in the final campaign of 1918 in France the power of the British army to advance depended on the speed with which the Royal Engineers could construct bridge-crossings and roads.

During the period Aug.-Nov. 1918 no less than 539 heavy bridges were erected on this front alone, of which 236 were standard steel bridges and 213 of heavy timber or salvaged material, not taking into account the innumerable light improvised crossings and footbridges by which the leading infantry were enabled to attack, and the pontoon and light trestle bridges for field artillery and horse transport.

For such a task executive energy, organization and technical skill are equally, and each in the highest degree, necessary. And to these qualities of the military bridge-builder must be added, for the work in the forward zone, that of personal devotion under fire. It is significant that of the Victoria Crosses awarded to officers and men of the Royal Engineers in the World War more than half were won by acts of conspicuous gallantry in the construction and demolition of bridges.

(E. N. S.)

BRIEUX, EUGÈNE (1858–1911), French dramatist (see 4:503), published four plays after 1910: La Foi (1912); La Feme Scelle (1913); Le Bourgeois aux champs (1914) and Les Américains chez nous (1916). He also wrote some accounts of travel, Voyages aux Indes et à Indo-Chine (1910) and Au Japon par Japo, la Chine, la Corée (1914), as well as a couple of pamphlets addressed to students, one before and one during the World War, during which he devoted himself with variegated arduous and activity to the care of those blinded by wounds.

BRIGGS, CHARLES AUGUSTUS (1841–1913), American theologian (see 4:566), died in New York June 8 1913. His last published works were Church Unity (1909); The Fundamental Faith (1913) and, posthumously, Theological Symbolics (1914).

BRIGHT, JAMES FRANCK (1832–1920), English historian, was born in London May 29 1832. He was the son of Richard Bright, the physician who first diagnosed "Bright's disease" in 1831, and his mother was Eliza Follett, sister of Sir William Follett, who was solicitor-general and attorney-general in Peel's administration (1834–44). He was educated at under Dr. Arnold and at University College, Oxford, where he graduated with first-class honors in 1854. In 1856 he was ordained deacon and joined the staff of Marlborough College, and was the first public schoolmaster to organize a modern side. For this purpose he wrote the necessary school-books himself, including his well-known History of England. After his wife's death in 1871 he left Marlborough and went to Oxford as a modern history tutor and lecturer at University, Balliol and New Colleges and in 1874 was elected to a fellowship at University and in 1878 to an honorary fellowship at Balliol. In 1888 he became master of University College, and threw himself with vigour into university and city life, becoming treasurer of the Radcliffe infirmary, and founder of the first technical school in Oxford, for which he presented a site. His latter years were spent at Ditchingham, Norfolk, where he died Oct. 23 1920. He also published Lives of Maria Theresa and Joseph II. (1897).

BRINKLEY, FRANK (1841–1912), British author, was born in 1841. Having entered the British army, he went to Japan in 1867 in command of a battery of artillery. In 1869 he became principal instructor at the Marine College, Tokyo, under the Japanese Government, and henceforth devoted himself to things Japanese. He left the army, married a Japanese lady, and in 1881 founded the Japan Mail, of which he was proprietor and editor till his death. He was also correspondent for the London Times in Japan. He published Japan (1901); Japan and China (1903), as well as a Japanese-English dictionary, and was the author of the article JAPAN in the earlier volumes of this encyclopedia. He held a unique position among foreign residents in Japan, being an extremely intelligent student of the history and art, and a powerful factor in international politics. He died at Tokyo October 28 1912.

BRISSON, Eugène Henri (1835–1912), French statesman (see 4:574), was again elected president of the Chamber in 1912, and died at his official residence April 14 1912.

BRITISH COLUMBIA (see 4:598).—This Canadian province is traversed from S. to N. by four principal ranges of mountains—the Rocky and Selkirk ranges on the east, and the Coast and Island ranges on the west. The Rocky Mountain range preserves its grandeur and sublimity in the Selkirk Mountain. South of these ranges and the Rockies lies a valley of remarkable length and regularity, extending from the international boundary line along the western base of the Rockies northwards for 700 miles. West of these ranges extend the remains of a vast plateau or tableland with an average elevation of 3,000 ft. above sea-level, which has been so worn away and eroded by watercourses that in many parts it presents the appearance of a succession of mountains. In others it spreads out into wide plains and rolling ground dotted with low hills, which constitute fine areas of farming land. This important region is limited on the west by the Coast Mountain and on the south by the Rocky Mountains, which gradually merges into the Arctic slope.

The area of British Columbia according to the census report of 1911 was 535,416 sq. m. of land, 2,439 sq. m. of water, a total of 535,855 sq. m., and in 1919 was estimated at 535,610 sq. m.

Population.—The pop. of British Columbia increased from 36,247 (less than 10,000 of whom were whites) in 1871 to 392,480 in 1911. The estimated pop. in 1920 was about 650,000. The Chinese pop. was 19,508 in 1911. Japanese immigration took place chiefly after the restriction of Chinese immigration in 1906: in the census of 1911 Japanese numbered 8,587. It is, however, limited by agreement between the Canadian and Japanese governments. After 1906 Hindus, mainly Sikhs, attracted by the high wages paid to other Orientals, came in large numbers and objection to their immigration was removed in 1913 by the Chinese and Japan.

The situation was a delicate one from the fact that these people were British subjects and many of them had served in the British army as soldiers. Their further influx was prevented by diplomatic arrangements. The first census of British Columbia in 1911 was recorded as 2,902. The Indian pop. was returned as 24,744. Of these all but 1,334 were professing Christians. Although about 750,000 acres have been set apart and occupied as Indian reserves, not more than 2% of the land has been cultivated.

The only Indians of British Columbia who devote themselves to agriculture to any extent are several tribes in Yale and Okanagan districts. The Indians are entirely self-supporting; those of the northern interior sell furs to the various trading companies; those on the coast and southern interior are employed in fishing, in the salmon canneries, and in hop-picking. To some extent they are employed in the lumber woods and in various other capacities. Their education is almost exclusively in the hands of several religious denominations, Methodist, Presbyterian, Anglican and Roman Catholic. Those respective spheres of influence are recognized by the Department of Indian Affairs. The Indian population has always been peaceably disposed, largely in consequence of the satisfactory manner in which the Hudson's Bay Co. dealt with them. Many of these early years of occupation, however, the mainland coasts and one or two in the interior were at one time regarded as a dangerous element, but they are now quiet and peaceable. The Indians are divided into many tribes under local names, but they naturally come into large groups. They are made up of the following stocks: Haidan, Tsimsian, Wakashan, Dené (or Athapaskan), Kootenai and Salishan. More than 2,000 belong to nomadic tribes whose affiliations are probably Athapaskan. There is a considerable degree of Indian population on account of the ravages of disease, but it would

* These figures indicate the volume and page number of the previous article.
appear that it is again on the increase. By origins, the chief elements of the pop. of British Columbia in 1911 were: English 133,186; Scotch 66,444; Irish 56,582; Westeners 30,836; Chinese 19,568; Indian 24,744; Japanese 8,878; Hindu 2,292; Scandinavian 15,968.

Vancouver, by far the largest city in the province, had in 1919 a pop. of 84,144. Vancouver, is the capital of British Columbia, and rests on the most southerly point of the peninsula into which Vancouver I. tapers to the Straits of Juan de Fuca. It is the principal and largest city in the province. In more than quarters of others, it is essentially a residential and social centre, to which the fact that it is the capital city adds much. The legislative buildings, which form the most striking feature of the city upon entering the harbour, contain fine collections of art, mineral, agricultural and horticultural specimens. The pop. in 1910 was 39,500. Three m. from Victoria is the fine harbour of Esquimalt, with a naval dockyard. On Saanich mountain, near the southern limit of the city, is a large observation tower, known also as the "Royal City," 12 m. from Vancouver and connected with it by an electric railway, had in 1910 a pop. of 19,000. It is the centre of the rich farming section of the Westminster district, and from its situation on the Fraser river is naturally associated with the salmon-canning industry. It is also largely regarded in the lumber business.

Nanaimo, popularly known as The Black Diamond City, is the principal lumbering centre in British Columbia.
Sturgeon, rock fish and shad are other varieties of fish food. The mackerel is unknown on the Pacific coast. A native oyster, locally known as the "Olympian," is found in considerable quantities at many points of British Columbia and the islets of Vancouver Island and is edible. The eastern oyster has not been propagated, but young oysters are imported from eastern Canada and successfully cultivated. So far it has not been found practicable to propagate the oyster in small quantities or to stock the coastal waters with especially salmon or trout, and there are also whitefish and graylings in the northern waters. The whaling industry was established about 1919 by the Pacific Whaling Co. with headquarters near Nootka and has been successful. The most important sealing industry is now extinct. Only native Indians are permitted to take seals in Pacific waters and as the seals are again increasing in numbers the catches are exceedingly great, and are very numerous at various points along the coast and are rich in oil.

The salmon-canning industry is still considerable, but the Fraser river has been much depleted and steps were being taken in 1920 to restore the fishing. The fishing of the Fraser was growing during the war and increased in respect of many of the smaller fishes by 100 per cent. Great Britain is the largest market for British Columbia salmon. The values of the catches caught in 1919 were: salmon, $173,157,161; halibut, $6,617,481; herring, $1,099,870; pilchards, $371,871; cod, $668,838; flounders, etc., $160,940; black cod, $136,830; sole, $90,484. British Columbia contributed $52,707,107 in own and control fisheries as provincial product to Canada. There were then 74 salmon canneries and one other canning operation in Texas. There were 9 whale and fish oil factories and 20 fish-curing establishments, representing a capital in all fisheries of $640,000. The quantities are given as 22,500 tons are caught on the Fraser river, Skeena river, Rivers Inlet, Naas river, on the coast of Vancouver I., and in a few outlying districts.

The British Columbia originated with the place deposits of the Fraser river and its far-flung industries in the Cariboo district, from which it is estimated that some 535,000,000 or $60,000,000 of gold has been extracted. The undeveloped coal-fields of British Columbia are estimated to extend over 35 sq. miles, and probably in Vancouver I. and Graham I. (Queen Charlotte Is.), and 517 on the mainland. Their resources are stated at 3,110 million tons on the islands and 7,115 million tons on the mainland, of which 65 million tons are anthracite, 567 million tons bituminous and 190 million tons lignite. There are large deposits, as yet undeveloped, of a magnetite and haematite iron. New interest attaches to the coal, iron, copper, and extensive deposits of oil shale extending along the W. coast of Graham Island.

The mineral production in 1919 amounted to $33,296,313, made up of gold, $3,437,145; silver, $3,592,573; lead, $1,425,855; copper, $795,880; zinc, $2,401,420; coal, $161,373; coke, $67,366; miscellaneous products, $2,833,644.

Manufactures.—Lumber in all its forms is manufactured for home consumption and export in over 200 saw-mills. The Canadian Pacific Lumber Company, as well as the larger works at Trail, the cooking of coal, manufacture of pulp and paper, salmon canning, sugar refining, and the manufacture of cement are other industries.

There were in 1918 1,786 factories with $2,447,970,000 capital, giving employment to 59,980 persons, a decrease in wages and salaries. The value of materials used was $503,356,000 and of goods produced $207,678,000.

Shortages of commercial ships during the World War. Owing to the shortage of shipping after its outbreak, a programme of building wooden ships was undertaken under the auspices of the Provincial Government. The Foundation Co. constructed a number of vessels, the Federal Government, the Dominion Government and construction was completed at Victoria and Vancouver.

Transport.—The main line of the Canadian Pacific railway enters British Columbia through the Kicking Horse pass on its way to Vancouver. Another line of the same railway, entering the province by means of the Crow's Nest pass, serves the Kootenay country and joins the main line, by several water connections, at Revelstoke. The Canadian National railways are the same as those of the Canadian Pacific through the northern part of the province to Prince Rupert, near the Alaskan boundary. The Canadian National railways also run through the Yellowhead pass, turning S. to Kamloops, parallel to the Canadian Pacific, on the line of the Fraser river to Vancouver. From Victoria, the Esquimalt and Nanaimo railways run as far N. as Comox, and there is also a Canadian National line on the island. The Pacific Great Northern railway passes through the Cariboo district and makes regular connexions by fine twin-screw steamers with Vancouver and Victoria. The coastwise trade, especially in the summer, is enormous. The Canadian Pacific has also a splendid fleet of mail steamers. The Japanese line from Japan and China, on the outward trip touching at the Philippines, Japan, and China, and returning by the lines of steamers to and from Australia and New Zealand. There are numerous lines of steamships on the Pacific which make Victoria and the interior of the country. The Panama Canal has proved of great advantage to the province. Steamers also ply on the navigable rivers and lakes in the interior of the country.

BRITISH EAST AFRICA.—The East Africa Protectorate; or "British East Africa," was in July 1920 annexed to the British Crown colony and protectorate of Kenya (see KEVNA). BRITISH EMPIRE (see 4,606 *).—The white population of the British Empire in 1921 was (approximately) 60,693,000 (of whom about three-fourths lived in Great Britain and Ireland). Its brown or black population was (approximately) 360,679,000 (of whom British India, the Protectorated Indian States, Ceylon, and the other Eastern colonies and dependencies contributed approximately 323,375,000, West Africa 20,151,000, East Africa 6,315,000, South Africa 5,807,000, British Central Africa 2,607,700, and the West Indies 1,490,000). The population of Tanganyika Territory (German East Africa) is estimated, in the census of 1911, at 5,535,000. The population of German South-West Africa is small, owing mainly to its system of repression in force under German rule; the white inhabitants are between six and seven thousand. Forty-two per cent of the population of the German colonies in Africa were assigned under the Peace of Versailles to Great Britain, against 33% assigned to France and 25% assigned to Belgium. The total area of what was German New Guinea, along with the Bismarck Archipelago and the other islands attached to it, is about 90,000 sq. miles.

A remarkable development took place between 1910 and 1921, both in theory and in practice, in matters relating to the constitutional framework of the British Empire. It is true that at the Imperial Conference of 1911 a proposal, not thoroughly thought out, to set on foot an Imperial Council, of a somewhat nebulous character, received little support; and that, as long as Sir Wilfrid Laurier held the helm in Canada, closer cooperation among the members of the British Commonwealth of Nations was practically out of the question. But this same Conference witnessed a new departure which proved of singular good fortune for British interests. At a secret meeting of the Imperial Defence Committee Sir Edward Grey explained to the dominion prime ministers the objects of the Imperial Conference, and who received a very friendly reception. Mr. Fisher was at the time the Labour Prime Minister of the Commonwealth of Australia, and the feelings of confidence and goodwill aroused by this spontaneous act on the part of the British Government bore abundant fruit when, after a brief interval, he returned to power in the autumn of 1914.

In other ways the proceedings of the 1911 Conference were of importance. Although the proposal of a permanent council or committee, to give continuity to the work of the Imperial Conferences, had come to nothing, mainly owing to the objections raised by Canada, still the establishment of a separate "Dominions Department" of the Colonial Office in London and the issue by it of annual reports were distinct steps in this direction. In any case, in going through the proceedings of the 1911 Conference, one notes a closer grip of existing facts than had been shown at previous conferences. Thus a satisfactory solution was arrived at of the problem of naturalization within the Empire, a solution which was afterwards embodied in imperial legislation. Each dominion must continue to retain the power of regulating its own system of naturalization; but five years' residence in any portion of the Empire qualifies an applicant for the grant of imperial nationality, the decision of the question resting with the Privy Council. Since the portion of the self-governing Empire in which such applicant has resided during the twelve months immediately preceding his application. A discussion of the subject of emigration brought out the great increase which had taken place in the most recent years in the number of British emigrants to the dominions, compared with the number of such emigrants to the United States.
The Conference, further, revealed the weakness of the existing system of political intercommunication. It was shown that the Declaration of London, which involved important questions of maritime law of vital interest to communities separated by thousands of miles of sea from Great Britain, had been approved without any consultation with or even notice given to the dominions. The excuse was that the dominions had not been parties to the Hague Conference; and that the Declaration of London had been the outcome of the proceedings of that body; but the British Government adopted a very apologetic tone and readily endorsed a resolution that, in future, the dominions should be given the opportunity of considering the matter before the signing of any convention which might affect their interests by the British delegates at the Hague Conference; and this same general rule should, as far as possible, hold good in the negotiation of other international agreements.

The anomalous character of the British Empire was well illustrated by the adoption of a resolution which was, indeed, the logical sequel of the action of Lord Salisbury in 1897 in connexion with the grant of a fiscal preference by Canada to British goods; but was none the less of a centrifugal character. It was agreed that in cases in which a British commercial treaty with a foreign Power bound the dominions, negotiations should be opened with the object of securing liberty to any of them to withdraw from the operation of such treaty, without impairing its validity with regard to the rest of the Empire. In some cases foreign Powers were unwilling to agree to such a proceeding; so that the only alternative was the denunciation by Great Britain of a treaty which otherwise it might be in her interest to retain.

Apart, however, from details, the Imperial Conference of 1911 did important work in cementing the intangible links connecting the different parts of the British Commonwealth. In the words of General Botha, it called into life "that friendship which must lead to cooperation, and better cooperation than we have had in the past."

Towards the end of 1911 Sir Wilfrid Laurier's long period of rule in Canada came to a close, the Liberal leader suffering defeat at the general election which took place over the question of trade reciprocity with the United States. In Ontario, whatever may have been the case elsewhere, the contest was fought as one connected with the maintenance of the British connexion; and the triumph of the Conservatives was hailed as a manifestation of imperial loyalty. The new Prime Minister, Sir Robert Borden, had been one of the most ardent supporters of reciprocity, and a more generous contribution by Canada to the needs of the imperial navy was necessary, such contribution must involve a real partnership in the decision of those questions of foreign policy on which might depend the issues of peace or war. For the time being he was satisfied with the undertaking of the British Government that a Canadian representative would always be welcome at meetings of the Imperial Defence Committee, but it was obvious that this could not be the final solution of the problem. Sir Robert's attempt to give substantial help to the British navy by the gift of three battleships failed, it is true, through the action of the Canadian Senate in rejecting the measure; but the political claims which went along with the proposed gift were soon to find a partial fulfilment, the tremendous efforts put forth by the dominions in the World War forbidding, in any case, a simple return to the practice of the past.

On the purely naval and military side of the question, indeed, the results of the war might seem to vindicate the past policy. Dominion statesmen pointed with pride to the action of the little Australian navy, which, at the outbreak of war, promptly gave its services to the capture of the German colonies in the Pacific, whilst it was forthwith placed under the British Admi-

ralty. The question of separate navies was for a long time a bone of contention between British naval experts and dominion public men, but it seems now impossible to contest the principle, though as late as 1918 the British Admiralty continued to advocate a single navy, under a single naval authority. In military matters the development of an imperial general staff and improvement in military education had gone on, under the scheme initiated by Lord Haldane in 1909. Congenial ground was afforded for military reforms by the system of compulsory military training prevailing in Australia and New Zealand, a system which in the former country had been introduced by the Labour party. One may admit that the successes of the dominion troops in the war were mainly due to the individual initiative and valour of the rank-and-file and yet recognize the merits of the machinery through which these worked.

The independent character of the various portions of the Empire was well illustrated by the different attitudes they took up towards conscription, the Parliaments of New Zealand and of Canada, in spite of the hostility of the province of Quebec, having adopted; whilst the people of Australia at two referenda refused its endorsement.

From the political standpoint, however, the situation was less satisfactory. The British Empire had gone to war in 1914 without the dominions having any voice in the decision. The circumstances, indeed, with regard to the violation of Belgian neutrality were so manifest as, in this particular case, to prevent the possibility of discussion; but, in the event of trouble in the future, the casus belli for the whole Empire may not always be so clear. It was obvious, then, that there was a real weakness in the system regulating a practical and efficient defence.

No Imperial Conference was held in 1915, owing to the exigencies of the war; and when it met in 1917, and again in 1918, it was accompanied by a new organ of government, of extreme significance. The Imperial War Cabinet was not, indeed, a Cabinet in the strict sense of the word; because it had no direct executive authority, and because a majority at its sittings could not bind a dissentient minority; but, for practical purposes, it fulfilled the functions of a Cabinet, in concentrating upon a single objective the whole moral and material strength of the scattered Empire. It was hoped that an instrument which had proved so useful for the purposes of war might give the solution to the problem of the Empire in times of peace; such being the expectation of Mr. Lloyd George and of Sir Robert Borden. But a Cabinet of this kind requires a sacrifice of separate interests to the collective good such as is not often found except in times of emergency. Accordingly the meeting of Prime Ministers held in 1921, whatever may have been Lord Milner's intention when summoning it, bore at least in its initial stages little resemblance in its proceedings to a constitutional Cabinet, though in its final report it gave expression to the unanimous views of the Governments of the Empire.

At the opening meeting Mr. Lloyd George declared that, while in the past Downing Street controlled the Empire, to-day the Empire took charge of Downing Street. The main subject of discussion was the question of the renewal of the Anglo-Japanese Alliance. It was agreed by all parties that the alliance would require changes in its form, because of the changed conditions of the world, and in order that it should comply with the obligations imposed by membership in the League of Nations. But on the general question of the renewal of the treaty there was a difference of opinion. The Canadian Prime Minister, adopting the point of view of American public men and intent upon the promotion of the closest friendly relations between the British Empire and the United States, was opposed to the renewal of the treaty in any form. The Australian and New Zealand representatives, on the other hand, who had much to fear from the presence in the Pacific of an unfriendly or offended Japan, recognized in the renewal of the treaty the surest pledge for future peace. The friendship of Japan during the war had undoubtedly been of the greatest service to the British Empire; and the rôle of a Power, such as Great Britain, with over 300 million Asiatic subjects, might well be to act as a connecting link between the United States and Japan, playing to some extent the part played by France after the Anglo-French agreement of 1904 in establishing more friendly relations between Great Britain and Russia.

It fortunately proved unnecessary that the question should be decided forthwith; and in July the invitation of the United
States to the various Powers to attend a general conference later in the year on the subject of disarmament and the political questions connected therewith gave the opportunity for the whole question to be discussed from every point of view. With regard to the question of naval defence the Conference resolved "that, while recognizing the necessity of cooperation . . . to provide such naval defence as may prove to be essential for security, and while holding that equality with the naval strength of any other Power is the minimum suggested for that purpose, this Conference is of opinion that the method and extent of cooperation are matters for the final determination of the several Parliaments concerned, and that any recommendations thereon should be deferred until after the coming conference on disarmament."

It should further be noted that the dominion Prime Ministers attended the Cabinet Council at which the reply to the French note on Upper Silesia was considered. It had been intended to hold a special constitutional conference in 1922, but, having regard to the constitutional developments since 1917, the meeting saw no advantage in holding such a conference. They recognized, however, the necessity of continuous consultation, which could only be facilitated by Imperial Parliaments. The communications between the different parts of the Empire.

Whether or not an Imperial Cabinet, on the model of the Imperial War Cabinet, be found to be practicable, it should be noted that a more elaborate method of solving the problem has been put forward. The "Round Table" movement took its rise from a small body of able and hard-working men who, having helped to bring about the union of South Africa, transferred their energies to the solution of the British imperial problem. A patient and detailed investigation of the whole subject was made by groups of inquirers, mainly belonging to the universities, throughout the Empire; and the results were recorded in carefully annotated volumes. The final outcome of the views of the majority—in most groups there was a dissentient minority—was the volume, The Problem of the Commonwealth, by Lionel Curtis, published in 1917. Though the book bound no one to the author's individual views, it is not likely ever to be superseded as a solution of the problem, from the point of view of an imperial federalist. Whilst the necessity of an Imperial Parliament and Executive was insisted upon, the necessity was also recognized of limiting, as far as was compatible with imperial safety, the functions of such Imperial Parliament and Executive. Dominion nationalism forbade that questions other than the management of foreign affairs, Imperial defence and finance in its relation with defence, along with the control of subject races, should be the province of the central authority. Thus the subject of the tariff was held to be outside its province.

Whatever its logical merits, the proposal failed to secure the support of public men and of the electors in the dominions; largely on the ground that the people of the dominions would never tolerate any form of taxation imposed by a Parliament not sitting within their own borders.

But, though imperial federation be in the existing state of public opinion an impossibility, it does not follow that a satisfactory scheme is not any nearer than it was before the war. The effects of the war seemed indeed in 1921 to be working in two directly opposite directions. On the one hand the war brought about a greater knowledge of Great Britain and its peoples among the many thousands of dominion soldiers who were in England when training or on leave, and had thus created bonds of mutual affection and sympathy. (The feeling embodied in the well-known warning, "No Englishman need apply," is now, we are told, a thing of the past.) Again, the visits of the Prime of Wales to the dominions in 1919-21 called forth an expression of loyalty and devotion to the monarchy, as embodying imperial unity, and to the individual Prince, as embodying in its most attractive shape at once the youth and the democratic spirit of these new nations, such as promised well for the permanence of the British connexion.

Upon the other hand, the war, with its consequences, was, as was inevitable, a forcing-house in the development of the political status of the dominions, and hastened the putting forward of claims which might otherwise have lain dormant for many more years. During the peace negotiations dominion statesmen sat at the council table as representatives of their own communities, and not as mere assessors to the British representatives, their countries being recognized, for certain purposes, as separate states. At the signing of the Peace, King George, in each case, acted on the advice of the minister representing each individual dominion separately. Lastly, the dominions became full members of the League of Nations, undertaking, individually, the serious obligations involved by such membership. These privileges, Sir Robert Borden has explained, were not obtained without struggle; but the opposition in no case came from the British Government.

Moreover, whilst the international position of the British Empire was thus being modified, General Smuts, the protagonist of the movement to reconcile complete local autonomy with the permanence of the Empire, was explaining the measures necessary to make theory to harmonize with practice. (It should be remembered that General Smuts was at the same time denouncing secession as at once a violation of the South African Constitution and the stress of local conditions in South Africa, and perhaps, under the influence of a natural impatience with the situation in Europe, this side of the shield seems to have been less before his attention.

At the Imperial Conference of 1917 it was agreed that the readjustment of the constitutional relations of the component parts of the Empire should form the subject of a special imperial conference, to be summoned as soon as possible after the cessation of hostilities; and it was settled provisionally that the conference should take place in 1922; but it seemed clear by 1921 that the decision following upon the efforts of the war, any immediate attempt to draw closer the bonds of union would not meet with a favourable reception. To judge from the criticisms made on Lord Jellicoe's suggestions, the dominions were not yet prepared to contribute a fixed proportionate quota to the cost of the imperial navy. Underlying, however, this attitude of caution and distrust, there was still in reserve that spirit which made the Empire one in the supreme crisis of its history, the World War.

Other difficulties, besides the constitutional problem, beset the British Empire during the decade. Of these none caused greater anxiety to the imperial statesmen than the situation to British Indians in the British dominions. With regard to immigration, it had become generally recognized in 1921 that each dominion had the right to make, and to enforce, such rules as it deemed necessary for its own individual interests. No sane Englishman would venture to quarrel with the policy of a white Australia, or with the consequences it may entail. Similarly, if the Union of South Africa, with its huge black population, refuses admission to British Indians, no complaint can be made. But it is a matter
of the utmost importance, in the interests of the Empire as a whole, that such Indians as have already found a home there should receive fair and generous treatment. The recognition of a modified form of self-government in India under the system known as "dyarchy" and the extension of representative institutions have greatly stimulated the political consciousness of the peoples of India; and things are now noted and resented which a few years earlier would have been treated as matters of course. The presence of Indian representatives at the Imperial Conferences of 1917 and 1918 served to bring home to the minds of dominion statesmen the new status obtained by India in the British Commonwealth of Nations, and the need for a new spirit in dealing with its population. Rules against Indian immigration could be reconciled with Indian dignity when reciprocal measures by India were not grounded, and the hardships of existing laws with regard to the introduction of the wives of British subjects domiciled, or with regard to facilities for temporary or occasional visits, admit of easy mitigation. More difficult is the question of the franchise. In the past the argument has been that, as Indians had no voice in public affairs at home, they could not resent being treated in a similar way in a dominion. But now that they have begun their political apprenticeship in India itself the case is different; and, at the meeting of the Prime Ministers in 1921, the Indian representatives having laid great stress on the necessity of finding a remedy for this grievance, the conference, "in the interests of the solidarity of the British Commonwealth," recognized the desirability of granting citizenship to Indians lawfully domiciled in a dominion. It is significant, however, that the representatives of South Africa were unable to accept this resolution.

Nor is it in the dominions alone that this difficulty has been encountered. The Highlands of British East Africa (Kenya Colony) have developed into a white man's land, and Kenya is probably on its way to full responsible government. But Indians have for generations resorted to the shores of East Africa, and Indians have held that British East Africa's destiny lay in becoming a field for Indian immigration, under the British flag. The complete failure of such expectations, and the treatment accorded to British Indians in Kenya Colony by the British settlers, have doubtless been a contributory cause in promoting feelings of distrust and suspicion in India.

Under the Peace of Versailles a new form of colonial occupation came into being. It seemed impossible, both in the interests of the natives and for military reasons, to restore to Germany the colonies that had been taken during the war. At the time it did not appear seemly that a war, fought for moral ends, should be followed by a mere division of the spoils. The "mandatory system," therefore, evolved the scheme of which is to enforce the lesson that the possession of colonies, inhabited by savage or semi-civilized peoples, entails moral obligations toward such peoples. Accordingly their tutelage is entrusted to advanced nations who, by reason of their resources, their experience, or geographical position, can best undertake this responsibility, and who thus become mandatories on behalf of the League of Nations. The character of the mandate is differentiated according to the stage of development of the people, the geographical situation of the territory, its economic conditions, and other similar circumstances.

There are three kinds of mandates. Under the first (class A) the mandatory power stands in the position of administrative adviser and assistant until such time as the dependent community may be able to stand alone; its existence as an independent nation being provisionally recognized, subject to the execution by the mandatory of its trust.

In the case of the second form of mandate (class B) the population, as in German East Africa (assigned mainly to Great Britain), was still at the stage in which the mandatory must be exclusively responsible for the administration of the country; under conditions, however, which would guarantee freedom of conscience and religion (subject to the maintenance of public order and morals); the prohibition of abuses, such as the slave trade, traffic in arms or in liquor; and would prevent the establish-
facilities for travel. But the taxation necessitated by the cost of the war, and the increase in prices generally, gave a rude setback in these directions. Conflicts of the air may eventually help to solve the problems of time and space—the Prime Minister at the Conference of 1921 decided upon an extension of wireless telegraphy and on the retention of existing material useful for the development of imperial air communications, but in 1921 the condition of things prevailing had been made less favourable to habits of intercourse between the members of the scattered Empire than it was at the beginning of 1914.

As regards the Crown colonies, likewise, until the changes brought about by the war dealt with above, was one concerned with the development of the existing possessions rather than with the acquisition of new ones. Great attention was paid to the solution of the problems connected with the natives, with, on the whole, satisfactory results; e.g., the recognition by cotton experts that cotton-growing in the Empire can be more successfully carried on under a system of cultivation by small native proprietors than under the system of large plantations owned by Europeans, with its attendant moral dangers, has gone some way to remove the standing crouch of colonial administration—how to combine the due development of the material resources of the countries with the necessary safeguarding of the moral interests of the native populations. Similarly, the treatment of the land question has shown more and more respect for native customs and ideas. The amalgamation of Northern and Southern Nigeria in 1914 enabled the development of the largest British Crown colony or protectorate to be carried on with greater speed and efficiency. In Northern Nigeria, as in the Federated Malay States, a system is at work which, when conditions are favourable, gives admirable results. The native chiefs govern their subjects without the existence of direct communications between the British officials and the people. The difficulty in the way of the employment of this system more generally is that it requires both strong and upright native rulers and British residents of no little tact as well as ability. Whatever be the system of government, it is clear that the interests of a numerous native population must not be abandoned to the will of a small minority of educated and Europeanized natives, who are wholly akin to their countrymen in aims and ideals, any more than they should be the victims of the needs of the few European settlers. The establishment in Nigeria, side by side with an extended executive council, of a new council, including amongst its members the leading colored unofficial representatives both of the European and of the native community, enables the Government to keep in touch with such public opinion as can find expression. A council of this kind may play a useful part, although it has no direct executive or legislative powers. During the war the striking loyalty of the Mohammedan states in Northern Nigeria and the attitude of the natives throughout the British colonies born witness to the soundness of the principles upon which the British native policy has been built. There are, no doubt, serious difficulties in the way. The effects in the more civilised colonies on the fez and ill-assimilated education tend to increase indiscipline and vanity amongst the young; whilst the gradual weakening of the tribal system, and of the authority belonging to the chiefs, is fraught with danger. But the experience of British East Africa has shown that, in a country where the disintegrating forces are exceptionally strong, something may be done by skilful administration to revive the tribal authority and to resuscitate the native tribunals. Everywhere it has been made clear that no form of compulsory labour on behalf of private employers can be tolerated. The question of taxation, with the view of developing the taxation to the British Empire by the native inhabitants, is a problem of some difficulty but one which throughout the Empire, and especially in these days, is receiving the full attention of the Home Government. Attention may be called to the system prevailing in Papua, under the Australian Commonwealth Government, where the proceeds of such taxation are strictly earmarked for purposes connected with the interests of the aborigines.

A marked feature of the period has been the extension of railways which followed upon the financial success of the so-called Uganda railway. In East Africa there has been established a network of railways, steamers and roads, extending into the heart of the Uganda protectorate, and tapping a vast area of country; whilst in West Africa the progress has been no less noticeable.

In the Far East the addition, in the beginning of 1914, of Jolo to the number of the Federated Malay States was an event of importance, the undeveloped resources of the country being great. In no quarter of the world has the British system of government met with more success than in the Malay Peninsula. The wonderful wealth of the country has, no doubt, made things easier; nowhere else could a first-rate railway system have been built entirely out of revenue; and the establishment of the plantation rubber industry upon a large scale, before its introduction to other countries, enabled the pioneers to reap the benefits of high prices. Nor was the British Government unmindful of the interests of the natives, special legislation being passed to prevent them from yielding to their natural inclination to alienate their ancestral holdings to European capitalists. The spontaneous gift of the battle AX "Malaya" to the British navy by the Federated Malay States in 1912 attested the popularity of the British rule; and even more striking were the expressions of loyalty from the Asiatic population at the outbreak of war, followed by a voluntary annual contribution towards its expenses which had the warm support of the unofficial members of the Council. An economic reaction inevitably occurred after the festivities prosperity caused by the high prices that prevailed during the war, but such depression was in no way connected with the system of government.

In the West Indies the years 1910-21 saw few changes of importance. Criticism of existing political conditions had come more to the surface, and proposals were more often heard for the establishment of a federal system of government. In Jamaica the attempt is being made to interest the unofficial members of the Legislative Council more closely in the work of the Government. With regard to federation, the difficulties in its way, in the case of islands separated from each other by hundreds of miles of sea and possessing different forms of government and different ideals and prejudices, remain as great as ever; but the work of the imperial department of agriculture for the West Indies has tended to promote economic development generally; and the agreement, setting on foot a system of reciprocal trade preference, made between Canada and the West Indies in 1917 should be of benefit to the latter.

Parliamentary papers, the Annual Reports from the Crown Colonies and Dominions, Hansard, correspond with A. B. Keith, Imperial Unity and the Dominions (1916), are the best authorities for the last 11 years of the British Empire. With regard to the future form of the Imperial Commonwealth, I. A. S. Jebb, The British Commonwealth (1921), L. Curtis, The Problem of the Commonwealth (1917), and H. Dunne, Hall, The British Commonwealth of Nations (1920) represent different points of view.

(HE E.)

BROADBENT, Sir William Henry, 1st Bart. (1835-1907), English physician, was born at Lindley, Yorks., Jan. 23, 1835, the son of a woollen manufacturer. Educated at Huddersfield, he afterwards studied medicine at Owens College and the Royal School of Medicine, Manchester, and at Paris. From 1859 to 1866 he was physician to St. Mary's hospital, London, and from 1860 to 1870 physician to the London Fever hospital. In 1863 he was created a baronet, and in 1868 became physician extraordinary to Queen Victoria, an office in which he was continued by King Edward VII. Broadbent was an authority on heart affections, and also carried out much research on tuberculosis. His chief works are The Pulse (1896), and The Heart (1897). He died in London July 10, 1907, and was succeeded in the baronetcy by his son, now Sir John Broadbent, Bart. (b. 1868), a distinguished physician.

BROADHURST, Henry (1840-1911), English Labour leader and Liberal politician, was born at Littlemore, near Oxford, April 13, 1840, the son of a stonemason. He was educated at the village school, and at the age of 13 he was apprenticed to his father's trade. He worked at it for nearly twenty years, going to London finally in 1865, where he was employed in the erection of the House of Commons. In 1872 he was elected chairman of the masons' committee during a strike, and from
that time was prominent as a trade union official. In 1875 he was elected secretary of the parliamentary committee of the trade union congress. He entered Parliament in 1880 as Liberal member for Stoke-on-Trent. In 1889 he was elected for the Bordesholm division of Birmingham, and in Feb, 1886 was appointed under-secretary to the Home Office, going out with the Gladstone Government later in the year. He belonged to the older school of trade unionism and was opposed to such demands as an 8-hour day fixed by law. His moderate policy was defeated at the trade union congress of 1890, and he then resigned his secretaryship. Both in 1892 and 1893 he was unsuccessful in his parliamentary candidatures. In 1892 he was appointed a member of the royal commission on Labour, and in 1894 he was elected Liberal member for Leicester, which seat he held until 1905, when he retired on account of ill-health. He died at Cromer Oct. 11 1911. He published the story of his life in 1901, and a book on Leaseshold Enfranchisement in conjunction with Lord Loreburn in 1885.

BROCK, SIR THOMAS (1847 - ), English sculptor (see 4:623), was in 1911 created K.C.B.

BROCKDORF-Rantzau, COUNT ULRICH VON (1860 - ), German diplomatist, was born May 20 1860 at Schleswig. After having held various diplomatic positions at St. Peters burg, Vienna and Budapest he was appointed German minister at Copenhagen, a post which he held from 1910 to 1916. He was very active in the Danish capital during the World War in collecting news and keeping in touch with the various international agencies which were interested in paving the way for peace or endeavouring to undermine the war spirit of the Western Powers. On Dec. 20 1918 he was appointed Secretary of State for Foreign Affairs and in March 1919 went to Versailles as chief of the German delegation for the peace negotiations. He resigned on June 20 in consequence of his unwillingness to advise the German Government to accept the terms of the Treaty of Versailles.

BROKE, SIR CHARLES JOHNSON (1820-1917), 2nd Raja of Sarawak (see 24:208), died at Cirencester May 15 1917. He was succeeded by his eldest son, Charles Vyner Brooke (b. 1871).

BROKE, RUPERT (1887-1915), English poet, was born at Rugby Aug. 3 1887, and educated at Rugby and King's College, Cambridge, where he afterwards won a fellowship. In 1911 he issued his first volume of Poems. In 1913 he undertook a journey through America and to Samoa, sending home vivid letters, which recall those of R. L. Stevenson, to a London evening paper; they were published after his death in volume form, a post which he held from 1910 to 1915 with a prefatory appreciation by Henry James. These two books and a second and posthumous volume of poetry 1914 and other Poems, with an essay on John Webster and the Elizabethan Drama (1916), make up his literary output; but its quality and high promise render the greater the loss to English literature by his premature death on active service. He had joined the Naval Brigade very early in the World War, took part in the ill-fated effort to relieve Antwerp, spent the winter in an English camp and went out to Gallipoli in the spring, but on the way there fell ill of blood-poisoning and died at sea in a French hospital ship April 23 1915. He was buried on the island of Lemnos. His Collected Poems, with a prefaceary memoir by Edward Marsh, were published in 1918.

BROKE, STOPFORD AUGUSTUS (1832-1916), English divine and man of letters (see 4:645), died at Ewhurst, Surr., March 18 1916.

See L. P. Jacks, Life and Letters of Stopford Brooke (1917).

BROOKFIELD, CHARLES HALLAM ELTON (1857-1913), English actor and playwright, was born in London May 15 1857, and educated at Westminster and Trinity College, Cambridge. He studied law for a time at the Inner Temple, though he was never called to the bar, and he was for several years on the staff of the Saturday Review. In 1879 he took to the stage, appearing first in Still Waters Run Deep and becoming a member of the Bancrofts' company at the Haymarket theatre, London, from 1880 to 1885. Later he played there with Herbert Tree in Jim the Pennan, The Red Lamp and other melodramas, as well as in Oscar Wilde's An Ideal Husband. But it was rather as a wit and a writer that his reputation was gained, his stories and motifs becoming famous. He wrote alone, or in collaboration, a number of lively plays, of which the best known was Door Old Charlie, and he published his Random Reminiscences (1902). He also collaborated with his wife, Frances Mary Brookfield, in an account of his parents Mrs. Brookefield and her Circle (1905). Frances M. Brookfield was also the author of The Cambride Apostles (1906) and of some notable novels, especially My Lord of Essex (1907) and A Friar Observant (1908). In 1911 Brookefield was appointed joint-examiner ( censor) of plays under the English University, where he afterwards became professor of humour in view of the character of some of his own plays. He died in London Oct. 20 1913.

BROUGH, FANNY WHITESIDE (1854-1914), English actress, who came of a well-known family of actors, was born in Paris July 8 1854. She first appeared on the stage in Manchester in 1869 in a pantomime written by her uncle, William Brough. In 1879 she appeared in London with Mrs. John Wood at the St. James's theatre. She played in Money with the Bancrofts in 1872, in The Wife's Secret and The Ironmaster with the R Helena in 1888, and in The Man from Brockley with Charles Haverley in 1901 and in the United States in 1903. She died in London Nov. 30 1914.

BUIGHTON, RHODA (1840-1902), English novelist, was born in N. Wales Nov. 29 1810, the daughter of a clergyman, who was squire as well as rector of Broughton, Staffs. She produced her first novel, Comet up as a Foe, in 1867, following it at brief intervals by Not Wisely but too Well and Red as a Rose is She. In the English county society, in which she had been brought up, such novels were then regarded as too daring experiments, to be kept as far as possible out of the hands of the young. But this succès de scandale was short-lived and, as mid-Victorianism began to fade, Miss Broughton's reputation as a shocker of convention soon gave place to a more sober recognition of her merit as a story-teller. "I began life as Zola," she said of herself, "I finish it as Miss Yonge." In the interval she had spent 20 years in Oxford, where she was a distinguished social figure, and the last 30 years at Richmond as a semi-invalid, and she had published some 20 novels, the latest, A Fool in her Folly, appearing after her death, with a prefaceary appreciation by Marie Bellof-Lowndes. She died at Headington near Oxford, June 5 1920.

BROWN, ALEXANDER FRANCIS (1849-1916), American Semitic scholar (see 4:668), died in New York Oct. 15 1916. He had been president of Union Theological Seminary, New York, since 1908. In 1911 he was tried for heresy before the Presbyterian General Board on the ground that he had published statements "contrary to cherished Presbyterian and evangelical doctrines," but was exonerated.

BROWN, JOHN GEORGE (1831-1913), American painter (see 4:661), died in New York City Feb. 8 1913.

BROWN, PETER HUME (1839-1918), Scottish historian, was born in Haddingtonshire Dec. 17 1830, and educated at Edinburgh University, where he afterwards became professor of ancient history. In 1908 he was appointed Historiographer Royal for Scotland, and from 1913 to 1914 Ford lecturer at Oxford. Besides his various histories, he is the author of a Life of John Knox (1893) and is mentioned as an authority in the bibliography of John Knox (see 15:882). He died at Edinburgh Nov. 30 1918; his unfinished Life of Goethe was completed by Lord Haldane and published in 1920.

BROWNE, SIR BENJAMIN CHAPMAN (1839-1917), British engineer, was born at Stout's Hill, Glos., Aug. 26 1839 and apprenticed to the Elswick works near Newcastle-on-Tyne. He became an expert on harbour work and carried out harbour works at Tynemouth, Falmouth and in the Isle of Wight. In 1879 he took over the locomotive works of R. & W. Hawthorn at Forth Banks, in 1886 combined these with those of Andrew Leslie & Co., and until 1916 was chairman of
the combination. He was knighted in 1887. He died at Westacres, Newcastle-on-Tyne, March 1, 1917.

BROWNING, JOHN M. (1854–), American inventor, was born at Ogden, Utah, in 1854, of Mormon parentage. His father was a gunsmith. The son, from childhood, displayed remarkable talent for invention. In 1879 he secured his first patent for a breech-loading single-shot rifle. He made 600 of these guns in his Ogden shop before selling the patent to the Remington Company. He designed many types of sporting firearms such as the Remington autoloading shotguns and rifles; the Winchester repeating shotguns, single-shot and repeating rifles; the Stevens rifles; and the Kyser automatic pistols. From all these large firms were made large numbers of Browning's guns. In 1890 a machine-gun of his design, but known as the Colt, was adopted by the U.S. army. He always avoided publicity and in no case required that his invention bear his name. In one establishment alone was his name used, the Fabrique Nationale at Liége, Belgium, which fell into the hands of the Germans at the beginning of the World War, in 1914. Browning had shortly before been made a chevalier de l'Ordre de Léopold and decorated with King Albert, on the occasion of the completion of the millionth Browning automatic pistol at Liége. He later developed two types of machine-gun which were adopted by the United States for use in World War I. One of these guns on test fired 30,000 rounds before breakage developed. In lieu of royalties, which would have amounted to some $16,000,000, he accepted from the U.S. Government a lump sum of $1,500,000.

Bruce, Sir David (1855– ), British bacteriologist, was born at Melbourne May 25 1855. He was educated at Stirling high school and Edinburgh University, where he took his degree of M.B. in 1881. He entered the R.A.M.C. in 1883, and from 1884 to 1889 served in Malta and Egypt. His stay in Malta was marked by his researches into the origins of Malta fever, and in 1887 he discovered the micro-organism of this disease, propounding the theory that it was spread by the use of goats' milk (see 17,514). In 1889 he became assistant professor of pathology at Netley, and in 1894 went to South Africa, where he remained until 1901, serving throughout the South African War. In 1902 he became a member of the Army Advisory Board, a post which he retained until 1910. For many years Bruce conducted researches into the origin of sleeping-sickness, and in 1894 he discovered the micro-organism not only of that disease but also of nagana (tsetse fly disease), and the method of its check by the United States in 1903 has saved the army in the West. He was appointed to the Royal Society's commission for the investigation of sleeping-sickness, and in 1904 proceeded to Malta to carry on further investigations into Malta fever, returning to Uganda in 1908. In every case a great advance in the study of tropical medicine was the result. From 1911 to 1914 he was in Nyasaland, investigating the possible connexion between human and cattle diseases, and in 1914 became commandant of the Royal Army Medical College, holding the post till 1918. Bruce, who was knighted in 1908, was created K.C.B. in 1918 and retired in 1919. He published many papers on tropical diseases.

Bruce, Sir Gainsford (1834–1912), English judge, was born in 1834. He graduated at Glasgow University and was called to the bar in 1859. He joined the northern and afterwards the north-eastern circuit, and during 1869-1882 reported Admiralty and ecclesiastical cases for the Law Reports. His strength lay in Admiralty law, and he made several contributions to its literature, notably an edition of Williams and Bruce's Admiralty Practice, and the 4th edition of Maude and Pollock on Shipping. He was recorder of Bradford during 1877-92, and successively solicitor-general (1879) and attorney-general (1880) to the county palatine of Durham. A Conservative in politics, he represented Holborn in Parliament from 1888 till he was raised to the bench in 1898. He was made a privy councillor on his retirement in 1904. He died at Bromley, Kent, Feb. 24, 1912.

Bruges, Belgium (see 4,678).—Pop. 53,505 in 1914. In 1914, 685 vessels of 316,000 tons entered the port, and just prior to the World War the improvement of transport between the town and Zeebruggge promised to restore its former prosperity. The Hôtel de Louis de Gruthuysse (who was given the title of Count of Winchester by Edward IV) was converted into a museum of antiquities about 1890.

Up to Oct. 10 1914, Bruges was the headquarters of the British force that was first sent to Belgium after the outbreak of the World War. The town remained some 20 m. behind the German front at Dixmude and was at first of little military importance, but with the growth of submarine warfare and the abandonment of Ostend as a naval base, it became important as a place for the assembling of parts of submarines brought overland from Germany. Capt. Fryatt, of the steam packet "Brussels," was shot in the cavalry barrack of the rue Isabelle on July 27 1914. The town remained in the hands of the Germans until Oct. 19, 1918.

Brunner, Henry (1840-1915), German historian (see 4,675), published in 1909 Geschichte der englischen Rechtsquellen im Grundriss. In 1913 he issued a sixth edition of Grundzüge d' der deutschen Rechtsgeschichte. He died in 1915.

Brunner, Sir John Tomlinson, 1st Bart. (1842–1910), British chemist, was born at Everton near Liverpool Feb. 8 1842, the son of a schoolmaster of Swiss nationality. Educated in his father's school he entered a Liverpool merchant's office in 1857, and in 1873 established, with the distinguished chemist Ludwig Mond (see 18,963), the alkali works at Northwich which became the largest in the world. He was a member of several royal commissions, represented Northwich in Parliament during 1883-6 and again from 1887 to 1909, was created a baronet in 1895 and a privy councillor in 1906. His public benefactions, especially to Northwich and Runcorn, were numerous, and he also gave largely to Liverpool University. He died at Chertsey July 1 1910.

Brunton, Sir Thomas Lauder, Bart. (1844-1916), British physician, was born at Hiltonhill, Roxburgh, March 22 1844, and was educated at Edinburgh University. He graduated M.B. in 1866 and M.D. in 1868, also studying for short periods at Leipzig, Berlin, Vienna and Paris. In 1870 he was appointed assistant physician to St. Bartholomew's hospital, with which he was connected for the rest of his life, both as physician and lecturer. One of his most noteworthy discoveries was the introduction of nitrate of amyl for the relief of angina pectoris (1867). In 1886 he was a member of the commission which investigated the Pasteur discoveries, and in 1889 went to Hyderabad on the invitation of the Nizam to conduct experiments on the results of the administration of chloroform. He was appointed in 1890 and created a baronet in 1908. Later Brunton published various valuable works, including A Text-Book of Pharmacology, Materia Medica and Therapeutics (1892); Lectures on the Action of Medicines (1897) and Therapeutics of the Circulation (1908). He died in London Sept. 16 1916.

Brussels, Belgium (see 4,672).—The pop. of the city proper in 1920 was 1,071,024, showing a decrease since 1910 of 93,645, due to the expropriation and demolition of houses for public improvements. The total pop. of Greater Brussels (comprising ten suburbs and including the recently annexed suburb of Laeken) was 831,906 on Jan. 1 1920. The most populous suburbs at the same date were Schaerbeek 168,590, Ixelles 91,956, Molenbeek, 77,708, St. Gilles 66,716, Laeken 43,729, Forest 32,926.

The various areas comprising the city having certain interests in common, notably the maintenance of police and charitable services, a Conference des bourgmestres, on which 15 communies were represented, was instituted in 1909, but subsequently the unification of areas was resisted by the greater number of the larger communies. A law of April 2 1921, however, initiated by the burgomaster, Adolphe Meyers, decreed the annexation to Brussels proper of the communies of Laeken, Haerem, and Neder Overheembeek, as well as part of Molenbeek, and a small part of Schaerbeek, in order to facilitate the construction of the proposed new outer port which the authorities wished to bring entirely within area of the city proper. As a result, the area of the city proper has more than tripled; it covers 3,286 hectares 94 ares instead of 1,071 hectares 95 ares, and includes an additional pop. of about 4,000,000.

Under the terms of this transformation the old harbour basins were filled in in 1910; the Isabelle quarter of the city, situated between the rue Royale and the Place Royale,
as well as the Potterie quarter near the university, were demolished in order to make room for a new central station, which project, however, was not carried out until 1919. In 1892, the railway junction was abandoned. Numerous banks were established in the upper town—in the rue Royale and Place Royale. In the Schaerbeek area, new arterial roads were made and the Parc Josaphat and Parc de la Villette was opened. The palace of the Count of Flanders became the Banque de Bruxelles, and, in Nov. 1918, the city acquired the palace of the Duc d'Arenburg, and gave it again its old name of Palais d' Egmont.

The harbour works planned in 1886 for making Brussels an inland seaport, including the widening of the canal and the construction of three large basins, the largest of which, the Vergote basin, has never been extended. The project was abandoned in 1915. It being found inadequate, the construction of a vast outer port in the plain between Laeken and Vilvoorde was begun. As an outcome of this undertaking, Laeken was brought within the city area.

The German occupation of the capital during the World War extended from Aug. 1914 to Nov. 1918. General Six von Armin's troops entered on Aug. 20, and on Sept. 2 Field-Marshal von der Goltz was appointed governor-general of Belgium, but was succeeded by General von Bissing in 1915. Numerous social relief movements were instituted outside of German intervention; among them the Comité National de Secours had its headquarters at Brussels, and with the aid of Mr. Hoover's American committee organized the feeding of the Belgian population. On the suppression of Allied newspapers, a patriotic journal, La Libre Belgique, was secretly printed in Brussels and widely circulated during the war, the Germans being unable to discover the press from which it issued. Among the many infamous executions, that of Philippe Bauq and of Nurse Edith Cavell stand out. A revolt of German soldiers against their officers broke out on Nov. 10 1918, and a violent conflict occurred in the Place Roger opposite the Gare du Nord. The Belgian army reoccupied Brussels on Nov. 18, 1918, and the King and Queen reentered the city in state on Nov. 22.

BRUSILLOV, ALEXEI (1866— ), Russian general, was born in 1856. His military career began in the Caucasus. His courage and capacities brought him to notice in the war with Turkey in 1877-8. The greater part of his military life was passed at the cavalry school for officers in St. Peters burg, of which he became director in 1900. Well acquainted with cavalry technique, of great erudition, he was very useful in this capacity. In 1906 General Brusilov commanded the second guard cavalry division, in 1909 the first guard corps, and in 1913 was made assistant to the commander-in-chief of the Warsaw military district. At the beginning of the World War he was nominated commander of the Russian VIII. Army, which acted with brilliant success in Galicia in 1914 and 1915. General Brusilov's reputation grew steadily, and in the winter of 1915-6 he was called to the command of the armies of the south-western front. During the summer of this year he conducted the great offensive in Galicia, which resulted in the capture of over 430,000 prisoners, with enormous booty and trophies, and the relief of the Italian army by the withdrawal of considerable enemy forces thence to meet the crisis of Lutsk. In May 1917 after the revolution he was appointed to the supreme command, but he did not hold the appointment long. Later, he accepted the Bolshevik régime, and was often, though erroneously, reported to be in supreme command of the Bolshevik armies during the wars of 1919-20.

BRYAN, WILLIAM JENNINGS (1860— ), American political leader (see 4.607), announced that he was not a candidate for the Democratic presidential nomination in 1912, but he attended the Democratic convention, and it was largely owing to his personal influence and his large popular following that the nomination of Mr. Wilson, who was not recognized by the party as a candidate, was secured by President Wilson Secretary of State, and from the start devoted much attention to the negotiation of peace treaties with foreign countries. He declared that America should wage no war while he was Secretary. Soon after entering office he went to California and urged, unsuccessfully, that the state legislature and the governor delay action on the proposed Webb anti-land ownership bill, so displeasing to the Japanese Government. In 1914 he supported the repeal of the Panama Canal tolls bill, which excluded American coastwise shipping from the payment of fees. After the outbreak of the World War he was deeply interested in attempts to restore peace. His attitude toward foreign war loans was clearly expressed in an announcement from the Department of State (Aug. 15 1914), that 'There is no reason why loans should not be made to the governments of neutral nations, but in the judgment of this Government loans by American bankers to any foreign nation which is in a combat with the true spirit of neutrality.' When, however, in Dec. of the same year, Senator Hitchcock introduced a bill to lay an embargo on the shipment of arms, the Secretary informed the British ambassador that it had not been introduced "at the suggestion of the administration"; and later, in 1915, in a letter "to the German Americans" he declared that it would have been in violation of the laws of neutrality to change international rules during war by forbidding the exportation of arms. After the sinking of the "Lusitania," in 1915, he signed the first strong note of protest to Germany. Upon the receipt of the German reply, and while the second note was being prepared, Dr. Dumba, the ambassador of Austria-Hungary, called at the Department of State and asked Secretary Bryan why the United States dealt more harshly with Germany than with Great Britain. The Secretary replied that Great Britain had only interfered with the commerce of the United States while Germany had drowned its citizens. This plain statement was ignorantly or wantonly misinterpreted by some German official, and the report was widely spread that Mr. Bryan had said that the note was for "home consumption," and not to be taken too seriously. There was, however, absolutely no truth in this at all, even Dr. Dumba denying it in a dispatch to his Government. When the President wrote his second "Lusitania" note, Secretary Bryan resigned, June 8 1915, saying in his letter of resignation: "You have prepared for transmission to the German Government a note in which I cannot join without violating what I deem to be an obligation to my country."

During his term of office he had negotiated 30 treaties with foreign nations, requiring the submission of disputes to impartial inquiry and a delay of a full year for arbitration before going to war. Such a treaty had not been concluded with Germany, but was under consideration when interrupted by the World War. As Secretary he was often criticized because of his numerous public engagements on the lecture platform, undertaken, he said, to supplement his inadequate salary; but it was never shown that he was less attentive to the demands of his office than any predecessor. He continued, after his resignation, to work in the interests of peace; opposed the Anglo-French war loan; attacked the Navy League and the National Security League; and tried to resist the growing demand for preparedness in America. In 1916 he was defeated in Nebraska as candidate for delegate-at-large to the Democratic National Convention. He went, however, as a reporter and gave full support for the renomination and later the re-election of President Wilson. From the announcement by Germany of the resumption of submarine warfare to the actual declaration of war, he favoured any measure that would keep America out of war no matter how largely it involved the surrender of American rights on the sea. But when war was declared he asked to be enrolled as a private, though then 57 years of age; urged loyal support of the President's war measures; and in his own paper, The Commoner, strongly condemned obstruction of the selective draft as well as abuse of liberty of speech. He supported the League of Nations but thought that the Monroe Doctrine should be maintained. He was recognized as a candidate for the presidency by President Wilson Secretary of State, and from the start devoted much attention to the negotiation of peace treaties with foreign countries. He declared that America should wage no war while he was Secretary. Soon after entering office he went to California and urged, unsuccessfully, that the state legislature and the governor delay action on the proposed Webb anti-land ownership bill, so displeasing to the Japanese Government. In 1914 he supported the repeal of the
declared that he would not leave the party. For the most important “progressive” measures adopted by the United States in recent years, the popular election of senators, an income tax, the requirement of publication of ownership and circulation by newspapers, the creation of a Department of Labor, national prohibition and woman suffrage, Bryant laboured earnestly, and their adoption was due in part at least to his popular persistent appeal.

**BRYANT, SOPHIE (1830-1913), British educationist,** was born in Dublin Feb. 15 1820, the daughter of the Rev. W. A. Willock. She was educated privately, but later gained a scholarship to Bedford College, London, where she graduated with honours in mathematics and moral science in 1851 (see 4699). In 1850 she married Dr. William Hicks Bryant, of Plymouth, but on his death a year later resumed her work, and in 1854 took the degree of D.C.sc. in moral science, being the first woman to take that degree. In 1875 she became mathematical mistress at the North London Collegiate school for girls, and in 1895 succeeded Miss Buss as its headmistress. Dr. Bryant served on the royal commission on secondary education (1894), and was a member of various educational committees. She retired from her post at the North London Collegiate school in 1918.

She published, besides many articles on scientific and educational subjects, *Educational Ends* (1887); *The Teaching of Morality in the Family and the School* (1887) and *How to Read the Bible in the Twentieth Century* (1918); besides *Celtic Ireland* (1889), and *The Genius of the Gael* (1913).

**BRYCE, JAMES BRYCE, 1ST VISCOUNT (1838-1921), British jurist, historian, politician and diplomatist (see 4699),** remained in the United States as British ambassador till 1913, a period of six years. The appointment, criticised at the time as withdrawing from the regular diplomatic corps one of its most coveted posts, proved a great success. The United States had been in the habit of sending, as minister or ambassador to the Court of St. James's, one of its leading citizens—a statesman, a man of letters, or a lawyer—whose name and reputation were already well known in Great Britain. For the first time Great Britain responded in kind. Mr. Bryce, already favourably regarded in America as the author of a classical work on the American Commonwealth, made himself thoroughly at home in the country; and, after the fashion of American ministers or ambassadors in England, he took up with eagerness and success the rôle of public orator on matters outside party politics, so far as his diplomatic duties permitted. These duties he performed to the satisfaction of his own Government and the Government to which he was accredited. The difficulty between America and Newfoundland about fisheries was referred to the Hague Tribunal for final settlement. Most of the questions with which he had to deal related to the relations between the United States and Canada, and in this connexion he paid several visits to Canada to confer with the governor-general and his ministers.

He was criticised, both in England and in Canada, for forwarding, in 1911, in the course of his duties as ambassador, an arrangement for reciprocity between the two North American states; but the general election, which substituted Sir R. Borden as Prime Minister of Canada for Sir W. Laurier, put an end to the negotiations. At the time he told the Canadians that probably three-fourths of the business of the British embassy at Washington was Canadian, and of the 11 or 12 treaties he had signed nine had been treaties relating to the affairs of Canada. “By those nine treaties,” he said, “we have, I hope, dealt with all the questions that are likely to arise between the United States and Canada—questions relating to boundary; questions relating to the disposal and the use of boundary waters; questions relating to the fisheries in the international waters where the two countries adjoin one another; questions relating to the interests which we have in sealing in the Behring Sea, and many other matters.” He could boast that he had left the relations between the United States and Canada on an excellent footing.

For his services he was created a viscount in 1913, and in 1914 his old university, Oxford, gave him an honorary degree.

Along with other English scholars, who had ties of close association with German learned and German savants, he was extremely reluctant in the last days of July 1914 to contemplate the possibility of war with Germany; but the violation of Belgian neutrality and the outrages committed in Belgium by German troops brought him speedily into line with national feeling. He was appointed chairman of a strong committee to consider the evidence of such outrages not only in Belgium but in France; and his report convinced the most incredulous of the reality of the charges. He welcomed warmly the entrance of the Americans into the war in the spring of 1917. He also presided, as an eminent constitutional lawyer, over a committee set up in that year to examine the construction of the House of Lords, and spent much labour in a task which all parties were disposed to shirk. During these latter years he was largely engaged on the composition of a valuable book, published in two substantial volumes, in 1921, on *Modern Democracies*, a comparative study of a certain number of popular governments in their actual working. For this monumental work he had been gathering material for several years before the war. Besides visiting Switzerland and other parts of Europe, he availed himself of his experiences in the United States and in Canada, and journeyed to Spanish America, Australia and New Zealand. Lord Bryce married, in 1889, Elizabeth Margaret, daughter of the Hon. Thomas Ashton, of Hyde, and sister of the 1st Lord Ashton of Hyde. He was appointed O.M. in 1909 and G.C.V.O. in 1918.

**BUCKLECH, WILLIAM HENRY WALTER MONTAGU-DOUGLAS-SCOTT, 6TH DUKE OF (1831-1914), British politician (see 4712),** died at Montagu House, Whitehall, Nov. 5 1914. He married in 1859 Lady Louisa Hamilton, daughter of the 1st Duke of Abercorn, and one of the seven sisters depicted by Disraeli in *Lothair.* She was an intimate friend of the royal family, and was mistress of the robes to Queen Victoria and Queen Alexandra. She died at Dulkeith March 17 1912.

**BUCHAN, ALEXANDER (1829-1907), British meteorologist,** was born at Kinnesswood, Kinross, April 11 1829. He was educated at the Free Church normal school and the university of Edinburgh. From 1848 to 1860 he worked as a teacher, but in 1860 was appointed secretary to the Scottish Meteorological Society, and in 1869 published his first series of monthly charts showing the mean distribution of atmospheric pressure over the globe, which remained for many years a landmark in the progress of meteorology. In 1878 he became curator of the library of the Royal Society of Edinburgh, and in 1887 a member of the meteorological council of the Royal Society. He published a *Handy Book of Meteorology* (1867); *Introduction to the Textbook of Meteorology* (1871); besides a report on *The Weather and Health of London* (with Sir Arthur Mitchell), and edited sections on *Oceanic Circulation* (1859) and the volume on *Atmospheric Circulation* (1889) in the voyage of H.M.S. “Challenger.” He received the Makkouglall-Brshlaine prize (1872) and the Gunn ing Victoria Jubilee prize (1893) of the Royal Society of Edinburgh, besides the Syms medal of the Royal Meteorological Society, and was elected a fellow of the Royal Society in 1898. He died at Edinburgh May 13 1907.

**BUCHAN, JOHN (1875—), British author,** was born at Dunfermline, Fife, son of a churchman, and educated at the Universities of Edinburgh and Glasgow. He was educated at Glasgow University and Brasenose College, Oxford, where he won the Stanhope historical essay prize (1892) and the Newdigate prize for poetry (1898), and graduating first class in *Hiera humaniores* (1896). In 1901 he became private secretary to Lord Milner, then High Commissioner for South Africa, and remained with him till 1903. In 1906 he joined the Edinburgh publishing firm of Thomas Nelson & Sons. Even as an undergraduate he had “commenced author” with *Sir Quixote* (1895), and he followed this with other tales and novels. His African experiences suggested *The African Colony* (1901), *A Lodge in the Wilderness* (1906), and *Proser John* (1909). During the World War he served with the headquarters staff of the British army in France (1916–7), attaining the rank of colonel, and later was Director of Information under the Prime Minister (1917–8), and his *History of
the War (Nelson) was an admirable piece of work. He wrote too some excellent tales of adventure, notably The Thirty-Nine Steps (1915) and Greenmantle (1916). Later works include The South African Forces in France (1920), and a biography of Francis and Riverdale Grenfell (1920).

Buckle, George Earle (1854- ), English editor and man of letters, was born at Tiverton-on-Avon, Som., June 10, 1854, eldest son of Canon George Buckle of Wells. He was educated at Winchester and New College, Oxford, being a scholar of his college, and graduated first class both in literae humaniores (1876) and in modern history (1877). He won the Newdigate prize poem in 1875. In 1877 he was elected to a fellowship at All Souls College, which he held until 1885. In 1880 he joined the staff of The Times; four years later, at the age of thirty, he succeeded Thomas Chenery as its editor. This position he occupied for nearly thirty years, retiring in Aug. 1912. When Mr. Monypenny, the biographer originally entrusted with the official Life of Disraeli, died in 1912 leaving his task unfinished, Mr. Buckle took over the work of completing it; under his authorship vol. 5 was published in 1914, vol. 4 in 1916, and the concluding vols. 5 and 6 in 1920.

Buckmaster, Stanley Owen Buckmaster, 1st Baron (1861- ), English lawyer and politician, was born at Wands- worth Jan. 9 1861. He was educated at Christ Church, Oxford, and in 1884 was called to the bar, becoming a K.C. in 1902. He entered politics as a Liberal, and in 1906 was elected M.P. for Cambridge. In 1910 he lost his seat, but in 1911 was elected for the King's Lynn division of Yorks., and the same year became counsel to Oxford University. In 1913 he was made solicitor-general and knitted. He was from Sept. 1914 to May 1915 director of the Press Bureau. In the latter year he was Lord Chancellor, being raised to the peerage, but was displaced on the fall of the Asquith Government in 1916.

Buckner, Simon Bolivar (1823-1914), American soldier and political leader (see 4.732), died in Munfordville, Ky., Jan. 8 1914. He was the last surviving major-general of the Confederacy and the then oldest living graduate of West Point.

Buckingh, Sir Thomas Townsend (1815-1913), English judge, was born at Examinator April 18 1815, the son of Sir John Charles Buckingh (1877-1897), a famous chemist and politician. He was educated at Westminster school, and afterwards at Geneva. He was called to the bar in 1888, became a Q.C. in 1885, and a bencher of the Inner Temple in 1891. From 1885 to 1899 he was recorder of Exeter. He sat as Conservative member for Mid-Surrey from 1892 to 1899, in which year he was raised to the bench and knighted. He died at Epsom Oct. 4 1913.

Budapest (see 4.734).—In 1910 the civil pop. of Budapest was 563,735, showing an increase of 29.55% in the decade. To this must be added a garrison of 16,636 men, making a total pop. of 880,371. Of the total pop. 736,070 were Magyars, 78,882 Germans, 20,350 Slovaks and the small remainder was composed of Poles, Ruthenians, Serbs, Croats, Romanians, and others. According to religion there were 526,175 Roman Catholics, 94,828 Greek Catholics, 6,662 Greek Orthodox, 86,990 were Protestants of the Helvetic and 43,592 of the Augsburg Confessions, 203,687 were Jews and the remainder belonged to various other creeds. During the World War the extraordinary increase in the population of Budapest diminished, the census Jan. 1 1921 showing a pop. of 1,164,616.

In the years immediately preceding the war there were over 6,000 students at the university, and from 4,000 to 5,000 at the Polytechnic Institute. The new faculty of the political economy was founded at the university in 1919, and the Geological and Meteorological Institutes are also of recent foundation.

The new Tiber rampart in Romangus-Gothic transition style, with a bronze statue of St. Stephen, rises round the Matthias church. At the N. extremity of the fortress is the Gothic building of the National Archives, unfinished in 1921.

The development of Budapest came to a standstill during the war, and the lack of housing accommodation caused great distress among the increased population. The city suffered severely during the Bolshevik ascendency, and many robberies were committed by the Rumanian troops who occupied it in disregard of the decisions of the other Allied Powers (see HUNGARY). Fortunately, the English, American, and Italian missions prevented the sacking of the museums and art galleries.

See Eugen Cholnoky, "The Geography of the City of Budapest," Budapest: Hungarian Social Science, 1914-20, and "

Budge, Sir Ernest Alfred Wallis (1857- ), English archaeologist, was born in Cornwall July 27 1857 and educated at Chini's College, Cambridge, where he became Assyrian scholar and Tythribb Hebrew scholar. In 1885 he became keeper of the Egyptian and Assyrian antiquities in the British Museum, and he conducted excavations at Assuan, at Gebel Barkal on the island of Meroe (the seat of the capital of ancient Ethiopia), at Nineveh and Der in Mesopotamia (1888-9) and in the Sudan, when the ancient monuments on the banks of the Nile were threatened with inundation by the raising of the Assuan dam. His long list of publications include The Gods of Egypt (1905); The Egyptian Sudan (1907); The Nile (1912; 12th ed. 1912); Literature of the Ancient Egyptians (1914); By Nile and Tigris (1920), and very many others. He was knighted in 1920.

Buenos Aires (see 4.735) continued to be in 1921 the largest city in Latin America, the largest city in the world south of the equator and the fourth city in the two Americas, being exceeded only by New York, Chicago and Philadelphia in the order named. In total shipping, Buenos Aires ranks as the second port in the two Americas, coming directly after New York. The pop. in 1920 was 3,909,441, an increase of 486,579 or 38% since 1910, when Buenos Aires had 3,422,862 inhabitants, and an increase since 1914 of 184,062 or 5.5%. It will be seen that the relative growth for the period 1914-20 was not so great as previously. This is partly accounted for by the fact that between 1914 and 1918 there was a balance against Argentinia in migration of 213,000 people; however, this movement turned the other way in 1919, and in 1920 the balance resulted in favour of Argentina by 30,800. A large proportion of immigrants remain in Buenos Aires, in spite of the efforts of the Argentine Government to distribute them. In 1919, only 6,875 building permits were granted, as against 19,358 in 1910.

The celebration of the Argentine Centenary in 1910 in Buenos Aires was government sponsored not only from all Argentina, but also from abroad. In 1913 new diagonal avenues were begun, the plan being to change the rectangular pattern which had been followed since the colonial period by cutting diagonal avenues through the city on the model of Washington D.C. The two avenues radiate from the corners of the central Plaza del Mayo, formerly the chief central square of the city. In 1921 only about five blocks of each of these avenues had been completed, the World War putting a stop to the extensive development. The building boom, however, involved the widening of alternate streets coming from the river and the demolition of many of the older parts of the city. The widening of the city proper was the Rio de la Plata was greatly improved during the years 1910-20, much land was reclaimed from the river, and a new post-office and custom-house were erected on this waterfront, adding greatly to its beauty. The centenary gifts of various nations to Argentina alone important parts of Buenos Aires. Among them may be especially mentioned the handsome clock tower erected by the British colony at a cost of £100,000, which stands opposite the new railway station opened in 1916 (the largest railway station in South America). The great church of Our Lady of the Angels built in Palermo Park erected by the U.S. colony, and other statues from the French, Syrian and other foreign communities. The statue erected by the Spanish colony in Palermo Park is particularly beautiful.

The Congress building was finished in 1912 and the park in front of it, the Plaza del Congreso, covering three city blocks, was opened for the centenary celebrations in 1910, over $50,000 having been spent.

Buenos Aires transacts approximately 80% of the entire foreign trade of the republic. It continues to be preeminently the banking, as also the industrial centre of the country. The first branch of a U.S. national bank ever established abroad was opened in Buenos Aires Nov. 10 1914, by the National City Bank of New York. Since then two other U.S. banking institutions have opened branches here. The number of U.S. banking houses in Buenos Aires increased from 10 in 1910 to 20 in 1920, while the British and French firms and those representing other Allied countries also became more numerous. The war was very injurious to German
enterprises in Buenos Aires, many of them practically going out of business.

Other improvements in the decade 1910-20 were the erection of a number of thoroughly modern hotels and of a greatly improved improved system of public parks and playgrounds, the construction of several new school buildings; the extension and enlargement of the medical faculty of the university of Buenos Aires; and the erection of the large building which houses its faculty of commerce in an handsome structure and several buildings have been erected and a new subway was installed in 1912 by a German firm. Several large modern office buildings have been put up since 1916, chiefly with English capital, and new department stores, among which the English capital of 11. C.

BUFFALO (see 4,754.)—The population in 1920 was 506,775, an increase of 83,000 or 18.6% for the decade, as compared with 71,328 and 20.2% for the preceding decade. The death-rate of Buffalo in 1920 was 12.8, the average from 1900 to 1920, 15.18. In 1914 a new commission charter was adopted which did away with the bicameral city council and mayor formerly in existence. The first commission council took office Jan. 1 1916.

The citizens choose by direct non-partisan nomination and election a mayor and four councilmen. These constitute the sole legislative body and are also the The executive heads, the J. No. 16 ex officio the head of the departments of fire, police and health, which comprise the Department of Public Safety. The four other department heads are Accountant, Parks, Public Buildings, and Public Affairs. A councilman is appointed as head of each of these departments. The principal subordinate officials are nominated by the mayor and appointed by the council. The mayor has no veto power, but all of the police and fire appropriations for purposes outside city expenses may be referred to vote of the people on petition of 5% of the citizens who voted at the last regular election for mayor.

The city council is under a board of education appointed by the mayor and council, but subject mainly to state laws. The city court, consisting of a chief judge and seven associate judges, is also under state laws. A technical and four other high schools were built between 1902 and 1920. The sum of $8,000,000 was appropriated for new grammar schools in 1919. The university of Buffalo was given an endowment fund of $5,200,000, raised by popular subscription, in 1902. In 1906 the 77th Ward, the northern part of the city, to which 44 ac. were added in 1919. Canisius College (Jesuit) also, in 1920, raised by popular subscription an endowment fund of $1,000,000. D'Youville College for women (Roman Catholic) was opened in 1908. Among important new structures may be mentioned: Marine Trust Co., Erie County Savings Bank, New York Telephone, Electric, Iroquois and Y.M.C.A. buildings. The new city hospital was under process of construction in 1920. The new Erie canal, rebuilt by the state as a large canal at a cost of $10,000,000, was completed for exporting coal to the lake, and the transportation to the seaboard for large to 2,000 tons capacity and draining not more than 12 ft. of water, adding greatly to the real estate market. The city completed in 1915 a new pumping station with 1,000,000 gal. capacity at South Buffalo, 6,500,000 new investments, to provide water from Lake Erie. The capacity of the plant is 150,000,000 gal. each 24 hours.

The city's greatest growth in twenty years has been in manufactures. It has very diversified industries, producing 58% of all the different lines of goods recognized by the United States Census Bureau. Among the chief manufactures are: iron and steel products, metal products, soap, cars, flour, lumber, lined metal, clothing, automobiles, etc.

The grain elevators in Buffalo harbor had in 1920 a capacity of 28,500,000 bushels. The receipts of grain by lake boat in 1920 were 108,825,000 bushels and the receipts of flour at the flour elevators were 93,325,000 bushels. More than 20,000 carloads of live stock are handled yearly in the stockyards at East Buffalo. Other important articles of commerce are: iron ore, in which Buffalo stands second in receipts among lake ports; coal, flax-seed, manufactured iron and steel and lumber.

Buffalo furnished over 10,000 volunteers and selected service men to the U.S. army in the World War. The greater number of these served in the 77th and 78th divisions and had an active part in the Argonne and other battles. In addition, the 77th Infantry, N.G.S.N.Y., became the 108th Infantry in the United States service; the Third Field Artillery, N.G.S.N.Y., became the 106th Field Artillery; Troop I, N.G.S.N.Y., became the 102nd Trench Machine Battery, and Base Hospital No. 23 was recruited in Buffalo. The 108th regiment, forming a part of the 27th division, participated in the breaking of the Hindenburg line near Le Cateau, France, Sept. 29—Oct. 1 1918.

The 166th Field Artillery and 102nd Trench Mortar Battery were in the battle of the Argonne. Nearly 4,000 Buffalo men served in the navy and about 1,000 in the U.S. marine corps. The city was also the base of operations for the American volunteers for the Polish army. The Buffalo men who died for the war numbered 966.

Recent important books on the history of the city are History of Buffalo (1911) by J. N. Larned, and An Old Frontier of France (1917) by F. H. Severance. (M. W. W.)

BULGARIA (see 4,772).—Political History 1908-12.—The condition of Macedonia and Thrace, which since the Treaty of Berlin in 1878 had been a constant source of anxiety and difficulties for Bulgaria, became even worse under the régime of the Young Turks. The Serbs, whose hopes of reunion with the rest of Serbia were raised by the Ottoman Empire, were destroyed by the annexation of Bosnia and the Herzegovina by Austria-Hungary in 1908, began to seek expansion in Macedonia towards the Aegean. Rival bands of Serbs, Greeks, Bulgars, Wallachs, Albanians and Turks now carried on the propaganda of their respective nationalities in Macedonia by force of arms, and the life of the peasant became unbearable.

The perpetual menace of war with Turkey and, latterly, the strained relations with Greece and Serbia, entailed on Bulgaria a military expenditure which in 1909 was proportionately higher than that of any other European state. Bulgaria was obliged, and was also tempted to support those of her rivals which escaped over her frontier from Turkish territory; current conciliatory methods stated that the Bulgarian population of Macedonia had diminished to a quarter of what it had been 15 years earlier. There was again a fear that the Young Turks meant to exterminate the Bulgars of Thrace and Macedonia altogether, and the Macedonians living in Sofia, many of whom were men of ability and influence, were continually urging the Government to take energetic steps with regard to Macedonia.

The Balkan Alliance.—In March 1911, the Malinov Cabinet fell at the hands of the Balkanists, who had been voted into office in the hope of securing the annexation of Macedonia. Balkan statesmen were slow to realize that it was to their common interest to put an end to the troubles in Macedonia, and that this could be done only by joint action. In the winter of 1910-11, negotiations in this direction were begun at Athens between Bulgaria and Greece, the first negotiations taking the form of private conversations between J. D. Bourchier, principal Times correspondent in the Balkans, and Venizelos. Eventually, Venizelos entrusted Bourchier with the transmission to King Ferdinand of a definite proposal which was known only to King George, Venizelos and Bourchier; the greatest secrecy was observed throughout, even in the presence of ministers. On Nov. 25, 1911, the Grand Sorbaniya empowered the Government to make secret treaties without submitting them to the Sorbaniya. In May 1912, a treaty of defensive alliance between Bulgaria and Greece was signed, and the son of Ali Effendi, who had been expelled a few months earlier, was restored to his position. Meanwhile, negotiations had also taken place between Bulgaria and Serbia, and in Oct. 1911, the Serbian premier, Milovanovitch, and Guevich came to a general agreement as to terms of an alliance. The negotiations with Serbia proved difficult. throughout. The Bulgars were in favour of autonomy for Macedonia; the Serbs, in favour of dividing the country into three zones, an uncontested Serbian zone, an uncontested Bulgarian zone and a contested zone; the fate of which should be left to the arbitration of the Tsar of Russia. After much discussion in which both sides showed an uncompromising spirit, a treaty of friendship and alliance, between Bulgaria and Serbia, was signed in Maceba in July 1912. In this treaty Serbia recognized “the right of Bulgaria to the territory E. of the Rhodope Mountains and the river Struma”; while Bulgaria recognized “a similar right of Serbia to the territory N. of these mountains.” The accord of the two monarchs was followed by a series of joint military exercises and patrols. Under the treaty of Aug. 1, 1912, the exchange of the Bulgarians of Macedonia was to be arranged in the following manner: the two states bound themselves to accept an agreed line running southwestwards from Golem Mountain to Ochrida Lake, south of the Tsar of Russia pronounced in favour of this line. Russia was kept informed of the negotiations; the Tsar's Government, while it welcomed the development of the relations between the two states, disapproved of some of the Polish events which had occurred in and around the city, the Young Turk Government fell; a serious Albanian rising led to the concession of a measure of autonomy to the Albanians; there was a bomb outrage at Koclen, followed by a massacre of both natives and refugees. The Young Turks, who had hoped to secure the annexation of Macedonia by force of arms, proposed with the new leaders of the revolt, the鲁能s and the Armenian missionaries, to organize Turkish military manoeuvres near Adrianople. The Great Powers, which had been the autumn became aware of the Balkan alliance, made efforts to prevent the outbreak of war, which culminated in a proposal from Austria-Hungary that the Powers should guarantee
BULGARIA

517

The autonomy of Macedonia. Unfortunately, the offer came many years too late. On Sept. 30, the Balkan allies ordered the mobilization of their armies, and on Oct. 8 Montenegro, with which country

Bulgaria had not been formally left to arbitrate.

On Oct. 13, the allied Balkan Powers sent a virtual ultimatum to the Porte; on Oct. 17, Turkey declared war on Serbia and Bul-

First Balkan War 1912.-The war with Turkey was popular throughout the country, for the people of Bulgaria, though they are often represented as self-centred and materialistic, had felt the

Turkish oppression and many had been prepared for any sacrifice in order to set them free. The campaign in Thrace brought out once more the admirable qualities of the Bulgarian soldier, his power of endurance, his courage and his obedience, and the campaign had been achieved after the armies had been less complete and satisfactory than it appeared to be in press

The Bulgars, it is true, forced the Turkish army back in disorder, after severe fighting near Kirk-Kilisse and Lukovit, to the defensive position of the Chatafla lines; but, owing to the lack of heavy artillery, they failed to capture Adrianople and proved unable to force the Chatafla lines and so to advance on Constantinople. For all its supplies, the army was dependent on transports; nearly every cart and draught animal in Bulgaria had been re-

quired. The rough tracks by which supplies had to travel had been rendered almost impassable by rains, and it was fully ten days' travel from the Nea Vareni to Elati-Dor. As a result of this, on the mortality among the draught animals. The enforced pause, whilst the army was waiting for supplies to come up, twice gave the Turks time to withdraw and finally permitted them to re-group for a final

Bulgarian campaign. Such great short-comings in the medical and supply services, and the Bulgars suffered only a degree less cruelly than the Turks themselves from shortage of food. The occupation of the Chatafla, which cost the Bulgars some 10,000 casualties, were undertaken contrary to the advice of Fichef, chief of staff, and were inspired by Ferdinand, his ambition was to take Con-

stantinople on the first occasion, his countrymen had been told, and the troops were too much exhausted after the five weeks' fighting in Thrace to follow up their success to complete victory, was com-

pleted by the King to ask for sick leave and was succeeded by Nebenius.

On Dec. 4 an armistice between Turkey, Bulgaria and Serbia was signed. At this moment the position was everywhere favourable to the Bulgars. The Serbs had already occupied most of eastern Macedonia and held Salonika. The Serbs, after heavy fighting at Kumanovo and Prilep, had taken Monastir, and the Turkish army had retreated into Albania. The Turkish fortress of Scutari, Yanina and Adrianople still held out, but their garrison were suffering from shortage of supplies. The sig-
natories of the armistice met in London to arrange terms of peace.

The Bulgars, demands, which included the cession of Adrianople and the surrounding country, the cession of the Dardanelles, the occupation of Scutari, the surrender of Serbs, and the occupation of Adrianople, the Turks sought the mediation of the Powers, and after another conference in London, the delegates were, on May 30 1913, induced to sign a treaty, the terms of which had been drafted by Russian, British and French diplomats, the Bulgars and

Greek official figures of their respective casualties were given as

31,000 and 29,000.

Bulgarian Alliance.—The discussions at the conferences in London had shown that considerable friction existed between the

allies. Apart from the antagonism of national character and the mutual distrust and dislike, which events in Macedonia during the last few years had encreased, the day and manner in which they had arisen. To this, the treaties should be revised as a whole, and the arbitration of the Tsar should be sought for in all matters of dispute. The Bulgars charged Serbia with having interferred to unite Serbs and King Constantine and described the Tsar as the men of moderate and prudent views, met in the hope of coming to an agreement; on the same day a treaty was signed at Salonika between Serbia and Greece. During the month of June the Tsar of Russia, after the discussion of the question at length and through his diplomatic representatives, Hartwig at Belgrade and Neklidov at Sofia, to prevent the outbreak of hostilities, but Ferdinand’s replies to the Tsar’s proffered mediation showed an increasing estrangement. The meeting of the Powers at Constantino-

lum. The conference at London was opened on June 29, and the

counselling of moderation and the Tsar told the Bulgarian king and his ministers that the Powers had unanimously agreed that, on July 1, must count as evidence that the Serbs were fully alive to the

circumstances of the King. On July 1 Savov forbade further hostilities; he himself was recalled a few days later. It was then officially stated that the

ranks of Bulgaria was based on the mission to Macedonia. On July 1, Savov asserted that the King himself, as commander-in-chief,
gave the order to attack. The war which was so rashly and unjustifiably started by the Bulgarians ended in disaster for them. They lost their troops on their own soil in July, and then on July to the Rumanians, who had given previous warning of their intentions, crossed the Danube and advanced unopposed on Sofia. A few days later the Turkish newspaper, Adria, reported that a Stambulov cabinet was formed, with Radoslavov as prime minister, Bulgaria was thus closed in by four enemies at once and had no choice but to submit unconditionally to the Turkish demands. On July 29 the Turks, after a two-month siege of the city of the Bucharest. The failure of Bulgarian arms in the second Balkan War was due to several causes. The moral of the troops had suffered owing to the prolongation of the campaign in Thrace and discontent had arisen among the foot-soldiers as a result of the hot weather from Thrace to Macedonia immediately before hostilities, while many had no inclination to fight against their late allies and brother Slavs. The war was the work of politicians rather than of a nation, and thus the troops resented the strength of the Serbian and Greek forces, and they had imagined that if once both these armies could be driven out of territory which had been assigned to Bulgaria by Article 2 of the secret annex to the Serbo-Bulgarian Treaty of 1912, the Powers would acquiesce in a Bulgarian occupation of that part of Macedonia, and also of Salonika. The civil population of southern Macedonia suffered cruelly, and Montenegro and Balkan War; atrocities were committed both by Greeks and Bulgarians.

Treaty of Bucharest.—This treaty, which was signed on Aug. 10 1913 after a fortnight’s conference, deprived Bulgaria of almost all her territorial gains of the first Balkan War and also of any immediate prospect of the reunification into one state of all Bulgarian-speaking people. Rumania acquired from Bulgaria that portion of the Dobruja which had been Bulgarian since 1878, from Tutrakan on the Danube to Balchik on the Black Sea. The inhabitants of this region were thus deprived of their homes and their property, and it comprised the best of the real estate of the area.including the best cereal-growing land which had been held by the Bulgarians. Serbia and Greece divided Macedonia between them, with the exception of the mountainous region of the Perin and Despotovo Dagh. Bulgaria thus retained one outlet on the Aegean, in the shallow-water port of Dode Aghach; her so-called harbour at Porto Lagos consisted only of a short length of quay and a score of buildings. Turkey regained Adrianople and most of Thrace. The Balkan Wars of 1912 and 1913 thus resulted in an increase of territory for Serbia and Montenegro by five-fifths and for Bulgaria by one-fifth, while Greece almost doubled her territory. Serbia and Montenegro increased their respective populations by three-sevenths, Bulgaria by one-twentieth and Greece by two-thirds. The total casualties of the two wars were in inverse ratio to the gains of the three states concerned, viz.:—Bulgaria, 150,000; Serbia, 79,500, and Greece, 50,000. The terms of the Treaty of Bucharest—King Charles of Rumania himself said of it: “It is not a treaty, it is only a truce and it cannot last” were punitive rather than pacific in tendency, and the attempts of Russia, and possibly of Austria-Hungary also, to secure some modifications for Bulgaria were unsuccessful.

Radoslavov Government, 1913—On July 5 1913 the Radoslavov cabinet, at the critical moment when they assumed office, addressed a letter to the King, which was probably inspired by him, expressing their opinion that “the salvation of our State can only be found in a policy of intimate friendship with Austria-Hungary. That policy should be adopted at once and without hesitation, because every hour is fateful. We invite you to act immediately in order to save Bulgaria from further misfortunes and the King immediately gave his approval to the letter. A short time after, Radoslavov, N. Ghemandev and D. Tonchev. In the personnel of the cabinet the King found ready tools for the pursuance of his policy; several of the ministers, including Radoslavov and Ghemandev, had been prosecuted for corruption, embezzlement, and innumerable judicial proceedings, and Radoslavov himself had been condemned to a term of imprisonment and loss of civil rights. The decision of Dec. 9, 1913, against the minister of finance, Mr. Vasiavljev, was also an example of the policy of retrenchment which had been ceded to Bulgaria by Turkey by the Treaty of Bucharest. This measure was held by some to be unconstitutional, but the efforts of the government to conciliate the new Moslem voters and the Christian peasants who had been newly enfranchised by the Government majority of ten in the new Sobanye. The Turkish deputies, many of whom were members of the Committee of Union and Progress, thus held a casting vote in the Sobanye, and, through them, the Sublime Porte was able to exercise a direct influence on the Bulgarian Government. It became imperative to raise a force of 25,000 men, and on the seventh of July another loan of 150,000,000 was made, the interest of which was to be paid by the control of the state coal mines, of the projected railway which was to connect central Bulgaria with Porto Lagos, and of that terminal port itself. These terms were met with angry opposition throughout the country. The King of Rumania realized that Bulgaria was handing over her chief economic assets to Germany. The syndicate further sought to obtain the control of the export of tobacco, but, owing to strong expression of public opinion, the Government was obliged to refuse them. The King of Greece had already sanctioned this loan, but the loan was only obtained after violent protests from the Opposition, the uproar preventing the actual reading of the bill (June 1914). In high places, the standard of life among the peasants compared favourably as regards industry, morality and freedom from crime with that of any other European people.

Period of Neutrality (Aug. 1913—Oct. 15 1914).—At the outbreak of the World War in 1914 the great majority of Bulgarians wished to preserve neutrality; from force of circumstances, however, Bulgaria was already more than half way towards the Central Powers. The policy of the Radoslavov cabinet, the German loan, the establishment of friendly relations with Turkey, resentment against Russia for her non-intervention in Aug. 1913, together with the deep sense of humiliation and disappointment created by the Treaty of Bucharest, all combined to indicate the direction in which Bulgarian sympathy was likely to be drawn. Moreover, Macedonia, the fate of which had been the dominant factor in the policy of Bulgaria during the whole of her existence and the cause of her sacrifices in the two Balkan Wars, was now in the hands of Serbia and Greece. The Bulgarians naturally asked themselves which group of Powers would be able to help them to realize their national ideal and their material ambitions. It seemed to them unlikely that the Powers which were ranged on the side of Serbia would be willing to deprive their ally of the fruits of her victory in 1913 and to restore Macedonia to Bulgaria. The victory of the Entente might mean Russia at Constantinople, the union of Serbia and the Serb provinces in one important step towards the territorial loss of Macedonia. To the King, who held the direction of the policy of the country absolutely in his hands, the victory of the Entente meant the loss of his throne and the end of his dynasty. From an early date it was clear that Turkey would join the Central Powers, while the attitude of Rumania and Greece was uncertain. Owing to her geographical position Bulgaria would evidently be unable to preserve her “benevolent neutrality” for an indefinite time. Should she abandon it, it would be to join the winning side, and there were many in Bulgaria, including the King himself, who believed that Germany was invincible.
It is not yet known at what precise moment Ferdinand secretly promised his support to the Central Powers, but the Agrarian leader, Stamboliski, as early as Aug. 1914 accused the Government of having bound itself to the Central Powers, and there are certainly indications that the decision had been taken in the early part of 1915. The Opposition press at the outbreak of war appeared to be decidedly pro-Entente, though non-interventionist in tendency. Gueshov and Stamboliski constantly pressed for an agreement among the Balkan states themselves.

During the year in which Bulgaria maintained her neutrality, the rival groups of Powers made considerable efforts to secure her cooperation. It may be that Ferdinand had from an early date committed himself to a line of policy, but among Bulgars it is thought that, had the Entente encouraged the Opposition, who represented the great majority of the people, had the mentality of the people been better understood; had the Entente been definite in the proposals which from time to time were put before Bulgaria; had these proposals been made at propitious and not always at unpropitious moments; had the Entente been skilful and vigorous in its propaganda, it might well have been that the people would have imposed their will on the rulers whom they hated and despised. But the Entente policy pursued no certain course; the Entente Governments were slow to recognize the importance of Bulgarian cooperation; they were unwilling to pay the price which was asked for that cooperation; they did not realize the importance of the personal element in dealing with the Bulgars and with the King. The best propaganda for the Entente was, therefore, that which was promised for the cause of small nations and for the principle of nationality, since to the Bulgars this declaration meant protection for the Bulgarian state and reunion with the Bulgars of Macedonia and Thrace.

The most propitious moment to secure the support of Bulgaria would have been at the time of the Russian successes in the Carpathians in 1915, as the old feeling for Russia had never died out among the peasants. The chances of winning Bulgaria for the Entente lessened after the failure to pass the Dardanelles in March. German propaganda was skilfully handled; war news came chiefly through German sources; Tarnowski, the Austro-Hungarian minister in Sofia, either from personal or from foreign circumstances, apparently controlled the situation there. The Entente proposals were hedged about with conditions; at the end of May 1915, they offered the Enos-Midia line and the uncontested zone in Macedonia, provided that, at the end of the war, Bosnia and the Herzegovina had been united to Serbia. Early in June, Austria-Hungary promised Bulgaria, as the price of her neutrality, all Serbian Macedonia as well as the territory claimed by Bulgaria and now occupied by Rumania and Greece. On June 15 Bulgaria replied to the Entente note, asking for more specific guarantees. During July personal pressure was brought to bear at Sofia by special missions—a British mission composed of Mr. O’Beirne, Sir Valentine Chirol and Mr. G. Fitzmaurice; a French mission, and, on behalf of Germany, by Prince Hohenlohe—while active negotiations continued with Turkish delegates. On Aug. 3 the Entente answered the Bulgarian note of June 15; the Entente offered to Bulgaria, if she declared war on Turkey, the occupation of half the non-contested zone at once, the fate of the rest of this zone and of the contested zone to be decided at the peace; the immediate occupation of Seres and the promise of Kavalla, if Bulgaria would renounce all claims on Salonika, Kastoria and Vodena; and the promise of the Enos-Midia line. As these terms involved the retrocession of certain territories and places then occupied by Serbia and Greece, the allied representatives in Belgrade and Athens had the ungrateful task of trying to persuade Serbia and Greece to give up what they had won by force of arms, as the price of Bulgaria’s cooperation. Greece, inspired by Germany, refused absolutely to consider any cession of territory and Serbia, where the military party was at the time dominant, was equally intransigent.

On Aug. 10 Gen. Fichev, Minister of War, who was thought to have had further military adventures, resigned, and was succeeded by Gen. Jekov, who had lately been acting as negotiator with the Turks. The Opposition, becoming increasingly anxious, in vain demanded that the Sobranje should meet. On Aug. 23 Italy declared war on Austria-Hungary, and on Aug. 25 Venizelos returned to power. The moment had now come when the Central Powers desired the entry of Bulgaria into the war, and the Duke of Mecklenburg, who as special personal representative of the Kaiser and from his ability and personality was known to have a strong influence on the King, was sent from Germany to make the final arrangements. On Sept. 6 a military convention and treaty between Bulgaria and the Central Powers was signed at Pless. By this convention Germany and Austria-Hungary each agreed to send six infantry divisions within a space of 30 days, and Bulgaria four infantry divisions within 35 days, against the Serbs; F. M. von Mackensen was to be commander-in-chief of the combined force. Turkey was, if so desired, to send troops to Dede Aghach to prevent an enemy landing. Germany agreed to advance 260 million francs to Bulgaria for military expenses, and to provide as much military material as she could spare. On Sept. 10 the existence of the treaty was admitted by Radoslavov, who stated that Bulgaria was “coming in on the side of the victors.” On Sept. 12 the Opposition issued a manifesto, signed by many notable Bulgars, protesting against the policy of the Government and urging all citizens to unite to prevent the fatal step; the manifesto was, however, suppressed and the Opposition then demanded an audience of the King. On Sept. 13 the Entente made a final effort to induce Bulgaria to declare war on Turkey.ussen; among whom the King held the chief place, and that, if the King repeat the criminal act of plunging his country into war, the leaders would not check the revolt against him but would themselves head it. Tsanov, the Radical leader, spoke with equal emphasis and sincerity. An account of the audience was published, but its circulation was forbidden, and Stamboliski was condemned to imprisonment for life on a charge of lèse-majesté. On Sept. 22 the terms of the Turco-Bulgarian agreement were published; the Bulgarian frontier was to follow the Tunja valley as far as the suburbs of Adrianople, including the railway station, and then to follow the left bank of the Maritsa southwards at a distance of about 2 km., thus safeguarding Bulgarian railway communication between Sofia and Dede Aghach.

Mobilization was decreed on Sept. 22, the Greek army being mobilized immediately afterwards. On Oct. 4, Savinski, Russian minister at Sofia, informed the Bulgarian Government that he had been instructed to leave the country if, within 24 hours Bulgaria did not break with the enemies of the Slav cause and forthwith send away the military officers of hostile belligerent states. On Oct. 5 the Bulgarian Government replied that the mobilization was a measure of internal importance only, that the landing of Allied troops at Salonika did not tend to
reassure Bulgaria as to the friendly intentions of the Entente, and that it was impossible to send away the German officers, as, with the exception of officially accredited military attachés, there were no such officers serving with the Bulgarian army. It is still maintained by the Bulgars that no German officers arrived till after the departure of the Entente ministers. On the receipt of this note the ministers representing the Entente Powers asked for their passports and left Sofia for Dobroge Aghach. On Oct. 12 Bulgaria declared war on Serbia; on Oct. 15 Great Britain declared war on Bulgaria, while France and Italy declared war on her on Oct. 16 and Oct. 17 respectively.

The World War 1915-6.—The King's proclamation to his people showed the same duplicity as had marked all his diplomatic dealings with the Entente. After enlarging on his efforts to maintain neutrality, he said: 'Our Allies and the great powers of the Central Empires are in Serbia and are rapidly advancing.' Mobilization, as eye-witnesses have stated, was not effected with the willingness which marked the mobilization of 1912—there were even attempts at mutiny in some centres—though the presence in Sofia of the Macedonian divisions to whom Serbian acts of oppression in Macedonia were a burning personal wrong and not merely a pretext for war, served to stimulate public enthusiasm. When once the country was actually at war, the Opposition became silent, partly from force majeure and partly from patriotic motives; all Bulgars realized that the fate of their country was at stake. Malinov, to whom the King's ministers, declined to take the oath, worked in the Radoslavov Cabinet, and Stamboliiski, who was the only man in the country who could have led a revolution, was already in prison. Public meetings were forbidden and a strict censorship of the press established. The Bulgarian campaign in Serbia was, in spite of gallant opposition by the Serbs, completely successful. By the end of the year the Serbian army had retreated through Albania to the Adriatic and the Entente troops had retired within the Greek frontier, which the Bulgars did not then attempt to cross, although they themselves were confident that they could have taken Salonika. But on the one hand the attitude of Greece was still uncertain and on the other it was to the interest of Germany that Entente troops should remain at Salonika and thus reduce the numbers available for the western front. In June 1916 the Bulgarian army occupied Seres, Drama, and Kavalla. The Sobranye had met in Dec. 1915 but, in spite of the apparently complete success of the campaign, the Radoslavov Government narrowly escaped defeat in the budget debates in July 1916. Several of the Agrarian deputies who were deemed compromised by their earlier negotiations with an agent of the Entente were imprisoned, and the Government secured the return of their own supporters in their place. On Aug. 27, 1916 Rumania declared war on Austria-Hungary and, in spite of the efforts of Malinov and others to induce the Government to remain neutral, Bulgaria declared war on Rumania on Sept. 1. This war was, however, more popular than the campaign against Serbia, for the resentment caused by the action of Rumania in July 1913 was specially bitter. The Bulgarian troops were, nevertheless, unwilling to cross the Danube, as they considered that their work was finished when once the Dobruja was again in their possession; some mutinies even took place. Though the Bulgarian forces here were commanded by Gen. Tochev, F. M. von Mackensen actually directed the operations, and, almost immediately, friction developed between the allies, resulting in Tochev's suspension. The harvest of 1916 was not a good one; the whole population was rationed for meat, bread, sugar, rice, soap and salt, and considerable discontent arose when it was found that large quantities of produce, especially of wheat and eggs, were being sent to Germany. German officials took over the technical control of the railways, especially the Macedonian, Dobruja and Trans-Balkan lines, which were worked with great efficiency; the railway employees remained Bulgarian. The Germans did not otherwise interfere with the civil administration of the country, while, on the military side, they restricted their active intervention to the broader issues in the conduct of the campaign. In addition to the larger formations which Germany contributed to the Bulgarian fronts in accordance with the military convention, many German technical units reinforced the Bulgarian army and were allotted to the more important sectors of the front. The decorations of the two nations were exactly alike; wireless and railway construction units, and hospital staffs. These units were highly efficient, and, on the whole, the two personnel worked amicably together. In Nov., Monastir was taken by the allies.

1917.—In March news of the revolution in Russia roused once more the instinctive sympathy of the Bulgars for Russia. No stenographic reports of the debates in the Sobranye have been published, but it is known that the Opposition pressed their view that Bulgaria, having gained Macedonia and the Dobruja, should now enter the war. A war credit of 350 million levas was, however, voted in March. It was by no means certain that Bulgaria's allies would allow her to retain all her gains: neither Germany nor Austria-Hungary was willing that Bulgaria should remain in northern Dobruja, and Turkey opened negotiations for the return of that portion of the Maritsa valley which had been ceded to Bulgaria by the Turco-Bulgarian agreement of 1915. During the summer secret negotiations were carried on in Switzerland between agents of the Entente and Bulgarian agents, but though Ferdinand may have been aware of the negotiations, the Bulgarian representatives lacked the authority and personality necessary for bringing about a definite outcome. A conference of foreign ministers was held at Potsdam and attempted, by the bestowal of decorations, to restore cordial relations with Bulgaria, but it was a matter of common knowledge that the personal relations between the Kaiser and the King were anything but friendly.

1918.—The winter of 1917-8 brought a further shortage of supplies and increased discontent and suffering. The Bulgarian soldier had been accustomed to campaigns which, though they entailed severe fighting and hardships, had only lasted a short time; in the Serbo-Bulgarian War of 1885 fighting had lasted a fortnight; in the first Balkan War, some six months; and in the second Balkan War, a nominal 40 days. The Bulgarian women had as a matter of course replaced the men in all agricultural work, but the Bulgarian soldiers, most of them peasant proprietors, were anxious to be at home for the harvest, and their restlessness showed itself in an increased number of desertsions. Trench warfare was, moreover, peculiarly uncongenial to troops who were accustomed to open warfare. In Jan., Germany ceased to pay the annual subsidy of 50 million francs, which she had given Bulgaria since she entered the war, and after March she sent her no further supplies of munitions and equipment. The publication of President Wilson's Fourteen Points (Jan.) had great influence on feeling in Bulgaria. Relations had never been broken off with the United States, and attempts were made to induce the President to promise Macedonia to Bulgaria. Articles in praise of the United States were allowed to appear in the press, and the Bulgars, on their part, professed to be ready to desist from the offensive which was then projected, and to make a separate peace. In May, Rumania signed the Treaty of Bucharest, by which the Dobruja was ceded to the Central Powers in conditùmìn, Bulgaria regaining what Rumania had taken from her in 1913. In June the Radoslavov Cabinet, which had despaired and deserted throughout the country, fell and the King selected Malinov to form a new ministry. The change of Government did not mean a definite change of policy, and Malinov was reproached later for not insisting at once on a separate
BULGARIA

521

peace, as he fully realized that all was not going well. At home, the new Cabinet endeavoured to improve the food conditions and to put an end to the corruption and inefficiency in the public service which had prevailed under Radoslavov. After the Austro-Hungarian defeat in Albania in July, when it became necessary to extend the Bulgarian front still further, the Bulgars pressed Germany to send the help which from the days of the Treaty of Bucharest was promised. The Romanov, six German and Russian divisions guaranteed by the military convention, only three had actually materialized and when at last German troops, in response to further urgent appeals, began to arrive in Bulgaria, the Bulgarian line had already been broken, Serbs were at the frontier and Allied troops were actually invading Bulgaria. On Sept. 25 Malinov asked for an armistice and delegates left at once for Saloniki accompanied by the diplomatic representative of the United States. On Sept. 30 the Armistice was signed, the Bulgarians accepting the Allied terms unconditionally. Stamboliiski, who with other Agrarian deputies had been in prison since 1915, was released on Sept. 18 and went immediately to the front where there was great unrest among the troops. At one moment it seemed probable that a revolution would take place and a republic be proclaimed, and there was serious fighting outside Sofia in which many lives were lost, the German troops being employed to restore order. On Oct. 4 the King was informed by his ministers that he had better abdicate; that same night he left Sofia by train, having nominated his son Boris as his successor. His departure was received with absolute indifference by the people, there were no demonstrations either of regret or joy. Radoslavov fled the country immediately afterwards. On Nov. 28 Malinov resigned, as a protest against the installation of Rumanian officials in the southern Dobruja contrary to the terms of the Armistice. Todorov, who had been Guechev's second in command, succeeded in forming a coalition Cabinet.

Treaty of Neuilly.—On Nov. 27 1919 the Treaty of Peace between the Allied and Associated Powers and Bulgaria was signed at Neuilly-sur-Seine. Stamboliiski signing on behalf of his country. The territorial provisions (Arts. 27–33) included the cession to Rumania of the southern Dobruja, the cession of Serb of the Bulgarian towns of Tsaribrod and Strumitsa and the renunciation (Art. 48) "in favour of the Principal Allied and Associated Powers of all rights and title over the territories in Thrace which belonged to the Bulgarian Monarchy, and which being situated outside the new frontiers of Bulgaria . . . have not at present been assigned to any State." The Powers undertook "to ensure the economic outlets of Bulgaria to the Aegean Sea."

At the conference of San Remo in April 1920, a small portion of Eastern Thrace was assigned to Turkey and the remainder of Thrace to Greece. Bulgaria was not represented at the conference, though some 400,000 Bulgarians were concerned in the decisions as to Thrace; the Bulgarian delegate who had been sent from Sofia in the hope that the Allies would allow him to put the Bulgarian case before them was prevented by the French authorities from crossing the Italian frontier until the session had practically concluded.

The repatriation (Arts. 121–140) payable to the Allied Powers was fixed at two and a quarter milliards of francs (gold) or 560,000,000 sterling, to be paid in half-yearly instalments within 37 years; the cost of the armies of occupation and of various commissions was also to be borne by Bulgaria. The Repatriation Commission, which began work in March 1921, could at their discretion reduce or postpone particular payments and could assume full control and management of the taxes and sources of revenue.

The military clauses (Arts. 64–104) provided for the disarmament of Bulgaria. The total numbers armed with rifles, including military forces, gendarmerie, frontier and forest guards and police, were limited to a maximum of 33,000 men. The troops were to be recruited on a voluntary basis and to be exclusively employed for maintenance of order and frontier guard duties. All officers were to be regulars, serving for 20 consecutive years; other ranks were to serve for 12 years. Only one military training school and one State controlled munition factory were allowed. The manufacture of tanks, armoured cars, poison gas and aeroplanes, the export and import of arms, instruction in the use of arms in schools, clubs or organizations, arrangements for mobilization, new fortifications—were all prohibited. Only four torpedo boats and six motor boats were permitted, all without torpedoes and all manned by civilian crews. No artillery of calibre greater than 4·1 inches was authorized. All surplus war material had to be destroyed or surrendered within three months of the signing of peace.

Recruiting for the forces as constituted by the treaty proved very unsatisfactory, as but few Bulgars of a good stamp could be induced to leave their homes for a long period of service.

In Aug. 1919, elections were held which resulted in the following distribution of seats:—Agrarians, 86; Communists, 47; Social Democrats, 28; Nationalists, 19; Danesvists, 8; Radicals, 8; Radoslavists, 3. The Agrarians had been weakened by the secession of Draghiiev and his followers in 1915, and even with the support of Guechev and the Nationalists, were in a minority in the Sobranye. Stamboliiski became prime minister. In Feb. 1920, the Sobranye was dissolved; new elections gave the Agrarians a majority of two, and in April, Stamboliiski became premier of a Cabinet composed of his own supporters. In the course of the year 1920 Bulgaria was admitted into the League of Nations.

Finance and Trade.—The following table shows the effect of the wars on finance and trade:

The budget estimates for 1921–2—the financial year begins in April—thus showed a deficit of over £11,000,000. The consolidated and non-consolidated debts, including the war indemnity, amounted to £25,967,477, and for 1921–2 it was promised to the Allies that, though diminished, there would be sufficient resources, which, would, for the next few years, amount to 7 or 8 million pounds annually. The outlook, according to the Finance Minister, was not very satisfactory. The debt per head of the population was £210 (as against £56 in 1912), and taxation, in his opinion, reached the highest possible limit, viz. 500–540 levas per head. The townspeople had suffered much more than the peasants both during and after the war: according to the director of statistics, the national income of the country in 1913–14 was £29,412,000; while in 1920 it had fallen to £22,635,000. The industrial output and the taxes had fallen off, and when the post-war depression showed signs of a recovery, the rate of exchange of the lev as against the franc was again abnormal: 1 franc was worth 0·06 levas, whereas in 1913 it was 0·14 levas. Agricultural production, shown a steady increase of exports, but in 1919, withdrawals exceeded imports by £3,000,000; and in 1920, by about £3,000,000. In 1920, although Bulgaria comprised 25% more land fit for cultivation than in 1913, cultivation had decreased by 18% as compared with 1911, and her production of cereals was smaller than in 1911. On the other hand, owing to the greatly increased selling price of tobacco—it had risen from 1 to 2–50 francs per kilo before the World War to 36 francs per kilo in 1919—the area cultivated in tobacco was more than double in 1920 what it had been in 1911; also the 1920 potato crop was double what it was in 1911. The tariff of rose industry, which in Europe is in 1920 peculiar to Bulgaria, naturally suffered during the wars, and only 15,000 ac. are now under rose cultivation; it is estimated that, although the demand for rose essence is now increasing, several years must pass before the industry is fully reestablished and equipped with modern machinery.

Bulgaria's international trade had always been primarily with Austria-Hungary and Germany owing partly to the fact that the Danubian hitherto constituted her chief means of communication and partly to the fact that these countries made a more careful study of Bulgarian markets than seemed worth the while of more distant countries. For the first six months of 1920-1, imports, which had been £85,000,000 in 1913–14, were £35,000,000; and exports, which in 1913–14 had been £50,000,000, were £17,000,000; thus the treaty, Bulgaria's unfaavourable rate of exchange tended to direct her commerce yet more towards Central Europe.

It is estimated that, Better means of communication and capital are needed to develop the natural resources of the country—forests, mines and water power. Railway construction practically ceased with the outbreak of the first Balkan War in 1912, but the Trans-Balkan Trnovo-Stara Zagora line was completed since that date, 1.

1 All conversions are made at the pre-war rate of 25 levas to the £.
2 In 1915, 32–35 levas went to the £; in April 1921, about 345–350.
3 Excluding war expenditure.
4 Budget estimates.
and proved of great importance during the World War for the transportation (from the coalfields) of Russian Power.

In 1912, Bulgaria owned about 1,200 m. of normal gauge railway; in 1920 about 1,600 m., including some 250 m. of 2 ft. gauge which had been laid for military purposes.

The following are among the railways which have been undertaken:

1. Rakovska—Mastanli, part of the line planned in 1913 to connect central Bulgaria with Porto Lagos on the Aegean. Length, about 60 m.; gauge 30 in.
2. Boulevard—Smolnik, a 90-kilometre line through the pine forests of the Upper Myesta. Length, about 110 m.; gauge 30 in.
3. Mezdra—Vratsa—Vidin, begun in 1906 and now in operation as far as Mezdra.

Some 500 m. of line and some short lengths of railway for the exploitation of forests are also projected, but work is held up for lack of funds.

A law of 1921 sanctioned the construction of railways not exceeding 100 m. in length but lay down that special occupations would be offered in the hope of attracting private enterprise.

In 1912, Bulgaria owned some 9,000 m. of telegraph line, and some 2,700 m. of telephone line. There were four fixed radio telegraphic stations: Sofia (Telefankent 10,000 watts); Varna (Marconi's Shumen and Kyustendil). Kyustendil being not yet completed; according to the terms of the treaty, those stations may only be used for commercial purposes.

Social Conditions.—The programme of the Agrarian Government under the leadership of Stamboliski was framed primarily in the interests of the peasants in contradistinction to those of the bourgeoise. Some measures already in operation or of the nature of those in 1921 evoked much hostile criticism on the part of the Opposition, but though they involved some radical changes there seemed no probability of an outbreak of Bolshevism in Bulgaria. Stamboliski had himself foreseen that the constituting factor of King Boris' respect and affection of the people. The peasants were too much attached to their own homes and to their own way of life to desire great changes, provided they were spared further wars and were given peace and chance and the State.

The Bulgars have always put a high value on education, and statistics show a steady increase in the number of those able to read and write. In 1912, Bulgaria ranked first in this respect among Balkan peoples, having 33.7% of literates, and in 1919-20, only 17% of the children of school age had failed to attend school; but the type of education so far provided had led to thestocking of the schools with the educated and to the neglect of technical education. The educational programme of the Agrarian Government aimed at giving a more practical bent to instruction generally and at affording equal opportunities to all classes of the community. The total period of compulsory education was to be extended from four to seven years; a large number of additional primary schools had already been opened and many pro-gymnasia were to be established, as well as practical schools, where a training could be obtained in agriculture, industry and practical science. Great results, both material and moral, were expected from the law of May 1920 which imposed a period of forced labour on all members of the community. This law was especially severe on females, and compelled them to work six months on completion of their 20th year and six months for females on completion of their 16th year, the time being devoted half to theoretical training and half to manual labour on works of public utility. Bulgaria however, soon found that a million of men of the country might be effected by means of this compulsory service and, in deference to the Council of Ambassadors, the law had not been fully put in force in the spring of 1921. All classes of the community had been kept to work to the extent of 25% annually and the results of the reconstruction work undertaken—bridge building, road making, repairs to buildings, forestry, etc.—seem satisfactory. Much, of course, depends on the technical supervision provided and on the practical organization of the work. The children, numbering 660,000, and students devoted in March—April 1921 a week to manual labour—cleansing buildings and streets, preparing gardens, planting trees, etc.—were a great help.

Other legislative measures taken include up to May 1921 expropriation of Crown and Church lands as well as of private properties of over 300,000,000 crowns (say 75 ac.), the expropriated land being alienated to tenants; the raising of taxes for public purposes or for the accommodation of necessitous families; and proceedings by court-martial under Article 4 of the Law for Punishment of Criminals, against persons accused of being parties to the entry of Bulgaria in the First World War; the law for the abatement of laws during the war. The prosecutions resulted in long terms of imprisonment and heavy fines, and were naturally resented by those who were not conscious of the benefits which the bill for the participation of Bulgaria towards the Central Powers and by declaring war on Serbia in 1916 without the consent of the Saroya.

Bullard, Sir Roland (1861—1920), American soldier, was born at Youngsboro, Ala., Jan. 15 1861. He graduated from West Point in 1885 and was appointed first lieutenant in 1892. He served in various capacities in the Spanish-American War, and in the Philippines from 1902 to 1904. He was made lieutenant-colonel in 1907. In 1907 he was special investigator for the U.S. provisional government in Cuba, and the following year was superintendent of public instruction there. In 1911 he was promoted colonel, and in 1917 brigadier-general. He commanded the Second Brigade of the 1st Division of the A.E.F. in France in 1917 and was made major-general N.A. From the middle of Dec. 1917 to the middle of July following he commanded the 1st Division and from Oct. 1918 to the following July the Second Army. In Nov. 1918 he was appointed major-general in the regular army.

Bullen, A. H. (1857—1920), British man of letters, was born in London Feb. 9 1857 and educated at the City of London school and Balliol College, Oxford. He was the son of George Bullen, sometime keeper of the Printed Books at the British Museum. In earlier life he was a schoolmaster, but subsequently devoted himself to literary work. He became known as an authority on Elizabethan literature, and particularly for his discoveries of long-lost lyrics in the Bodleian and Christ Church libraries at Oxford, and his rediscovery of Campion in 1889 after nearly 300 years of neglect (see 5.138). For several years he was a partner in the publishing house of Lawrence & Bullen, and after its dissolution founded the Shakespeare Head press at Stratford-on-Avon in 1904, which he conducted until his death. He afterwards sold it to B. H. Blackwell of Oxford. He died at Stratford-on-Avon Feb. 20 1920.

Bullen, Frank Thomas (1857—1913), British novelist, was born in London April 5 1857 and was educated for a few years only at a dame school and Westbourne school, Paddington. When he was nine years old his school life came to an end, and he was employed as an errand boy for a time. In 1869 he went to sea, serving before the mast, and travelled to all parts of the world in various capacities including that of chief mate. In 1883 he gave up this seafaring life and became a clerk in the Meteorological Office until 1889. His reputation was made with the Idylls of the Sea (1896), and he also wrote, amongst other books, Idylls of the Sea (1896); Sea-Wrack (1903); The Call of the Deep (1905) and A Compleat Sea Cook (1912), besides many articles and essays. He died at Madeira March 1 1915.

Bülow, Bernhard Heinrich Karl Martin, Prince von (see 4.793).—Prince Bülow, after his resignation of the German chancellorship in 1909, lived principally at the villa in Rome which he had purchased with a view to his retirement.
Part of the summer he usually spent at Flottbeck near Hamburg or on the island of Norderney. A large fortune left him by a cousin, a Hamburg merchant, enabled him to live in elegant leisure and to make his house in Rome a centre of literary and political society. He employed his leisure in writing for the centenary celebrations of the Wars of Liberation, a remarkable book on Imperial Germany, extolling its achievements and defending the main lines of his own foreign policy (Engl. translation, M. Lavenz, 1914). In a revised edition (Engl. translation 1916) he omitted or altered many passages which seemed compromising in the light of the World War, e.g. his exposition of his policy of lulling Great Britain into a sense of security, while the great German navy was being constructed. He was understood to be in deep disfavour with William II., who never forgave him his attitude and action with regard to the Daily Telegraph interview in 1908.

On the outbreak of war Bülow found opportunity to identify himself publicly with the German cause, and, from his own point of view, he doubtless felt what, after Germany's collapse, was made a ground of bitter reproach to him, that no one had been more actively identified than he with the main lines of the German policy which led up to the war. He was once more to be employed in the service of his country, this time on a desperate enterprise. Italy, which has declared its neutrality at the outbreak of the war, did not eventually confine herself to the declaration that the casus foederis had not arisen for her as a member of the Triple Alliance. She had already intimated (July 5 1914) through diplomatic channels that she considered the action of Austria-Hungary against Serbia to be aggressive and provocative. On Dec. 9 1914 Baron Sonnino addressed a note to the Austro-Hungarian Minister for Foreign Affairs, Count Berchtold, calling attention to Art. VII. of the treaty by which Italy participated in the Triple Alliance, with particular reference to the words in that clause according to which the Austro-Hungarian Government was bound to the event of its disturbing the status quo in the Balkans even by a temporary occupation of Serbian territory, to come to an agreement with Italy and to arrange for compensations. By this note the questions of the Trentino and Trieste were formally opened. Austria-Hungary manifested great reluctance to enter upon the question of compensations, but Berlin was more alert and more anxiously concerned. Prince Bülow was, therefore, entrusted with the temporary charge of the German embassy in Rome, the actual ambassador, Herr von Flotow, going on sick-leave (Dec. 10 1914). He arrived in Rome with high expectations, and he began by expressing his entire sympathy on principle with the Italian demand for compensations. He had, however, to fight the intransigence of the Hungarian prime minister, Tisza, and Tisza's nominee, who was Berchtold's successor, Baron Burian. Bülow was from the first for the complete cession of the Trentino to Italy, but Austria-Hungary was willing to cede only part of it. Sonnino, for his part, pointed out that Italian feeling would not be satisfied even with the whole of the Trentino, but would also, in accordance with the irredentist programme, demand Trieste. Bülow continued to urge that all he could must be done to keep Trieste. Early in April 1915 Italy put forward in the course of the negotiations, which were secret, her demands for the Trentino, Trieste, the Cuzolari Is., off the Dalmatian coast, the recognition by Austria-Hungary of Italian sovereignty over Vallona, etc. The negotiations dragged on till the middle of May, when Bülow made a grave but characteristic tactical mistake. He is understood to have induced the Italian ex-premier Giolitti to come to Rome from Turin in the hope that Giolitti's following in the Chamber would be powerful enough to prevent a rupture and to bring about the acceptance of the Austro-Hungarian terms. An equally characteristic propaganda was believed to have been instituted by Bülow, in conjunction with the Austro-Hungarian ambassador Macchio, among the partisans of Giolitti behind the back of the Italian Government. The prime minister, Saldana, suddenly resigned. There was a great outburst of popular indignation, fanned by the impassioned eloquence of d'Annunzio and finding expression in demonstra-

See Mrs. Stuart Menzies, Modern Men of Mark (1920).
BURDETT, SIR HENRY (1837-1920), English economist and philanthropist, was born at Gilmorton, Leics., March 13 1847. He began life in a bank at Birmingham, but was elected in 1874 secretary to the Queen's hospital in that city. In 1880 he became secretary to the share and loan department of the Stock Exchange and also a member of the committee of management of the Seamen's Hospital Society. Finance and hospitals, especially in connection with nursing, were the two main interests of his life. He published Burdett's Official Intelligence of Securities, and also Burdett's Hospitals and Charities, as well as works on the National Debt, local taxation, The Hospitals and Asylums of the World (4 vols. with plates), and many other works on economic and hospital problems. It was largely due to him that King Edward VII. established his Hospital Fund for London. He also founded and edited The Hospital newspaper. He was created K.C.B. in 1897 and K.C.V.O. in 1908. He died in London April 29 1920.

BURLEON, ALBERT SIDNEY (1863— ), American lawyer and politician, was born at San Marcos, Tex., June 7 1863. He graduated from the university of Texas in 1884 and was admitted to the bar in 1885. For five years he was assistant city attorney in Austin, and from 1891 to 1895 was attorney of the 26th judicial district of Texas. From 1895 to 1913 he was a member of the United States Congress, serving as Speaker of the House of Representatives from 1901 to 1903. In President Wilson's Cabinet from 1913 to 1921. Soon after taking office in 1913 he aroused a storm of protest, especially on the part of the large daily newspapers, by declaring that he would enforce the law (requiring publications to print, among other things, a sworn statement of paid circulation), which had been held in abeyance by his predecessor until its constitutionality might be confirmed. The Supreme Court enjoined him from carrying out his purpose. During the World War he issued,

that the elastic structure of the Austro-Hungarian Monarchy, and the proved stability, in the case of Galicia, of a Polish province provided with wide powers of national self-government, made this appear relatively the best solution. He absolutely refused to consent to the far-reaching demands made by Germany in return for her acquiescence in this solution. In general, he maintained the view that in military, political and economic matters Austria-Hungary must be treated as an equal partner, and opposed a determined refusal to every German demand in which he saw danger to the independence, or a limitation of the territorial power, of Austria-Hungary. He thought, incidentally, that German policy was permeated with realism, and that Germany had a very high estimate of her own achievements, and of the rewards due to them, without feeling any obligation to measure the achievements of their ally by the same standard and give full satisfaction to her partner.

On the question of peace, too, there was a sharp antithesis between the views of Burian and those of German statesmen. With Burian, regard for the special interests of Austria-Hungary stood in the foreground. He refused to contemplate the loss of Austro-Hungarian territory in the south. On the other hand, he proposed as early as Nov. 1915 that Germany should smooth the way to peace by a public declaration of her willingness to guarantee the national independence of Belgium, and in the course of the year 1916 repeatedly urged that the way should be paved for negotiation with the enemy on the basis of the renouncing of conquests in the west. The decisive refusal of German statesmen to declare such a renunciation and to define precisely the demands and concessions to be made by the Quadruple Alliance in the peace proposals, as proposed by Burian, led to severe conflict between the two Cabinets. The peace note of Dec. 12 1916, which put an end to this quarrel, was the last important official act of Burian as Foreign Minister.

A few days later he laid down his office, but was recalled by the Emperor Charles after the resignation of his successor, Count Czernin, on April 14 1918. Burian now worked energetically for the conclusion of an agreed peace, and on that account came into conflict, as he had done two years before, with the German higher command. It was only in Aug. 1918, after the breakdown of the German offensive, that the German Government declared itself ready in principle to prepare the way for an agreed peace. But in the course of the negotiations insuperable differences appeared as to the time and the form of the peace offer. Bitter exasperation was aroused in the most influential German circles when Burian, holding to his design, ignored the German veto, and on Sept. 14 1918 addressed to all the belligerent nations an invitation to end the war by diplomatic negotiations. Burian's invitation had no success; it merely heightened the confidence in victory of the enemy Powers, who, by an offensive, definitely broke the resistance of their enemies, compelled them to accept a humiliating armistice, and forced them to prepare the way for negotiations which were intended to lead to the conclusion of separate treaties of peace. When the Vienna Government decided to follow this path Burian was no longer Foreign Minister. He had resigned in the midst of a confusion which gave reason to fear the approaching end of the state and the dynasty.

(A. F. P.)

BURLEON, ALBERT SIDNEY (1863— ), American lawyer and politician, was born at San Marcos, Tex., June 7 1863. He graduated from the university of Texas in 1884 and was admitted to the bar in 1885. For five years he was assistant city attorney in Austin, and from 1891 to 1895 was attorney of the 26th judicial district of Texas. From 1895 to 1913 he was a member of the United States Congress, serving as Speaker of the House of Representatives from 1901 to 1903. In President Wilson's Cabinet from 1913 to 1921. Soon after taking office in 1913 he aroused a storm of protest, especially on the part of the large daily newspapers, by declaring that he would enforce the law (requiring publications to print, among other things, a sworn statement of paid circulation), which had been held in abeyance by his predecessor until its constitutionality might be confirmed. The Supreme Court enjoined him from carrying out his purpose. During the World War he issued,
in 1915, an order barring unneutral envelopes and cards from the mails, and after America became a belligerent he instituted a censorship designed to suppress treasonable and scurrilous newspapers. The purpose was reasonable, but it was impossible to draw an ideal line and the result was a general alienation of the press. Later he introduced the "zone system," whereby postage on second-class mail was charged according to distance. In Aug. 1918 the telephone and telegraph systems were taken over temporarily by the Government and their control vested in the postmaster-general. He was an avowed advocate of permanent Government ownership of the telegraph and telephone, and in Dec. 1918 urged legislation to that end. In Nov. 1918, five days after the Armistice was signed, he took over the cables. He aroused the hostility of labour by his opposition to organization and strikes among postal employees. As early as 1913 he had urged repeal of the law allowing them to organize. He was interested in extending the parcel post, and worked for the promotion of airmail service.

BURNAND, SIR FRANCIS COWLEY (1836-1917), English humorist (see 4.248), died at Ramsgate April 21 1917.

BURNET, SIR JOHN JAMES (1839— ), Scottish architect, whose father was an architect in Glasgow, was born in that city in 1839, and was educated at the Western Academy, entering the École des Beaux-Arts, Paris, in 1854. He passed three years in the studio of Pascal, whose direction and guidance had a strong influence on his future design. After his return to Glasgow Burnet's first important commission was the Royal Institute of Fine Arts, the beginning of a series of important public buildings in various places in Scotland. Amongst these are the offices for the Clyde Navigation Trust, the Glasgow Athenaeum, the Pathological Institute—an extension of the Glasgow Infirmary—and the lay-out and building for the International Exhibition at Edinburgh, in 1886. He carried out also much ecclesiastical work, notably the Barony church at Glasgow and churches at Arbroath, Brechin, and Larbert. Amongst the larger business buildings designed by Burnet are the head office of the Union Bank of Scotland, and in London the important completion of the Selfridge premises, in collaboration with J. E. Graham, of Chicago. Entrusted with the addition of the new galleries at the back of the British Museum, a work which eventually took him upwards of nine years, Burnet, with a view of informing himself as to the conditions of museum design elsewhere, visited in 1893 various European galleries—Paris, Berlin, Vienna and others. In the following year he visited the United States, in order to obtain information for his designs for new laboratories for Glasgow University. He was knighted in 1914, and among his other honours were the LL.D. degree at Glasgow, and membership of the Institut de France, the Société Centrale des Architectes Français, and the American Institute of Architects.

BURNETT, FRANCES ELIZA HUDSON (1849— ), American writer (see 4.253), published in 1911 The Little Princess, a Play for Children and Grown-Up Children, in Three Acts. Her other later writings include My Robin (1912); T. Tembarom (1913); A Lady of Quality (1913); The Lost Prince (1913); The One I Know the Best of All (1915); The Little Hunchback Zia (1916); The Way to the House of Santa Claus (1916), and The White People (1917).

BURNHAM, EDWARD LEVY LAWSON, 1st Baron (1833—1916), English newspaper proprietor, was born in London Dec. 28 1833. His father, Joseph Moses Levy (d. 1888) who married Esther Cohen, was managing proprietor of a paper manufacturing and printing company and proprietor of the Sunday Times. Edward Levy, who took the added surname of Lawson in 1875 in accordance with the will of an uncle, Lionel Lawson, was educated at University College school, London. On leaving school he entered his father's business, and there received a thorough training in the printing and paper trades. In June 1855, immediately after the stamp duty on newspapers had been removed, the Daily Telegraph and Courier (see 19.559) was started by Colonel Sleigh. In September it was acquired by Mr. J. M. Levy, in liquidation of the debt due to him for paper and printing. Edward Levy, who was already dramatic critic of the Sunday Times, now became editor of the Daily Telegraph, and 30 years later its managing proprietor and sole director. It was not until 1903 that he relinquished this position to his eldest son. He took a leading place in English journalism, and was largely instrumental in getting the paper duty abolished in 1881. He was more than once president of the Institute of Journalists, and was active in his support of press charities, especially as trustee and treasurer to the Newspaper Press Fund. In 1909 he presided over the first Imperial Press conference, held in London; in 1930 his son similarly presided at the conference held in Canada. On Lord Burnham's 80th birthday in 1920, an address signed by the leading journalists of the British Empire, the United States and many European countries, expressing their sense of his great services to journalism. He was created a baronet in 1892 and was raised to the peerage as Baron Burnham in 1903. He married Harriette Georgiana (d. 1897), daughter of the actor Benjamin Webster (see 28.459). He died in London Jan. 9 1916.

His eldest son, HARRY LAWSON WEBSTER LAWSON, 1st Viscount Burnham (1862— ), was born in London Dec. 18 1862, and was educated at Eton and Balliol College, Oxford. He represented W. St. Albans (see 19.597) in the House of Commons from 1885 to 1892, E. Gloucestershire from 1892-95, and Tower Hamlets from 1905-6, and again from 1910-6. He was also a member of the London County Council from 1889-92 and from 1897 to 1904, as well as mayor of Stepney 1908-9. He succeeded to his father's barony in 1916, and was created a viscount in 1919. In his position as editor and managing proprietor of the Daily Telegraph he did valuable work during the World War. In 1917 he was included in the first gazette of the new Order of Companions of Honour. He was hon. colonel of the Royal Bucks Hussars. He married in 1884 Olive, daughter of Gen. Sir Henry de Bath, Bart., but had no son. The heir to the barony was, therefore, his brother, Col. William Arnold Webster Lawson (b. 1884).

BURNHAM, DANIEL HUDSON (1846-1912), American architect, was born at Henderson, N.Y., Sept. 4 1846. At the age of ten he moved to Chicago, and was educated there and at Waltham, Mass. He worked as an architect in various offices in Chicago, and in 1871 formed a partnership with John W. Root. To them was entrusted the planning of the Chicago World's Fair (1893). On the death of Root this work fell wholly upon Burnham, who in 1891 formed with C. B. Atwood a partnership known as D. H. Burnham & Co. In 1894 he was elected president of the American Institute of Architects. His success with the Chicago World's Fair buildings soon led to his being called upon to design structures in many cities. Of these may be mentioned "The Rookery," the Great Northern hotel, the Masonic Temple, and the Railway Exchange, in Chicago; the "Flatiron Building," and new Wanamaker's store, in New York; the Pennsylvania railway station in Pittsburgh; Filene's store in Boston; the Union station in Washington and Selfridge's in London. He also was asked to propose plans for improving several cities, including Cleveland (1903), San Francisco (1905, after the earthquake), Chicago (1909), and Baltimore. In 1905 he was asked by the U. S. Government to draw plans for cities in the Philippines, including Manila. He was made chairman of the national committee appointed for beautifying Washington, D.C. He died in Heidelberg, Germany, June 1 1912.

BURNS, JOHN (1858— ), English politician (see 4.853), held the office of President of the Local Government Board for more than eight years, during which he underwent comparatively little hostile criticism save from his old friends of the Labour party. While resisting a policy of doles, he was zealous in forwarding substantial measures of social reform; but he did not take a prominent part in the great party disputes over the budget. He was re-elected for the Parliament bill. His activity and success in the administration of his department were recognized—much against his own wish—by the raising of the President's salary in 1910 from £2,000 to £5,000 a year; but his policy was thought
to be too conservative even by some members of the Unionist party, and early in 1914 he was promoted to the Presidency of the Board of Trade. He held this office only six months, as in the following Aug. he could not bring himself to accept the necessity of war. He resigned without making any public statement of his reasons, and took no further active part in Parliament. At the general election of 1918 he desired to stand again for Bat-
tersen; but the local labour men required him, as a condition of their support, to become a member of the Labour party, sign its constitution, and accept its programme and whips. He refused to comply. "I do not believe," he wrote, "in political 
indentured labour. A war against militarism must not be 
contingent on the candidature of members of Parliament." Accordingly he withdrew his candidature, and continued in private life.

BURNS AND SCALDS (see 4.860).—During the World War a large number of burns were encountered in British medical practice, in the army and the navy and in munition works. The ordinary methods of treatment were adopted, but in addition the use of hot paraffin applications was tried with very marked success. This treatment indeed is stated by its supporters to give better results than any other hitherto employed. The burn is first dressed with wadding and lanoline, then covered with a analine such as flavine or proflavine. It is then covered, or an electric dryer. A layer of paraffin is applied at temperature 55°-60° C. A thin layer of wool is placed over the first layer of paraffin and then a second layer of hot paraffin painted over the wool. A dressing of wool and bandage is then applied and this is changed every 24 hours. The layer of paraffin must be of sufficient thickness. It may be sprayed on instead of painted. The temperature is thus important, for if it is too high the paraffin will run.
The use of the paraffin is largely to act as a protection, and it is claimed by some that the addition of antiseptics to the paraffin is very advantageous. Lieut.-Col. A. J. Hull of the R.A.M.C. emphasized this in a communication to the journal of the Corps and recommended that the antiseptic, brilliant green or flavine, should be employed. These antiseptics owe their wide use to the work of Professor C. H. Browning, who first introduced them.

The preparation of the paraffin is thus described by Colonel Hull:

"Take ½ gramme of brilliant green or 2 grammes of scarlet red or the equivalent of these grammes, and a light yellow or a light red, or a mixture of the two, and a light yellow, and add 210 grammes of paraffin 
and 50 c.c. of olive oil. Let the temperature of the resulting mixture sink to at least 65° C.; then stir in the previously prepared lanoline, paste, stirring until thoroughly mixed. At about 55° C. add 20 c.c. of eucalyptus oil; stir and allow to solidify."

The paraffin is said to form the least satisfactory suspension, but its therapeutic value has been continued to be used in its class. It acts as a stimulant to healing after the burns are clean. The flavine paraffin seems to answer best for recent burns.

BURROUGHGS, JOHN (1837-1921), American naturalist and writer (see 4.861), continued to instruct and entertain a wide public with frequent essays on out-of-door life, some of which were assembled in the following volumes: Time and 
Change (1912); The Summit of the Years (1913); The Breath of 
Life (1915); Under the Apple Trees (1916), and Field and Study 
(1910). Yale conferred upon him the degree of Litt.D. (1916), 
and Colgate the degree of L.H.D. (1911). He died on a train near Kingsville, O., March 20 1921, while returning from Califor-nia to his country home in New York state.

BURROWS, RONALD MONTAGU (1867-1920), English classical scholar, born at Rugby Aug. 16 1867 and educated at Charterhouse and Christ Church, Oxford. From 1891 to 1898 he was assistant to Mr. Gilbert Mur-ray, then professor of Greek at Glasgow, and from 1898 to 1908 he was professor of Greek at University College, Cardiff. In 1898 he was transferred to the corresponding chair at the Victoria University of Manchester. He conducted excavations at Pylus and Spathetria in 1895-6, and at Rhitsona in Boeotia in 1907. In 1913 he became principal of King's College, London, and held that post till his death in London May 14 1920. He published Recent Discoveries in Crete (1907) and various papers on archaeological subjects. All his life he was a fervent Philhellene. During the World War he was in active cooperation with the efforts of M. Venizelos to protect the 
interests of Greece and to secure Greek adherence to the Allies, and he took a leading part, by lectures and articles, in making the problems of the Near East familiar to the public.

BURT, THOMAS (1837- ), British labour politician, was born at Murton Row, near North Shields, Northumberland, Nov. 12 1837. He was a son of a cotton miller, and himself started working in the pits when ten years of age, his edu-
cation being scanty. In 1865 he was elected secretary of the Northumberland Miners' Mutual Provident Association, a post which he held until 1913, and in 1874 successfully contested Morpeth in the Labour interest, being thus (along with Alexander Macdonald) the first of the Labour members in the House of Commons. He took part in many industrial conferences, and in 1890 was one of the British representatives at the Berlin Labour congress of that year. In 1891 he was president of the trade union congress at Newcastle, and in 1892 entered the Liberal ministry as a Parliamentary Under Secretary of State for the Board of Trade, holding this post until 1895. In 1906 he was created a privy 
councillor, and in 1918 resigned his seat in Parliament.

See A. Watson, A Great Labour Leader (1908).

BUTCHER, SAMUEL HENRY (1850-1910), English classical 
scholar, was the eldest son of Samuel Butcher, classical tutor and lecturer at Trinity College, Dublin, and subsequently Bishop of Meath. Born in Dublin April 16 1850, he went to Marl-
borough in 1864, and won an open scholarship for classics 
at Trinity College, Cambridge, in 1866. In 1870 he won the Bell scholarship at Cambridge, in 1871 the Waddington scholarship, and in 1871 and 1872 the Powsen medal. In 1873 he graduated as senior classic and won a Chancellor's medal. He took an assistant 
mastership at Eton for a year, but returned to Trinity, Cambridge, as fellow and lecturer in classics. On his marriage in 1876 to Rose, daughter of Archbishop Trench of Dublin, he had to resign his Trinity fellowship, and was then elected tutor and "married fellow" at University College, Oxford. In 1882 he succeeded Professor Blackie as professor of Greek in the university of Edinburgh. During his tenure of this chair he became widely famous, both in Scotland and in the United States, for his administrative and educational reform. He was a member of the roya-
mmission which was appointed after the passing of the Scottish Universities bill in 1889 to reform the whole academic system in Scotland, and which reported in April 1900. In 1902 Mrs. Butcher died, and two years later he resigned his professorship and went to reside in London. He had been a member of the royal commission of 1901 on University Education in Ireland, which produced an abortive report with eight reservations in 1903; and he was also included on the royal commission of 1906. In the latter year, on the death of Sir Richard Jebb, he was chosen as a Unionist to represent the university of Cambridge 
or Parliament, where his brother J. G. Butcher (b. 1853; created a 
baronet in 1918), a well-known barrister, had sat for many 
years as Unionist member for York; he made an effective maiden 
speech on the Irish University bill and frequently took a valu-
able part in debate. His grave and thoughtful style and gift of 
natural eloquence were combined with a charm and sincerity
which won him universal respect and affection, no less in public
than in private life. He was however, above all, a fine Greek 
scholar, full of the true spirit of classical learning, with a remark-
able power of literary expression, shown especially in such publica-
tions as: Aspects of the Greek Genius (1880); Aristotle's 
Theory of Poetry and Fine Art (1865); Greek Idealism in 
the Common Things of Life (1901); Harvard Lectures on Greek 
Subjects (1904) and his prose translation (with Andrew Lang) of 
The Odyssey (1879). In 1907 he was president of the English Classical 
Association, of which he had been one of the principal founders 
in 1903. He was also the first president of the Irish Classical
Association, and an original member of the British Academy, becoming its president in 1909. In 1908 he was appointed a trustee of the British Museum. Two years later his health began to fail, and he died at his London home, 17 Oct. 1910, at the dinner given to celebrate the publication of the 11th edition of the E.B. by the Cambridge University Press. He died in London Dec. 2, 1910.

Butler, Henry Montagu (1833–1918), English educationalist (see 4.882), as master of Trinity, Cambridge, displayed to the full the scholastic and administrative gifts which had distinguished his period as headmaster of Harrow. His best-known work is a volume entitled Sermons Historical and Biographical (1890), but in 1914 he published Some Leisure Hours of Long Life, which contained excellent classical verse. He died at Cambridge Jan. 14, 1918.

See Edward Graham, The Harrow Life of H. M. Butler (1920).

Butler, Nicholas Murray (1862–1952), American educator (see 4.885), was elected a member of the American Academy of Arts and Letters in 1911. In 1912 he was chairman of the New York State Republican Convention and also a delegate to the Republican National Convention. Vice-President Sherman was renominated but died shortly before the general election, and the Republican electoral votes were cast for Dr. Butler for vice-president, who was overwhelmingly defeated on the ticket with President Taft. On the outbreak of the World War he supported the administration's peace policy as responding “to the best wishes and hopes of the whole people.” He criticised the formation of the National Security League on the ground that, in some cases at least, it had business interests back of it; and he disapproved of the organization of the American Legion. In 1916, however, he urged America's entrance into the war. The same year he was again a delegate to the Republican National Convention, serving as chairman of the Committee on Resolutions. He favoured woman suffrage and was an advocate of the short ballot. At the Republican National Convention in 1920 he received 69 votes for the presidential nomination on the first ballot, the number gradually falling to two on the tenth and last ballot. As an educator President Butler was a bold critic of many contemporary tendencies in American education. He upheld the old theory of mental discipline, and in the face of the wide-spread vocational movement in schools and colleges remained a steadfast and eloquent defender of liberal education. Under his guidance Columbia University became a cosmopolitan institution, its total registration in 1920 approximating 30,000 (see COLUMBIA UNIVERSITY). He was chairman of the National Committee of the United States for the Restoration of the university of Louvain, destroyed by the Germans in 1914. In 1920 he resigned the editorship of The Educational Review, becoming advisory editor. He was the author of Questions of American Freedom (1911); Why Should We Change Our Form of Government? (1912); Progress in Politics (1913); The Meaning of Education (1915), enlargement of the work published in 1898; A World in Peril (1917), interpretations of the war for a new world; Is The World Worth Saving? (1920); Scholarship and Service (1921).

Butler, Sir William Francis (1858–1910), English soldier and author (see 4.888), died in Tipperary June 7, 1910.

Butt, Clara (1873–1942), English contralto singer, was born at Southwick, Sussex, Feb. 1, 1873. She received her musical training at the Royal College of Music, and made her début in a students' performance of Gluck's Orfeo at the Lyceum theatre, London, in 1892. She possessed a contralto voice of exceptional power and wide range, and from the first became a public favourite as a ballad and oratorio singer. In 1899 she married the singer Kennerley Rumford (b. 1870), and with him sang constantly at concerts in all parts of Great Britain, also undertaking various long tours in the colonies. During the World War she devoted the proceeds of many of her concerts to war charities, and was in 1917 created D.B.E.

Buxton, Sydney Charles Buxton, 1st Viscount (1853–1952), British politician and administrator, was born in London Oct. 25, 1853, the grandson of Sir Thomas Fowell Buxton, 1st Bart. He was educated at Clifton and Trinity College, Cambridge, and afterwards entered public life, becoming a member of the London School Board in 1876. He was Lib. M.P. for Peterborough 1877, 1885, 1887, and for Poplar from 1886 till 1914. From 1892 to 1895 he was Under-Secretary for the Colonies. From 1905 to 1910 he was Postmaster-General, and from 1910 to 1914 President of the Board of Trade. In 1914 he was appointed High Commissioner and Governor-General of South Africa, being raised to the peerage as Viscount Buxton. He retired from this office in 1920.

Lord Buxton published Handbook to Political Questions (1880); Finance and Politics; An Historical Study (1783–1855) (1885); History of the British Death Duties (with G. S. Barnes, 1890); Political Manual (4th ed. 1891); Mr. Gladstone as Chancellor of the Exchequer (1901); The Fiscal Question (1904).

Byng, Julian Hedworth George Byng, 1st Baron (1852–1921), British general, was born Sept. 11, 1852, son of the 2nd Earl of Strafford, and joined the 10th Hussars in India in 1873. He saw his first active service on the Red Sea littoral a year later, when his regiment disembarked there on the Residency at Aden. He remained in India until 1880, when he was appointed to the Staff College, and was a major when the South African War broke out. He was then posted to special service to the Cape. He raised and commanded the South African Light Horse, which formed part of the Natal army and was at the relief of Ladysmith. Subsequently he commanded a column with marked success and was rewarded with promotion to the ranks of brevet lieutenant-colonel and colonel. After the war he commanded his regiment for two years, was then for a year in charge of the cavalry school, and was at the head of a cavalry brigade from 1907–9, when he was promoted major-general. He spent two years in charge of a Territorial division and then, in 1912, he was sent to Egypt to take command of the army of occupation.

In Oct. 1914 he was summoned home to take the 3rd Cavalry Div. to France, and he succeeded to the command of the Cavalry Corps in June 1915. But two months later he was despatched to the Dardanelles to take charge of the IX. Army Corps there and he became responsible for the Suvla area, from which he withdrew his troops most skilfully in the following December. For this valuable service he received the K.C.M.G., his corps proceeding to Egypt; but he was almost immediately called back to the western front to take over the XVIII. Army Corps, and in May 1916 he was transferred from this to the Canadian Army Corps, then formed, which he commanded for a year. The Dominion troops under his orders distinguished themselves on several occasions, especially in their capture of Vimy Ridge on April 9, 1917. He had been promoted lieutenant-general for distinguished service in 1916 and was given the K.C.B.

In June 1917 he succeeded to the leadership of the III. Army, which he retained till the close of hostilities. Towards the end of Nov. he carried out the brilliantly successful surprise attack on the Cambrai front for which he was promoted full general, though the German counterstroke in Dec. largely regained the lost ground. Determining on this front in the winter of 1917–8, his forces were on the left of the V. Army in the battles of March 1918 and were to some extent involved in its defeat, but they remained unbroken and eventually it was on their front that the enemy’s attack first came to a definite standstill. Five months later they bore their full share in breaking the Hindenburg line and in the general advance. For his services Byng was raised to the peerage as Baron Byng of Vimy and Stoke-le-Thorpe, and he received a grant of £30,000. He retired from the army in 1919, and in June 1921 was appointed to succeed the Duke of Devonshire as governor-general of Canada.

Bywater, Ingram (1848–1914), English classical scholar (see 4.906), died in London Dec. 17, 1914. He was a great collector of books, especially early printed Greek books, and he left a bequest to provide for the study of Byzantine Greek at Oxford.

See W. W. Jackson, Memoir of Ingram Bywater (1919).
CABLE, SUBMARINE TELEGRAPH: see SUBMARINE CABLE TELEGRAPHY.

CADBURY, GEORGE (1839– ), British manufacturer and philanthropist, was born Sept. 10 1839, at Elgbaston, Birmingham, the son of Quaker parents, and was brought up a member of that Society. In 1867 when he succeeded to the cocoa business known later as Cadbury Brothers Ltd., it gave employment to 12 workers only, but under the management of himself and his brother Richard it developed rapidly, and in 1879 he founded for the employees the garden village of Bourneville, which served as a model for other social ventures of the kind.

In 1910 when Cadbury Brothers Ltd. amalgamated with the firm J. S. Fry & Son of Bristol, they employed in all 4,000 people. Mr. Cadbury became chief proprietor of the Daily News in 1901, and his family also acquired an interest in the Star in 1909. The connexion of the Cadburys and other Quaker families with these Liberal and Free Trade organs caused them to be dubbed by opponents the "cocoa press."

His second wife, Elizabeth Cadbury (m. 1888), associated herself with her husband's philanthropic undertakings at Bourneville and elsewhere, besides holding many responsible positions on her own account. She was president of the N.U.W.W. and also of the midland division of the W.V.C.A., and was the author of several papers on housing and other social questions. She was made O.B.E. in Jan. 1918.

CADOGAN, GEORGE HENRY CADOGAN, 5th Earl (1840–1915), British politician (see 4.032), died in London March 6 1915.

CADORNA, COUNT LUIGI (1850–1917), Italian general, chief of the Italian staff from July 1914 to Nov. 1917, commander-in-chief of the Italian armies in the field from May 1915 to Nov. 1917, and senator, was born at Pallanza, on Lago Maggiore, Sept. 4 1850. His father was Count Raffaele Cadorna, a distinguished soldier of the wars of the Risorgimento and the Crimea; and his uncle, Count Carlo Cadorna, was one of the outstanding political figures of the same period. Luigi Cadorna entered the army in 1866, and served in the infantry, in the artillery and on the staff, becoming colonel in 1892. His career followed the usual course and his reputation steadily increased.

Lieutenant-general in 1905, he was appointed to command the Genoa army corps in 1910, and a year later he was chosen as an army commander in the event of war. He commanded one side in the manoeuvres of 1911, his opponent being Canova. The victory was adjudged to Canova, and though military opinion was divided upon the verdict it is probable that the result of the manoeuvres led to the preference being given to Canova for the command of the Tripoli expedition. But on the death of Gen. Pollio, chief of the general staff, there was little or no question as to his successor, and on July 10 1914 Cadorna received the appointment. He found the army in a deplorable condition, both as to personnel and as to material. And within three weeks the outbreak of general war forced the problems of army reform, consistently shirked by successive Cabinets, to the front. One of Cadorna's first acts on becoming chief-of-staff was to adopt the Déport field-gun, though the artillery had already begun to rearm with a Krupp quick-firer, and this prompt decision, which did not pass without criticism, was of the greatest value to Italy. Much was accomplished during the neutrality period, and though all efforts were handicapped by lack of money and by Italy's low industrial capacity, still, in the interval between Aug. 1914 and Italy's entry into the war, Cadorna fashioned a weapon with which it was possible to strike, and strike hard.

For 29 months Cadorna, handicapped always by lack of means, directed the operations against Austria-Hungary with insight, vigour and determination. Facile critics have found fault with his plan of campaign, but the more carefully and objectively Cadorna's plan is studied, the more it justifies itself against alternative policies. For a year Cadorna had the full confidence of his country, and his name, indeed, began to take on a legendary colour. The first check came with the initial success of the Austrian offensive in May 1916, though he had already incurred many enemies by the ruthless dismissal of those who appeared unequal to the duties of command—a process which in a great measure attained the desired end, though the dismissals were probably too numerous and certainly cost the army some good officers, besides handicapping others by the fear of supersession. As time went on, and signs of weariness became visible among some of the troops, Cadorna entered the strongest protest against the policy of the Government, which, he said, permitted an anti-war propaganda which lowered the moral of the army. Cadorna's protests were largely justified. Too little was done to meet anti-war propaganda, and the soldier who went on leave often returned to the front embittered by having found his family in want, while others who had escaped military service were not only safe but were making money. On the other hand, it must be admitted that a part of the responsibility for declining moral lay at Cadorna's own door. For he did not seem to have realized fully the strain of modern war upon the troops, or understood the necessity of lightening that strain by every possible expedient. The disaster of Caporetto, a disaster due to a complex of causes, led to Cadorna being transferred from the command of the Italian armies to the newly formed Allied military council at Versailles. But before he left his command he had organized the resistance on the Piave-Monte Grappa front.

Cadorna came to Versailles under the shadow of defeat, but his personality and military insight speedily impressed his colleagues and removed the initial handicap. It was a misfortune for Italy when, in Feb. 1918, consequent upon the appointment of the Caporetto inquiry commission, it was thought necessary to remove him from Versailles. As a result of the inquiry he was placed on half-pay on Aug. 29 1918, and four days later his definite retirement was gazetted.

In March 1921 Cadorna published a book dealing with his tenure of the post of chief-of-staff (La Guerra alla Fronte Italiana), which effectively answered much of the criticism that had been directed against his leadership. But with the passage of time this criticism had already begun to lose force. It was no longer necessary to find a scapegoat. More and more it was seen that Cadorna had made the Italian army fit for war, and that he had conducted the campaign under grave handicaps. Perhaps the most serious defect in Cadorna's leadership was that he failed to secure the loyal cooperation of many of his subordinates. The fact that he was not always well served was to some extent due to his methods. A certain friction also characterized Cadorna's relations with two successive Governments—on his side soldierly impatience with political methods and exigencies, and on theirs resentment at his criticisms of policy. Moreover, his belief in the necessity and duty of sacrifice made him slow to realize the limits of ordinary human endurance. But his achievement was great, and he remains, in spite of the disaster that closed his career, the foremost Italian military figure of the war.

CAILLAUX, JOSEPH-MARIE-AUGUSTE (1863– ), French politician and financier, was born March 30 1863. After studying law and following lectures at the École des Sciences Politiques he entered the civil service in 1888 as an inspector of finance, and spent most of his official career in Algiers. Standing as a Republican candidate in the elections of 1898 for the department of the Sarthe, in opposition to the Duc de la Rochefoucauld-Bisaccia, he was elected to the Chamber of Deputies by 12,020 votes to 11,737. He became Minister of Finance in the Waldeck-Rousseau Cabinet, and after its fall it was not until the Clemenceau Ministry of 1906 that he returned to office again, once more with the portfolio of Finance. In 1911 he became prime minister. Unfortunately it was his ambition to bring France and Germany
CAILLETET—CALIFORNIA

529

together on the common ground of finance, and he failed. He
endeavoured, while he was prime minister, to meet the arrogant
demands of Germany in Morocco, in the course of protracted
and secret negotiations carried out mainly through Baron von
Lancken, who was then Chancellor of the German embassy in Paris.
These negotiations became known, notably in the
Clemenceau papers, and they directly led to the dispatch by Germany to Agadir of the
gunboat "Panther" in 1911. The convention which put an end
to the ensuing crisis involved the surrender by France of large
tracts of the French Congo to Germany. The whole negotiations
formed the subject of an inquiry by a special committee of the
Senate, whose report was very unfavourable to Caillaux. Never-
thess, thanks to his undoubted qualities as a financier, he
remained a great power in French politics. He fought the Three
Years' Service bill with the utmost tenacity; and although that
bill became law, it was he who finally, on the financial
aspect of that bill, brought about the downfall of the Baruth
Ministry in the autumn of 1913. His past history was of a
character which made it impossible, if the Entente Cordiale was to
continue, that he should return to the position of prime min-
ister, but he joined the new Cabinet as Minister of Finance. As
a financial expert he had for long identified himself with a great
and necessary reform in the fiscal policy of France—the intro-
duction of the principle of an income tax. For this principle he strove
—in public, at any rate—throughout the winter of 1913. His advo-
cacy of an income tax and his uncertain and erratic championship
of peoples' ideas, alarmed all the conservative element in the
country, and throughout the winter he was attacked with increas-
ing violence from the platform and through the press. Those
attacks reached their highest point of bitterness in a series of dis-
closures in the Figaro, of a more or less personal nature. This
newspaper started the publication of letters addressed by him to
the second Mme. Caillaux while he was still married to the first.
A tragic end was made to the Figaro's campaign when the second
Mme. Caillaux called upon the editor, M. Gaston Calmette, and
fired five shots at him on March 16, mortally wounding him.
Caillaux was arrested and, after long delay, tried on a charge of high treason
which took place shortly afterwards resulted in a crisis of unusual
bitterness, which was solved eventually by Viviani becoming
prime minister. The trial of Mme. Caillaux for murder began
on July 20 1914 and ended by her acquittal on the very eve of war.
During the first part of the World War, Caillaux, who was by
no means a popular figure, filled the duties of an army paymaster.
After one or two scenes in Paris he was sent on a mission to South
America. He returned in 1915, and at once attracted every
effort of the German secret service. Although taking no overt
part in politics he carried on a lobby campaign; he financed
necessary agricultural associations (formerly the National
Conservative Agricultural League) to consolidate his position. He became acquainted with
the Bolos and the Malvys of political and journalistic life, and
his activities aroused the alarm of all French patriots. By the
spring of 1917 he had become in the eyes of the public "l'homme
de la défaite"—i.e. the man who was willing to effect a compro-
mise peace with Germany at the expense of Great Britain. The
long political intrigue (see France: History) which led to
the advent of Clemenceau to power killed all his hopes. Caillaux
was arrested, and, after long delay, tried on a charge of high treason
by the High Court of the Senate, and sentenced to three
years imprisonment, the term he had already served, and to the
prohibition of residence in French territory for five years and depriva-
tion of civil rights for ten years.

CAILLETET, LOUIS PAUL (1832-1913), French chemist,
was born at Châtillon-sur-Seine Sept. 21 1832. He was a pioneer
in experimental work with the liquefaction of gases (see 16,745
and 757). He died in Paris Jan. 4 1913.

CAINE, SIR THOMAS HENRY HALL (1853- ), English
novelist (see 4,949), was created K.B.E. in 1918, in recognition of
his war services, especially in propaganda work. In 1914-5
he edited King Albert's Book, a co-operative contribution in
humanitarian literature; he also wrote a play The Iron Hand;
another play, The Prime Minister, was produced at the Royalty
theatre, London, in 1918.
The principal industries in 1914 were canning and preserving, $61,162,849; petroleum refining, $55,527,651; lumber and timber products, $23,860,272; slaughtering and meat packing, $50,011,820; milling and publishing, $3,474,879; foundry and machine-shop products, $31,732,384; lumber and hard and soft woods; and bread and other bakery products, $21,855,181; butter, cheese, and condensed milk, $20,466,428; cars and general shop construction, and repairs by steam-boat companies, $31,877; and their total beet sugar, $15,528,666. California ranked ninth state in the total value of manufactured products; first in the canning industry; and in the production of crude petroleum; second in petroleum refining, exceeded only by New Jersey in production.

Communications.—In June 1910 the total railway mileage was 7,535 m. of main track. The total mileage, Jan. 1, 1919, was 8,268, with 1,168,500 m. of 100-sd. track. In 1919 they carried at $6,593,581.

The following table shows comparative acreage, production and value of the chief crops for 1909 and 1919:

Cotton during the decade showed a remarkable increase in production and obtained the rank of a staple crop. The production of rice pastured beyond the experimental stage. In 1880, farms were produced 6,263,313 bus., valued at $20,942,627. The production of sugar beets, 843,289 tons, valued at $3,116,981 in 1900, fell to 666,869 tons in 1910, valued at $3,079,169. The production of rye in 1909 was 1,020,000, valued at $79,000,000. The most important crops were peaches (290,242,157), peaches and prunes (285,713,764), apples ($22,817,158) and apricots ($115,150,199). The production of oranges in 1910 was 21,759 boxes, valued at $67,048,178. Among the more recent commercial fruits are alligator pears (avocados), of which 7,919 crates were produced in 1919, valued at $63,352.

Minerals.—The total value of mineral products for 1910 was $86,688,347. California was the second state in gold production with 988,853 fine oz., valued at $20,141,400. Gold production for 1919 was $241,588 fine oz., valued at $17,398,201; silver, 1,165,673 fine oz., valued at $1,291,053. Copper production fell to 22,215,650 lb., valued at $2,426,934, as compared with 22,767,469 lb. in 1918, valued at $17,775,641. Lead production fell in 1910 to 4,475,461 lb., valued at $3,515,947, as compared with 12,329,049 lb. in 1919, valued at $306,879; quicksilver to 14,941,385, as compared with 22,651 in 1918. The ioil output for 1918 was 75,221,977 barrels.

Manufactures.—The following preliminary figures show the growth in manufactures between 1914 and 1919:

of improper influence in state legislation. His remarkable success in carrying through a comprehensive programme of legislation is shown by the passage of the measures referred to. When, following the break in the Republican party in 1912, the National Progressive party was organized, Johnson was nominated for vice-president on the ticket with Theodore Roosevelt. In the succeeding election the results were extraordinarily close and long in doubt; Roosevelt secured a plurality of 174 over Woodrow Wilson, the Democratic candidate, the popular vote being 283,670 for Roosevelt and 283,436 for Wilson. In 1916 the popular presidential vote was almost equally close but reversed, 466,289 for Wilson and 462,516 for Hughes, the former receiving a plurality of 3,773. At the election in 1918, Johnson again held the vice-presidential position in the first time. In 1920 the popular vote for president was 624,902 for Harding and 229,191 for Cox. In 1916 Gov. Johnson was elected to the U.S. Senate, taking his seat on March 4 following. Beginning Oct. 9, 1911 attention was centred in the trial in Los Angeles of John J. and James B. McNamara, accused of dynamiting the Los Angeles Times building (Oct. 9, 1910), resulting in the death of 21 persons. The crime was one of a nation-wide series intended to prevent the use of non-union materials and non-union labour. The defendants were strongly supported by the American Federation of Labour. Early in the trial the grand jury found them both guilty, and James B. McNamara was sentenced to life imprisonment and John J. McNamara to imprisonment for 15 years.

In 1913 the anti-Japanese feeling throughout the state culminated in the passage of the Webb Alien Land-Holding Act. In 1909 measures had been proposed in the Legislature aimed at preventing the ownership of land by Japanese, but at the request of President Roosevelt these were dropped. Similar measures were introduced in 1913, and on April 13 a measure to that effect passed the Assembly, containing language dis-pleaseing to the Japanese Government. President Wilson at once communicated with Gov. Johnson, urging delay, and with the approval of the Legislature and of the governor, Secretary of State Bryan went to California to counsel moderation or delay in action. But another bill drawn up by Attorney-General Webb for the same purpose passed both Houses of the Legislature on May 3, 1913, and was signed by the governor May 10, to be effective Aug. 17. The first two sections of the Webb bill were as follows: (1) "All aliens eligible to citizenship under the laws of the United States may acquire, possess, enjoy, transfer, and inherit real property, or any interest therein, in this state in the same manner and to the same extent as citizens of the United States, except as otherwise provided by the laws of this state. (2) All aliens other than those mentioned in section 1 may acquire, possess, enjoy, and transfer real property, or any interest therein, in the manner and to the extent and for the purpose prescribed by any treaty now existing between the Government of the United States and the nation or country of which such alien is a citizen or subject, and not otherwise." While this bill prevented the Japanese from acquiring land in the state, its supporters held that no treaty rights were infringed, and that Japan could not justly take offense at the language used.

For several years San Francisco had been trying to secure power of the Panama Canal. In 1910 they got a contract for furnishing water to the city. In 1913 a bill passed Congress, granting this. The question evoked much public discussion on both sides. Gifford Pinchot, the well-known conservationist, supported the project, while the naturalist, John Muir, strongly opposed it. The Panama-Pacific International Exposition, celebrating the opening of the Panama Canal, was held Feb.-Dec. 1915, at San Francisco. At the same time an exposition was held in San Diego, devoted chiefly to the display of California products. The state supplied to the army during the World War 12,514 men (excluding officers). The subscriptions to the four Liberty Loans in order were $100,100,000, $75,000,000, $74,926,206, $79,126,700; to the Victory Loan, $86,792,050.

Recent governors were James N. Gillett (Rep.), 1907-11; Hiram W. Johnson (Progressive Rep.), 1911-7; William D. Stephens (Rep.), 1917-.
with a revolver. The unfortunate journalist was well known for his interest in art, and possessed a fine collection of caricatures and engravings of the First Empire.

CAMBON, PAUL PIERRE (1843– ), French diplomatist (see 5.82), was appointed French ambassador in London in 1898. His career at the London embassy was brilliant in the extreme. He was one of the leading artisans of the Entente Cordiale, and played a very important part in frustrating the efforts made by Germany to separate France and Great Britain in 1914 on the eve of the World War and in maintaining good Franco-British relations during the peace negotiations. He resigned his post in Nov. 1920.

His brother, JULES MARTIN CAMBON (1845– ), had become French ambassador at Berlin in 1907, and was there when the World War opened. He reached France from his post in Berlin after a journey in the course of which he was subjected by the Germans to many indignities. He had been a close observer of Germany’s year-long preparations for war. He became General Secretary of the Foreign Office during M. Briand’s war term of office, a post which he occupied with distinction. He was also elected a member of the French Academy.

CAMBRAI BATTLE OF (1917): see ARTOIS, BATTLES IN; also TANKS.

CAMBRAI-QUENTIN, BATTLE OF (Aug. 26-Oct. 5 1918).—The first stage of the British offensive in Aug. 1918, the battle of Amiens, had been successfully accomplished, and the second stage, the battle of Bapaume-Péronne, was making good progress (see SOMME, BATTLES OF THE) when it was considered by British G.H.Q. that on Aug. 25 to use the words of Lord Haig “the proper moment had come for the third stage of the operations, in which the First Army should invite the flank of our attack to the north.” By driving eastward from Arras, covered on the left by the rivers Scarpe and Sambre, the First Army would endeavour to turn the enemy’s positions on the Somme battlefield and cut his system of railway communications which ran south-westward across their front.” See map, Plate I.

1. Operations of the First Army (Aug. 26-Sept. 20).—The forces at the disposal of Gen. Horne’s First Army for these operations consisted of the I and VIII Corps, to which the Canadian Corps was now added. This last-named formation began to arrive in the army area on Aug. 22, and was put into line on the right or southern wing of the army. Thus the front on Aug. 25, the eve of the offensive, was held as follows, from right to left: German (Currie) (2nd Canadian, 3rd Canadian and 51st Div. in line, 1st Canadian Div. in reserve); VIII Corps (Hunter-Weston) (8th and 20th Div. in line, 34th Div. in reserve); and I Corps (Holland) (55th and 16th Div. in line, 15th Div. in reserve). Of these forces, however, only those astride the Scarpe, i.e. the Canadian Corps, were to be engaged, the main axis of the attack being the line of the Arras-Cambrai road; the two remaining corps were to stand fast, while making all endeavours to deceive the enemy and prevent him dispatching reinforcements to other threatened points. The VIII. and I Corps therefore will not come again into this narrative.

Facing the right of the First Army were the German I. Bavarian Reserve Corps astride the Scarpe and the II. Bavarian Corps as far south as the Arras-Cambrai railway. These two corps formed the right of the Seventeenth Army and had divisions in line. They held the old German trenches of 1916 from W. of Gavrelle in the N., by Fampoux, F echuy, and Tilloy to Neuvile Vitasse in the south. Behind them lay a succession of strongly fortified zones—first, the old British and German defences of 1917 covering all the ground W. of the Coieil river; next the Frénaux-Rouvy线路 and the Vis en Artois switches and finally the Drocourt-Quentan line. To the E. of this, the last artificial position, there lay the strong natural defence line of the Canal du Nord covering Cambrai. The task upon which the First Army was about to embark was thus no easy one.

The Canadian attack was timed for 3 A.M. on Aug. 26—that is, well before dawn. Some 45 tanks were available, and owing to the absence of some of the corps artillery only 600 guns covered the advance. Two objectives were assigned, the first running E. of Fampoux and W. of Monchy and Wancourt, the second including Roeux, Monchy and Guémappe, while exploitation was to be carried out beyond this latter line as far as possible.

The operation was carried out exactly as ordered. The Germans opposite the Canadians appear to have been warned of the attack and to have thinned out their front line, so that resistance was weak at first. Heavy fighting, however, took place for the second objective, particularly in the southern sector, where the 2nd Canadian Div. was operating; here the ridge E. of Wancourt and Guémappe was not finally secured till late at night. The 3rd Canadian Div. had pushed its troops beyond Monchy and up to the edge of Pelves by midday, while N. of the Scarpe the 51st Div., advancing at 9 A.M., occupied Fampoux and Gavrelle with little opposition. The Germans delivered counter-attacks S. of the river without success and at the end of the day the Canadians had penetrated into and maintained themselves within the enemy defences some two and a half miles to the E. of their starting points.

The operations were continued during the following two days by the same divisions in line. The 3rd Canadian Div., moving off at 4.45 A.M. on the 27th, met with steadily increasing hostile resistance, chiefly on the left in the Scarpe valley; the 2nd Canadian Div. commenced its advance only at 10 A.M. Both made progress, and by the evening had reached the line of the Senseé, between Cherisy and Rémy. The Canadians now found themselves in front of the Frénaux-Rouvy line, which in this sector ran from N. of Hendecourt by Rémy and Boiry to Biache, and the capture of this line was assigned as the objective for the 28th. The divisions again advanced at different hours, the 3rd at 9 A.M., the 2nd at 12.30 P.M., and the brigades and battalions also attacked in succession from the left, thus enabling all the artillery available to unite in covering the advance of each unit in turn. This method proved highly successful on the left, where by the end of the day the 3rd Div. was in possession of the Frénaux-Rouvy line along its entire front; the 2nd Div., however, despite valiant efforts, was unable to make much progress.

That night the divisions in line were relieved, the 1st Canadian Div. coming in on the right, the 4th British Div. on the left. The next few days were devoted to preparations for the attack on the Drocourt-Quentan line, timed for Sept. 1 but later postponed to the 2nd. Artillery and bridging material were brought forward, and wire-cutting commenced, while a series of partial infantry attacks took place with the object of securing suitable jumping-off ground. The XXII. Corps (Godley) was now brought in on the Canadian left; the 11th Div. was put in on the N. bank of the Scarpe and the 51st and 8th taken over from the Canadians and VIII. Corps respectively; the 49th Div. was retained in reserve. As a result of the local operations carried out on both banks of the river, Arleux and Plouvain fell into the hands of the XXII. Corps, and the Canadians completed the capture of the remaining German positions W. of the Drocourt-Quentan line. By the evening of Sept. 11 was ready for the narrow’s attack.

This was to be carried out by the 1st Canadian Div. on the right, the 4th Canadian Div. in the centre, and the 4th British Div. on the left on the front from N. of Hendecourt to W. of Sailly, measuring some 5 m. in width. Five hundred guns and 45 tanks were detailed off to assist. The first objective was to be the front line and the support lines of the Drocourt-Quentan system; the second the W. bank of the Canal du Nord between the Arras-Cambrai road and the Scarpe, and the third a line just to the E. of that obstacle. The XXII. Corps astride the Scarpe was to secure the Canadian left. The XVII. Corps (Ferguson), on the left of the British Third Army, was to advance on the Canadian right, after the capture of the first objective, and by passing through the breach made by the Canadians to turn from the N. all the German defences in the vicinity of Quentan, where the Drocourt-Quentan line joined the main Hindenburg line.

The attack began at 5 A.M., rapidly overran all resistance and by 9.15 A.M. had possessed itself of its first objective on all its
front. The Drocourt-Quéant front and support lines were thus in the hands of the Canadians after little more than four hours' fighting. The operation had been brilliant in the extreme, but the exploitation proved more difficult, as neither tank nor artillery support was available in sufficient strength. As a result the advance on the front of the 4th Canadian and 4th British Div. made no progress beyond the line south of Etaing-Dury. On the right, however, the 1st Canadian Div. got forward beyond Cagnicourt and Villers and established its front some distance to the E. of these places. Meanwhile the XVII. Corps pushed the 57th Div. through the gap opened by the Canadians and swung down astride the Drocourt-Quéant line towards its junction with the Hindenberg line, which was at the same time assailed in front by the 52nd Division. Later in the day the 63rd Div. passed through to continue the advance; by nightfall the tangle of trenches and wire at the junction were in British hands and the village of Quéant and Fronville had also been wrested from the enemy.

That night the German Seventeenth Army withdrew its two right corps in haste behind the Canal du Nord, where they again faced round for a renewed stand. Their losses had been heavy; 11 divisions had been defeated with a loss of close on 11,000 prisoners and many guns; the artificial defences had not held up or even appreciably checked the British advance, which now threatened to turn from the N. the whole of the Hindenberg line.

Fortunately for the Germans the Canal du Nord proved a sufficiently formidable obstacle to give pause to the First Army's progress. It was decided that that army should halt and reconstitute for the present, as any further advance could only be carried out by a deliberate and carefully planned assault on the canal line. This attack was not to take place till Sept. 27.

In their operations between Aug. 26 and Sept. 3 the 10 British divisions of the First Army had defeated 13 hostile divisions, and taken from them over 16,000 prisoners and 200 guns. The right wing of the German Seventeenth Army had been forced to fall back some 12 m., abandoning in succession a series of strong and well-fortified defensive systems, the loss of which had an instant effect on the situation to the south.

2. Third Army's Advance to Hindenburg Line (Sept. 3-26.)

As a result of the First Army's success the German Seventeenth Army on Sept. 2 was ordered to fall back to the Hindenburg line, and to commence the move that same evening. By Sept. 8 the two corps (III. and XIV. Reserve) which faced the British Third Army had completed their withdrawal and held the fortified front from Sains on the Canal du Nord by Havrincourt to just S. of Gouzeaucourt, with detachments to the W. of this line, established in the old British and German trenches of 1917.

The British Third Army followed up the retreating enemy, being impeded only by rearguards and trench systems to be overcome, and by Sept. 9 were once more in touch with the main body of the German Seventeenth Army along the whole of its front. At this period the line was held from right to left by the V. Corps (Shute) (21st and 17th Div. in front, 38th Div. in reserve); the IV. Corps (Harper) (5th New Zealand and 37th Div. in line, 42nd Div. in reserve); the VII. Corps (Haldane) (62nd and 2nd Div. in line, 3rd and Guards Div. in reserve); and the XVII. Corps (Ferguson) (52nd and 63rd Div. in line, 57th Div. in reserve).

In order to observe and jumping-off ground for the attack on the main Hindenburg system it was necessary to clear the enemy from the positions still held by him forward of this line. This was successfully accomplished in two operations, on Sept. 12 and Sept. 18. On the former of these dates the IV. and VI. Corps in the centre of the army advanced on a front of five miles between the Cambrai-Péronne and Cambrai-Bapaume roads. The IV. Corps, attacking with the 37th Div. on the right and the New Zealand Div. on the left, occupied Trescault and the heights north of it, while the 62nd Div. of the VI. Corps carried Havrincourt after stubborn fighting and maintained it in face of a series of counter-attacks, delivered with fresh forces both on this and the following day. The 2nd Div. also made some progress to the N., effectively securing the flank of the 62nd and keeping touch with the XVII. Corps, which had been held up ever since Sept. 2 on the W. bank of the Canal du Nord.

Sept. 18 saw the V. Corps on the right of the Third Army attacking in its turn, in conjunction with the Fourth Army to the south. The 38th Div. was brought up into line for this operation on the left of the 17th, the 21st Div. being on the right of the corps front. The attack was fairly successful, though the 21st Div. was unable to attain all its objectives and the 38th Div. was held up in front of Gouzeaucourt, and a series of further minor attacks on the succeeding days proved necessary before the positions required for the general offensive against the main Hindenburg line were completely secured along the whole front of the Third Army.

3. Advance of Fourth Army to Hindenburg Line (Sept. 3-26.)

The results of the fighting on the line of the upper Somme and the Tortille at the end of Aug. and the beginning of Sept. had been such as to induce the German Second Army to give up all hope of putting up any further resistance W. of the Hindenburg line, and to order a withdrawal of its troops to that fortified position. Accordingly, from the morning of Sept. 4th, the British Fourth Army was able to make rapid progress along its whole front. The line at the beginning of this advance was held as follows: on the right was the Australian Corps (Monash) with the 32nd, 5th Australian and 3rd Australian Div. in line, and the 1st and 4th Australian Div. in reserve; on the left the III. Corps (Butler) with the 74th and 17th Div. in line and the 58th Div. in reserve. Face them the front of the German Second Army was held in order from the right by the LIV., XI. and LI. Corps; in all, eight divisions.

The first few days of the British advance passed with little resistance from the enemy, who fell back rapidly under cover of the fire of light machine-guns and isolated field guns. British cavalry and cyclists found some scope for useful activity and considerable progress was made. On Sept. 8, however, the Germans made a stand in the old British battle zone of March 21 on the general line E. of Vermand to E. of Rosiel-Ephey. A series of partial assaults by the various front line divisions having had little result it became evident that a deliberate attack would be necessary to overcome this obstacle. Accordingly the army front was reorganized, the IX. Corps coming in on the right, taking over the 32nd Div., and putting the 1st into line on its left, with the 6th and 46th in support. Gen. Rawlinson then proposed to undertake an operation on a large scale with the object of capturing the outer defences of the Hindenburg line along the whole front of the Fourth Army. These outer defences consisted of two strongly fortified lines, the first of which had been the German outpost line in the spring of 1917 and the British main line of resistance before March 1918, and the second the French and British trenches that had been constructed in the interval. On this line, a mile farther forward, the capture of these defences, which would afford observation over the greater part of the main Hindenburg line proper, was of course an essential preliminary to any operation against the latter.

Accordingly the period from Sept. 11 to 17 was devoted to pushing on the preparations for this projected attack. The line was advanced in several places by means of strong fighting patrols, so as to run on the evening of the 17th from Holnon by Maissemy and Jeancourt to St. Emilie and W. of Ephey. By this time everything was ready for the general offensive, which was timed to commence at 5.20 a.m. on the 18th in conjunction with the First French Army to the S. and the Third British Army to the north.

It was intended that the advance should be carried out in three stages, the final objective (which it was not considered must necessarily be reached on the first day) being the old British outpost line from Thorigny by Pontruet, W. of Bellicourt and of Bony to W. of Vendhuile. This gave a front of attack of some 14 m. in length and involved an average penetration of 3 miles. Twenty-three tanks joined in the attack, which was preceded by no bombardment but was covered by the fire of 978 guns.

Generally speaking the operations of the Australian Corps in the centre were completely successful, those of the IX. and III.
Corps in the wings less so. The IX. Corps, attacking with the 6th and 1st Div. in line, despite difficulties in assembling its forces, reached its first objectives by 9 a.m., but the 6th Division was held up at Holnon, and was unable to maintain itself in Fresnoy, while the 1st Div. got farther forward, but not as far as Pontrieu. The corps lost heavily, though some prisoners and guns were taken. The Australian Corps (4th Div. on the right, 1st on the left) also had heavy fighting, particularly in Levercuier village and the woods N. of it, before reaching its first objective, and was checked in front of the final objective till darkness fell, when the last hostile defences W. of the main Hindenburg line were successfully secured under cover of darkness. The capture of the corps came to over 4,000 prisoners and 87 guns; the attacking strength of the Australians was less than 6,000, and the casualties were just over 1,000 in all. The III. Corps' attack, carried out by the 74th, 15th, 12th and 58th Div. in line from the right, met with very stubborn opposition; the enemy were expecting the attack and fought well. As a result the progress made was less than had been hoped; only the 7th Div. in fact attained the first objective. The 18th was checked after capturing Ronsoy and the 12th and 58th after taking Epêche; 2,500 prisoners were taken and 10 guns.

Force was decided on in view of the incomplete success attained on this day, that the IX. and III. Corps should continue the attack on the 19th, while the Australians consolidated their gains. A series of partial offensives were undertaken on the succeeding days, on both wings of the army, but with little real result; neither corps could succeed in attaining the final objectives of the first day's attack or clear the enemy entirely from the advanced defences of the Hindenburg line.

Meanwhile it had been definitely decided by British G.H.Q. on Sept. 22 that that line should be attacked along the whole front from the Sensée to N. of St. Quentin by the First, Third and Fourth Armies. To the last named were assigned the reinforcement the XIII. Corps and the II. U.S. Corps; the former was maintained in reserve, but the latter was combined with the Australian Corps and took over the left of its front and the right of the III. Corps front, relieving the 1st Australian, 74th and 18th Div. by Sept. 25. The 74th and 58th Div. now left the Fourth Army, which had thus undergone a net increase from 10 to 14 divisions.

During this redistribution the efforts of the IX. and III. Corps to gain further ground continued without cessation. Sept. 21 and 22 saw some progress by the latter formation, which was not, however, successful in completing the capture of the outer German defences before the right of its line was taken over by the 27th and 30th U.S. Div., nor were the new arrivals who carried out their first attack on France on the 26th and 27th able to advance the line to any real extent. On the other hand, during the period from Sept. 24 to 26 the IX. Corps, by repeated efforts, pushed their front to the E. of Gricourt and Pontrieu, thus ensuring favourable conditions for the forthcoming offensive on the right wing of the army.

In the series of operations, described above, the Third and Fourth British Armies had engaged 13 divisions against 29 of the German Second and Seventeenth Armies, and had taken over the front of the Hindenburg line, which now faced the British, has been described in detail elsewhere; it will therefore suffice to say here that, together with the Masmières-Beauvoir line beyond it, it formed a fortified belt some four to six miles in depth, and was in all respects one of the most formidable defensive positions known to history. Despite the risks of failure and the probable consequences of such a failure, from the political and moral as well as the military point of view, it was considered essential both by Marshal Foch and Lord Haig that the attack on it should be carried out and that as soon as possible. In view of the fact that the First and Third British Armies were faced with strong positions in the Canal du Nord and the Scheldt canal, which it was advisable to carry prior to the general attack on the Hindenburg line behind the latter obstacle, it was decided that these two armies should open their operations a day earlier than the Fourth Army, so as to draw off the German reserves from the front of that army, which had to deliver the main attack and was faced with the most formidable defences.

Accordingly the following orders were issued on Sept. 22: "The First Army will attack on Sept. 27 with a view to capturing the heights of Bourlon Wood in the first instance. It will then push forward and secure its left on the Sensée river and operate so as to protect the left of the Third Army. The Third Army will operate in the direction of the general line Le Cateau-Sollesmes. It will attack on Sept. 27 in conjunction with the Fourth Army and attempt to secure the Canal de l'Escaut, so as to be in a position to co-operate closely with the Fourth Army on Sept. 29. The Third Army will assist the Fourth Army with counter battery work on the enemy's guns in the region La Terrière-Villers Outreaux. The Fourth Army, protected on its right flank by the First French Army, will deliver the main attack against the enemy's defences from Le Tronquoy to Le Catelet, both inclusive, operating in this direction of the general line Bohain-Busigny. The bombardment will commence on Sept. 27 and the assault will be delivered on Sept. 29."

5. First Army's Advance to Cambrai (Sept. 27-Oct. 2).—At the beginning of the operations E. of Arras the beginning of Sept., the right wing of the First Army, consisting of the Canadian and XXII. Corps, stood S. of the Scarpe, facing the obstacle of the Canal du Nord and the Sensée. Behind this strong line of defence the German Seventeenth Army had the I. Bavarian Reserve and the II. Bavarian Corps with five divisions in front line and about twice that number in support. The positions held by them were formidable to a degree; the Canal du Nord, although not completed along its whole length, was some 100 ft. in width and its northern half full of water; all the bridges were destroyed, and the E. bank, which commanded the W., had been lined with machine-guns and strongly wired. To the E. of the canal the Germans had an extensive line of defensive positions the Marquion trench line, running from Osly by Marquion to the main Hindenburg line near Graincourt; the Marengue line, covering Cambrai at a distance of some two miles from its outskirts; and the Schlacht canal, from the Sensée at Estrun by the western suburbs of the city to Marconing, Crevecœur and the south.

The task in front of the First Army was thus an extremely difficult one; none the less it had to be tackled, and as early as Sept. 13 the preliminary measures were taken in hand. The XXII. Corps took over the front from the Sensée southwards to the Arras-Cambrai road, and the Canadians relieved the left of the Third Army as far as N. of Masnères. By this means the latter, who were to make the main attack, were brought opposite a portion of the Canal du Nord, which was dry along a front of 1½ miles. The plan was to cross the obstacle here and then to expand the front of attack to a frontage of some 9 m. by pushing out divisions fanwise to E., N.E. and N. It was hoped that the assembly of the attacking troops in the restricted zone opposite the crossing point, the rapid bridging of the dry canal, and the pushing forward of guns to cover the farther advance, and of reinforcements, ammunition and supplies to support it, could all be carried out with the necessary speed and security, although the difficulties encountered were very great and the possible causes of courtretemps numerous.

Zero hour was to be 5:20 a.m. on Sept. 27. The 4th Canadian Div. was in line on the right, and the 1st on the left, and were to carry out the first phase of the attack, as far as the line Fontaine Notre Dame—W. of Haynecourt—Saucaut L'Estree. Up to this line four successive objectives were assigned; from there onwards the second phase of the advance was to carry the assailants to the line of the Schlacht canal and the Sensée. During the pause between these two phases the 3rd Canadian Div. was to come in on the right of the 4th, and the 11th British Div. on the left of the 4th, so that the second phase would be carried out by the 3rd, 4th and 1st Canadian and 1st British Div. in that order from the south.

Punctually at the appointed time, at dawn on Sept. 27, the assault was delivered. The crossing of the narrow defile over the
The canal between Inchy and Mœuvres was carried out according to programme, thanks in large measure to the intensity of the barrage covering the operation. All the field artillery of the Canadian and XVII. Corps were firing on this area, and as a frontage of only 9 yd. was allotted to each gun, the resistance of the enemy was speedily stifled. While the infantry pressed forward to carry the Marquion line bridges were swiftly thrown over the dry canal bed, and batteries were massed as advance supports to take up their positions for supporting the farther advance. The first objective and part of the second were carried on time and without great difficulty, but the left of the 1st Canadian Div., swinging to the left against Marquion, was checked for a time, until reinforcements, including units of the 11th Div., came up to complete the capture of the village and its defences. The second objective was in Allied hands by midday everywhere. Further progress was difficult, particularly on the right, where the 4th Canadian Div., which had outstripped the advance of the left of the Third Army, was held up by flanking fire and counter-attacks from the S., and was unable to do more than establish itself on the fourth objective by the evening, with its right thrown back along the Bapaume-Cambrai road. On this line it was relieved during the night by the 3rd Canadian Div. Farther to the N., the first phase of the attack was successfully completed by 2 P.M., and it was found possible to commence the second phase at 3:20 P.M.

At this hour the 1st Canadian and 11th Div. moved forward. The former stormed Haynecourt, pressed up to and beyond the Douai-Cambrai road E. of that village, and maintained its hold despite renewed and violent hostile efforts to regain the lost ground. The 11th Div. also met with great success, and before nightfall was in possession of Sauchy Cauchy, Sauchy L'Estre, Oisy and Epipny.

The line therefore at the end of the day ran from just W. of Fontaine Notre Dame to the Douai-Cambrai road N.E. of Haynecourt, thence to Epipny and Oisy le Verger. Four thousand prisoners and 100 guns had been taken in this day's advance of some 7,000 yd. in depth on a front of 15,000. The whole operation, investing as it did a most complicated and yet perfect combined action, had been a most brilliant success.

It was decided that the attack should be continued on the 28th, the 3rd and 4th Canadian Div. on the right and the 11th Div. on the left advancing at 6 A.M., while the 1st Canadian Div., which was farther advanced than they, followed suit only at 8 A.M. The Germans resisted stoutly all along the line, but were unable to stem the drive. On the right the 3rd Div. cleared Fontaine Notre Dame and the 4th Salloy and were then held up for the time being in front of the Marquion line, which, however, was completely cleared later in the evening by a renewed attack. The 1st Div. made little headway, but the 11th Div. got well forward along its front and established itself from Epipny to Aubheuchel on the Senseé. Large captures were made besides the substantial gain of ground.

At the same hour on the 29th the infantry again went forward, the objectives being to complete the capture of the Marquion line and the seizure of the Scheldt canal bridges W. and N. of Cambrai. The 11th Div. made no progress, but the line on the rest of the front was advanced to the junction of the roads from Arras and Bapaume in the suburbs of Cambrai and the line of the Douai-Cambrai road and railway, including the village of Sancourt. A certain amount of ground gained beyond the railway to carry the Marquion line bridges was won by violent counter-flows of the enemy against the left of the 1st and then of the 4th Div.

None the less neither side was prepared to give up the struggle. At dawn next day the 3rd and 4th Canadian Div. advanced once more with the object of securing the coveted bridges over the Scheldt canal, to be followed later by the 1st Canadian and 11th Div., which were to clear the peninsula between that canal and the Senseé. A certain amount of progress was made, the village of Tilloy being entered by the 3rd Div. and Bécourt by the 4th Div., but not all these gains could be maintained in face of repeated hostile counter-attacks, and at the end of the day the line ran much as before on the front of these two divisions. The second phase of the offensive as planned could not even be commenced. Another effort was made on the morrow to complete the operation. It met with stubborn resistance from German divisions in line, now increased to ten. These endeavoured again and again to check the Canadian advance by blows against their left front and left from the direction of the influence of the Senseé and the Scheldt canal. The Canadian 3rd and 4th Div. attained their objectives—the line of the canal south of Ramillies and the road between that place and Cuvillers.

The 1st Div. had even more desperate fighting before it succeeded in clearing Bécourt, Cuvillers and Bantigny, and when it had finally captured them a powerful thrust against its exposed left from the direction of Paillencourt forced back the Canadian line to the west of Cuvillers and Bantigny. Meanwhile the 11th Div. on the N., attacking in the afternoon, secured and held its objectives and thus eased the situation on that flank. On the evening of Oct. 1 the Canadian line ran from the western suburbs of Cambrai by Tilloy to the Douai-Cambrai railway W. of Blécourt and along that railway to the Senseé.

This was the final day of the Cambrai battle on the First Army front. After its exertions and achievements during the previous five days of incessant fighting the Canadian Corps was in urgent need of rest and retraining. It was therefore decided to postpone further attacks for a few days, until the effect of the Third and Fourth Armies' advance in the S. should make itself felt. The results of the First Army's battle were in any case satisfactory to a degree.

Though Cambrai itself only fell into Allied hands a week later, its fate was in fact sealed by the five days' fighting which has just been narrated. During its course the First Army's line had been advanced close on eight miles; its four divisions had driven back the 13 German divisions engaged by the Seventeenth Army on their front, and taken from them over 7,000 prisoners, 295 guns and 630 machine-guns, besides inflicting losses in killed and wounded which certainly far outweighed their own casualties.

The last German fortified system had been breached on this front and the first stage—and the most difficult stage—completed of that triumphant advance which was to lead the First Army in six weeks' time, back to Mons.

6. Assault of Third Army on Hindenburg Line (Sept. 27-Oct. 2).
The front of the Third Army on the evening of Sept. 26 ran W. of Villers Guislain and Gouzeaucourt, E. of Trescault and Havrincourt to the line of the Canal du Nord S. of Mœuvres and along its W. bank to that village. From right to left along this front were the V. Corps (33rd, 21st and 38th Div. in line), the IV. Corps (3th and 42nd Div. in line, New Zealand Div. in support), the VI. Corps (3rd and Guards Div. in front, 62nd in support) and the XVII. Corps (52nd and 63rd Div. in front, 57th in support). Facing them the German Seventeenth Army held the Hindenburg system with seven divisions in front line.

In view of the great strength of the defences in the southern section of the Third Army zone it was decided that there should at first be no attack by the V. Corps, but that the salient held by the enemy in that area should be left until the progress of the operations on either flank should endanger the garrison's line of retreat. Accordingly the offensive of Sept. 27 was carried out by the Third Army with its three leftmost corps only.

The task of the IV. and VI. Corps was to clear the Hindenburg front and support lines on either side of the Ribécourt valley as far E. as Highland Ridge (running N. from Villers Plouich) and the spur overlooking Marquion from the west. Five objectives were laid down, and exploitation was to be carried out beyond the final one to Welsh Ridge (N. of La Vacquerie) and the Scheldt canal. The XVII. Corps was first to carry the Hindenburg system on its front and then to advance to the line Graincourt-Anneux, with exploitation if possible as far as Cantaing-Fontaine Notre Dame. Zero hour was 8 A.M.

The 5th Div. of the IV. Corps moving off at that hour early met stubborn resistance and suffered from flanking fire from the south. Beaumont was not taken till 11:30 A.M. after hard fighting, and then had to be surrendered again late in the evening to a
heavy counter-attack. In consequence the right wing of the 42nd Div. was somewhat checked in its advance, and whereas the left of that division, starting off at 7:52 A.M., was well beyond its third objective by midday the right wing had only just completed the first stage of its advance. By 2:30 P.M. the left of the 42nd in conjunction with the right of the 4th Div. (VI Corps) had captured Ribécourt, but the final stages of the advance had to be left postponed next morning.

The VI Corps met with more success. The 3rd Div., overrunning the hostile defences with little difficulty, shortly after midday seized Flesquières and Ribécourt and established itself east of these villages, where the 62nd Div. passed through to continue the advance and carried the line to the outskirts of Marcoing, thus attaining all the corps' objectives for the day. On the left the Guards, despite heavy losses from flanking fire against their left, owing to the fact that the XVII Corps was unable to keep up with their rapid progress, pressed forward between Flesquières and Grincourt and reached the neighbourhood of Prémly chapel (N.W. of Marcoing). They were relieved by the 2nd Div. on that evening.

The XVII Corps had first to clear the W. bank of the Canal du Nord W. of Grincourt before it could attempt to pass it and get forward to its day's objectives. The right division, the 32nd, successfully carried out this operation with a portion of its forces, while other units crossed the canal on the right in conjunction with the 63rd Div., and met with severe resistance. It was not till late in the afternoon that Annex and Grincourt fell into Allied hands and the 57th Div. passed into first line for the further advance on Cantaing, which proved to be impracticable before nightfall.

On the night of Sept. 27, then, the Third Army front ran from W. of Beau camp by Ribécourt, Prémly chapel and Annexes to W. of Fontaine Notre Dame, where it connected with the right of the Canadian Corps—a maximum penetration of some 3½ m. from the jumping-off line. Operations were resumed next day. The IV Corps began its attack at 2:15 A.M. under cover of darkness; Beau camp was once more secured, Highland Ridge was carried by storm, and parties pushed forward to Welsh Ridge which was cleared of the enemy by 6 P.M. The VI Corps, attacking with the 62nd and 2nd Div. as soon as it was light enough to see, cleared the Germans from the W. bank of the Scheldt canal and established itself on the line Marcoing—Novelles; it was found impossible, however, to get over the canal at the moment. The line of the canal was also reached on the XVII Corps' front, E. of Cantaing, and her parties succeeded in getting over the obstacle and establishing themselves there despite the counter-attacks of the enemy.

September 29 saw the V Corps on the Army right joining in the attack in conjunction with the Fourth Army to the south. Little progress was made in this sector, but on all the rest of the front considerable results were achieved. The IV Corps, advancing with the 5th Div. on the right and the New Zealanders on the left, carried Compiègne and Banteux in the right section, securing a bridge-head at Crévecœur in the left section of its zone of attack. The VI Corps to its left had passed the canal in force before the end of the day and established itself to the E. of Masnières; the XVII Corps also got the 63rd Div. over the obstacle, while the 57th Div. on the left cleared the Marcoing line between the canal and the Bapaume—Cambrai road and pushed on to the outskirts of the city itself.

On Sept. 30 and Oct. 1 the advance was continued, but more slowly and with greater difficulty. The Germans, menaced on either wing of the line they had foreseen, withdrew from their salient on the V. Corps' front, and the latter were able to get forward into the canal line and commence preparations for forcing it. The IV Corps secured its footing on the E. bank about Crévecœur, while the VI Corps occupied Rumilly after two attempts, and the XVII Corps on the left flank reached the suburbs of Cambrai on both banks of the Scheldt canal. The battle on the Third Army front was now over. The Hindenburg line had been breached on a front of nine miles, and an average advance of seven miles effected in the face of the most formidable obstacles, both natural and artificial. Thirteen German divisions had been forced to give ground before 12 British, and had left behind them many prisoners and guns during the five days' fighting. The fate of Cambrai was sealed and only a part of the incompletely constructed Masnières—Beauvoir line, already broken in its northern sector by the Third Army and in its southern sector by the Fourth Army, was left as a thin line to stem the Allied advance. That line, as the attack of Oct. 8 was to show, was destined to prove quite insufficient to hold up those troops who had stormed the immensely powerful defences of the Hindenburg system.

7. Storming of Hindenburg Line by Fourth Army (Sept. 27—Oct. 5).—The forces at the disposal of the Fourth Army for the attack of the formidable defences of the Hindenburg line on the front of 12 m. from Senelcy to Vendhuille consisted of the IX. Corps (Brathwaite) (1st and 46th Div. in line, 3rd in support); the composite American-Australian Corps (Monash) (27th and 50th U.S. Div. in line, 5th and 3rd Australian in support, 2nd Australian in reserve); and the III. Corps (Butler) (31st and 58th Div. in line, 18th in support). The IX. Corps' zone of attack included the Canal du Nord and the defences on either side of Bellenglise, while that of the composite corps was the canal tunnel on either side of Bellicot. The III. Corps had the subsidiary rôle of covering and securing the left flank of the composite corps. The first objective assigned to be captured by the divisions in line included the Hindenburg system on both banks of the canal and the Hindenburg reserve line a mile to the E.; once these had been secured the supporting divisions were to pass through and carry the last line of defence, the Masnières—Beauvoir line, between the latter village and Le Trompasy.

The German Second Army, facing the Fourth Army, consisted at this time of the LIV., IV. Reserve and LI. Corps in line, and the XI. Corps in reserve. The III. Corps on the right of the German Eighteenth Army was also partly on the Allied front. Ninety-eight divisions were in line and others in support, but neither physically nor morally were these troops all that could be desired. Moreover, though they must have been well aware that an attack was coming, the date and time were unknown and remained unknown till the moment of the assault.

The preliminary bombardment commenced at 10 P.M. on Sept. 26, and the 50,000 guns all calibres took part in it, yet 50,000 guns were formidable for the hostile defences that the task of the infantry still remained one of great difficulty. This was enhanced by the fact that only in certain sectors where the canal passed under the Bellicot tunnel was it possible to employ tanks, of which some 150 were allotted to the left of the IX. Corps and to the Composite Corps.

Nevertheless, when the infantry broke forward to the attack at 5:55 A.M. on Sept. 29 under cover of the morning mist their advance made rapid progress.

On the IX. Corps front, while the 6th Div. on the right secured the army flank about Gricourt, the 46th Div. overrun all obstacles in its front, swam or crossed the canal, stormed Bellenglise village and the defences beyond, and by 3 P.M. was in possession of its objectives everywhere. At the cost of only 800 casualties it had penetrated some 3½ m. deep into the most formidable part of the hostile fortress, routed the four enemy divisions in its front and taken 4,200 prisoners and 70 guns. It was perhaps the most astonishing single feat of arms in the World War. The 32nd Div., passing through found its task much simplified, and before nightfall had carried the Hindenburg reserve line on practically the whole of its front, taking a further 800 men and 20 guns in its advance, and was able to open the way for the advance of its following divisions. The latter were left behind by the night, and considerable efforts were made to get forward into the defences to the right of the British front. The supporting Australian divisions therefore found themselves in a difficult situation, which was only redeemed by hard and skilful infantry fighting.

On the right of the corps sector the 3rd Australian Div. finally
got as far forward as the Hindenburg reserve line about Nauroy; but the 3rd Australian Div. on the left could make little headway from its starting line, and the hostile defences about Bony remained intact.

On the left flank of the army the III. Corps was able to fulfill satisfactorily the subsidiary rôle assigned to it.

Despite the comparative failure of the Composite Corps the attack had on the whole been a brilliant success, seven Allied divisions having defeated nine enemy divisions encircled in immensely powerful works, capturing from them 5,300 prisoners and 100 guns and effecting such a wide breach in the last German line of defence that its complete capture in a few days was assured.

Gen. Rawlinson decided that the offensive should be continued on the 30th by the U.S. Div. being withdrawn from line for the present. The IX. Corps was to round off its success on the right by clearing the Thorygny area on the near bank of the canal, and occupying the ground on its front as far as the Masnières-Beauvoir line; the Australians were to secure the remainder of the first day's objectives in its sector between Bellicourt and Venthulhe, while the III. Corps would occupy the latter village to cover their left. The IX. and III. Corps were able to carry out this programme without serious difficulty; but the Australians again met with stubborn resistance, and at the end of the day, though their right division, the 5th, had cleared the greater part of the Hindenburg reserve line, the 3rd Div., on the left, working up the Hindenburg line from the S., had been able to get no farther than S. of Bony. The completion of the operation therefore was deferred till Oct. 1, when the 3rd Australian Div., after fighting all night, succeeded by a combined attack from W. and S. in clearing the Hindenburg line entirely and pushing forward to the edge of Le Catelet. The IX. Corps also had a successful day; the 32nd Div., advancing in conjunction with the 5th Australian Div., cleared Joncourt and Estrées and breached the Masnières-Beauvoir line on a mile front E. of the former village. This hold was maintained all next day, despite desperate hostilities to retake the lost ground; two British attacks on Sechurt were, however, repulsed.

During the first two days of October the army front was redistributed in preparation for the general offensive to be undertaken on the 3rd against the last defensive position left to the enemy—the Masnières-Beauvoir line. On the evening of the 2nd the line was held by the IX. Corps on the right, with all three divisions, 1st, 2nd, and 46th, in front line; the Australian Corps with the 2nd Australian Div. in front line; and the XIII. Corps, with the 9th Div. in line, and the 25th and 66th in support. The orders were for the IX. Corps to take Sechurt and Ramicourt and push forward to Montbréham; for the Australians to occupy the line from W. of Ramicourt to S.W. of Ponchaux; for the XIII. Corps to seize the latter place and Ponchaux; and for the XIII. Corps to clear Gouy and Le Catelet.

Zero hour was at 6:15 A.M. on the 3rd. The IX. Corps on the right had heavy fighting, and after attaining their initial objectives about 10:30 A.M. were counter-attacked repeatedly and forced to relinquish Montbréham and some of the ground gained to the south. The Australian Corps also successfully attained its first objectives, though not till later in the evening, so that the exploitation of their success on this day proved out of the question. The main object of the day's attack had, however, been completely achieved, for along all the front of these two corps the Masnières-Beauvoir line was in Allied hands. The XIII. Corps on the left established itself in Gouy and Le Catelet by midday, and though a strong hostile counter-attack recovered the former village for a time the ground lost was regained before the nightfall.

After a redistribution of the front the operations were resumed on the 4th. The main task fell to the XIII. Corps, but little progress was made in that sector, as the enemy, who was believed to be preparing for a withdrawal eastwards, resisted stubbornly and made desperate efforts to hold onto its position. The Australian and IX. Corps also had little result to show for their efforts. Oct. 5th, however, saw the successful completion of the programme, the XIII. Corps taking possession of Beauvoir with the 25th Div. and pushing the 50th Div. on its left wing well north of Gouy towards Aubenchoul in conjunction with the right of the Third Army, while the Australians secured Montbréham. It was to be their last feat of arms in the World War, and they had the satisfaction of knowing, as they left the line on the 6th, that the last fortifications of the Germans on the Fourth Army front had fallen, and that the way was clear into the open country beyond.

During the period between Sept. 29 and Oct. 5 the Fourth Army's 12 divisions had completely defeated 20 enemy divisions, driving them from a succession of defensive lines of unexampled strength and taking from them close on 15,000 prisoners and 120 guns, and could claim for themselves with justice a preponderating share in the decisive victory of the war.

8. Results of the Battle.—The results of the battle may be thus summed up: 55 British divisions had been engaged against 70 German divisions. The latter had been forced to retreat some 20 m. on a front of 30, and had lost 67,000 prisoners, 680 guns and vast quantities of other material, besides their killed and wounded. The formidable defensive system on which the German Higher Command, apparently with good reasons, relied to hold up the Allied advance until the winter should give pause to active operations and secure for their hard-driven troops and wearied people a little respite from their trials and disillusionments, had been burst into fragments, and there was left for Germany's army said resources for staving off disaster.

CAMBRIDGE, England (see 5:90).—The Remains of the amenities of the town, as distinct from the university, were increased by the County Hall in Hobson Street (1913), a Wesleyan church at the corner of King Street and Short Street (1914), and a handsome gate-house to the Leys school (1914). A national plant-breeding institute was in course of completion on the Huntingdon Road in 1921.

The University.—In spite of the incidence of the World War, the period 1910 to 1921, viewed as a whole, must rank as one of great activity in the history of Cambridge University. On constitutional proposals of the official chamber, such as those of conferring greater legislative power on resident university and college teachers with the partial disfranchisement of the Senate and the electoral role (1910 and 1920) or the admission of women to all academic privileges (1920), the university maintained a conservative attitude, but in matters secondary only to those in importance it followed a policy of continuous and thorough-going reform. The courses of study for honours and, more especially, for pass men underwent considerable revision. After prolonged deliberations, Greek, as a compulsory subject, was dropped from, and other notable changes were effected in, the Previous Examination (1919); the regulations governing the pass degree were entirely remodelled (1920); several of the honours examinations, notably the classical triposes and the oriental languages triposes, were reconstituted with a division into two parts, the first of which does not normally carry the B.A. degree with it. New triposes were established in anthropology (1913) and geography (1919), while the mediaeval and modern languages triposes, greatly enlarged in scope, were split into the modern and mediaeval languages triposes and the English triposes (1917). The university further recognized the value of graduate training by establishing the degrees of Ph.D. (1919), and of M.Litt. and M.Sc. (1920). A series of enactments (1912-4) made several changes in the mode of procedure to the degree of D.D. and threw it open to others than those in Holy Orders of the Church of England.

The increasing diversity of studies resulted also in the establishment of new professorships, readerships and boards of studies; professorships of English Literature (1910), Genetics (1912), Aeronautical (1914), History (1919), French (1919), Physics (1919), Aeronautical Engineering (1910), and Physical Chemistry (1920); readerships in Spanish, Modern History, Geography, Agriculture, Agricultural Physiology, Physiology of Vertebrates, Petrology, Pharmacology, Electrical Meteorology and Estate Management; Special Boards for Architectural Studies (1912) and Psychological Studies (1920). Trinity College offered in 1921 to establish a professorship in Gooday.
Aids to learning and research of a more material nature were provided by the erection and augmentation of numerous institutes. The engineering laboratory on the north side of Downing Street was twice enlarged and finally removed to a completely new building on the west side (1911). Part of the buildings thereby vacated, as well as new ones erected close to them, were taken over by the neighbouring chemical laboratories. On the south side of Downing Street were found the Botanic Garden (1910), the Museum of Archaeology and Ethnology (1910–9), the psychological laboratory (1913), the physiological laboratory (1914), the forestry school (1914), the Moltke Institute for, and the Outram Laboratory of, education research in research in biochemistry and biophysics (not completed in 1921). The Arts school, off Bene't Street, a fine brick building faced with stone, designed by G. Hubbard, which contains a number of the lecture rooms and lecture halls, was opened in 1911. In that year the university accepted the Government’s proposal to take charge of the solar physics observatory, then at Cambridge, and therefore necessary accommodation in close proximity to the existing observatory on the Madingley Road, was completed in 1913. Field laboratories in connexion with the agricultural department, situated on the Milton Road, came into use in 1910–1.

Emmanuel College and Queens’ College, to the north of their older buildings in either case, added to their fabric; Cheshunt College found permanent quarters at the west end of Batheman Street (1915), and the eighth site of Sidney Sussex and Corpus Christi College were enlarged and redecorated.

Effects of the War.—The immediate effect of the World War on Cambridge University was a transformation which were two- and threefold. First, there was an enormous reduction of the numbers of teachers and students. There were 3,583 undergraduates in the Michaelmas term of 1913, 1,698 in Michaelmas term 1914, 998 in Michaelmas term 1915, 1,151 of those who had gone was, specifically claimed by professors and students from the Belgian universities, by Serbian school-boys and students, by nurses attached to the First Eastern General hospital (T), first set up in Neville’s Court, Trinity College, in Aug. 1914, and then (1914–15) on the cricket-field of King’s and Clare, and, most effectively, by cadet battalions and officers attending staff courses. The absorption of many university teachers by Government departments and the Bank of England, and academic training by a still larger number of servants of the Crown greatly advanced the cooperation between university and State, which had already begun practically with Government grants to certain of the Medical and other Sciences departments concerned with the instruction of medical students (1914). The cessation of hostilities did not effect any weakening of this tie: the Admiralty, the Air Ministry and the War Office (on behalf of the Royal Engineers and Signal Corps) organized temporary and permanent training schemes in Cambridge for officers, to afford them immediate acquaintance with the latest developments in the science of their respective callings. When the university, containing in 1919 in the value of the money and an abnormal number of students (4,593 undergraduates in Michaelmas term 1919, 4,883 in Michaelmas term 1920), was left with the unpleasant alternative of suspending the whole of its educational efficacy, the Government accorded it (1919), as a kind of off-set to the indifference it had incurred, a temporary annual grant of £5,000, pending the report of the Royal Commission which had been appointed. (B.W.D.)

CAMERON, JAMES DONALD (1853–1918), American politician (see 5.109), died at his country home, Lancaster co., Pa., Aug. 20 1918.

CAMEROON (Fr. Cameroun; Ger. Kamerun; see 5.110). By the Franco-German agreement of Nov. 4 1911 11,000 sq. m. of French Equatorial Africa were added to the German protectorate, while 6,450 sq. m. of Cameroon in the Lake Chad region were ceded to France. An Anglo-German agreement of March 11 1913 settled the frontier of Nigeria and Cameroon between Yola and the Cross River. By the agreement with France the area of Cameroon was increased from about 191,000 sq. m. to 292,000 sq. m. and the pop. from some 2,600,000 to about 3,300,000. In 1913 the white inhabitants numbered 2,071, of whom 1,643 were German.

The additions to Cameroon were "compensation" to Germany for the assumption by France of a protectorate over Morocco (see 5.70). The Hottentots and Zulus lived on two large blocks S.E. from the main bulk of the protectorate, one along the valley of the Sanga to its junction with the Congo, the other reaching the Ubangi. Cameroon thus obtained contact with Belgian Congo and full access to the navigable waters of the Congo basin, while the French colony of Middle Congo was cut into fragments. The transfer of territory took place in 1912 and the Germans established military and trading posts both on the Congo and Ubangi. There had been, however, insufficient time to develop the newly acquired territories before the World War put an end to German sovereignty.

Progress was made during 1907–13 in the development of the economic resources of the country, which consisted principally of palm kernels and palm oil, rubber, cocoa, ivory, timber and live stock. In 1913 3,300,000 rands were earned from the production of ivory, 60% of the wool of commercial value. The plantations of cocoa and rubber largely increased and a beginning was made in coffee-growing. The value of trade, imports and exports, was about £1,300,000 in 1913 compared with £1,700,000 in 1907. Revenue continued to be below the cost of administration, the figures for 1913–4 being: revenue £565,000, expenditure £581,000. Deficits were met by grants from the Imperial Treasury, which was made in railway construction, two main lines being undertaken.

The first started from Douala, in the Cameroon estuary and the principal port, and went S.E. by Edesa towards the central plateau; the second started from Bonaberi, on the Cameroon estuary opposite Douala, and, skirting Mt. Cameroon, was designed to go N.E. towards Lake Chad. In 1911 a direct cable from Douala to Germany was opened and in 1914 wireless telegraphic stations were erected.

Under Dr. T. Seitz’s governorship (1907–10) the administration endeavoured to remove the worst abuses in native affairs, but some improvements were less frequent. The Moslem Fula chiefs in the northern region were patronized and comparatively little interfered with, slavery being continued. Dr. Seitz, on his transference to South-West Africa, was succeeded by Dr. Geelm, who in 1912 gave place to Herr Elshemier, the last German governor. He was assisted by a council on which sat three nominated representative merchants. The seat of Government was at Buéa, on the slope of Mt. Cameroon.

Cameroon was invaded in Sept. 1914 by British and French (native) troops under the command of Maj.-Gen. Dobell supported by H.M. SS. "Cumberland," "Challenger" and "Dove." Cyril Fuller, R.N. Douala was shelled and thereupon evacuated, and the last German garrison surrendered in Feb. 1916.

After the conquest the country was provisionally divided into areas administered respectively by French and British authorities. At first the British administered the Duala region, but it and the whole estuary of the Cameroon river was subsequently transferred to French control, the British retaining charge of the port of Victoria, the hill-station at Buéa, and a strip of territory averaging 70 to 80 m. in width from W. to E. flanking the E. boundary of Nigeria. The Supreme Council for the mandate for Cameroon to France and Great Britain. By an agreement between those Powers concluded on July 4 1919 Britain finally retained the strip of ex-German territory bordering Nigeria. This British strip included in the south of Mt. Cameroon and in the north Dikoa and the adjacent parts of "German" Bornu. The rest of Cameroon, 166,500 sq. m. out of the 101,000 sq. m. of the protectorate as constituted in 1910, fell to France. Those districts which the French had been compelled to cede to Germany in 1911 were reincorporated in French Equatorial Africa and formed no part of the mandated territory. In the mandated area no discrimination in respect to trade could be made in favour of French citizens as against nationals of other states, members of the League of Nations.

During 1920 a provisional boundary was determined by British and French officers who met at various points and this was to remain in force until a commission could be entrusted with the final work of demarcation.

The southern portion of the British area was constituted a province of Nigeria under the administration of a senior resident. The remaining of the territory is incorporated for administrative purposes in the provinces of Muri, Yola and Bornu, to which portions of it adjoin, but in every instance the account of the area is kept separate from those of Nigeria in order that detailed accounts showing the revenue collected and the expenditure incurred can at any moment be produced.

Politically the most important additions to territory under British rule are the Emirate of Dikoa, which has been reunited to
Bornu (with which it is closely connected) and a number of small emirates in the neighbourhood of Yola, which are similarly reunited to the other districts of the district of Jos, including those of Jalingo, Tinto and Bamenda, which form parts of the Cameroon Province, are very little developed, but traces are being made for roads designed to connect them more closely with the neighbouring districts lying in the interior. But the north-eastern part of Nigeria, though it enjoys an almost perfect climate for some four months of the year, has an excessive rainfall and the humidity resulting therefrom is a great drawback to the cultivation of the cocoa. A railway, with a great hill-station which is connected with Victoria by a light railway which was built to serve the extensive cocoa and rubber plantations opened and developed by a number of German companies in its vicinity and in the country on the banks of the rivers Logone and Sanaga, is under construction. The great herbage belt along the coast is an ideal area for the cultivation of rubber as a plantation crop, and a few small plantations are already under way. But the area is divided by the river Cross into two parts, and the unsettled tribes have paid little attention to the work of settlement which the railway is designed to facilitate.

With the exception of the area covered by the plantations, the sphere occupied by the British in the Cameroons is very little developed. The German government has also divided Cameroon into 12 circumscriptions with Duala (pop. about 18,000) as capital. In May 1921 the capital was transferred to Yaunde—a town of 30,000 inhabitants, occupying a comparatively healthy and central position on the central plateau, and 110 m. S.S.E. of Duala. A route for the extension of the railway from Duala to Yaunde was surveyed. In 1920 railroad was at Essa, some 45 m. short of Yaunde. The revival of trade after the World War was slow; but in 1920 the combined value of imports and exports was roughly estimated at over £2,000,000.

See I. von Puttkamer, "Gouverneursjahre" (1914); E. Zimmermann, "Nesbanewur" (1914); L. Hausse, "Durch unbenannte Kameron" (1914); A. F. Calvert, "The Cameroons" (1917); C. Bruel, "L'Afrique Equatoriale Francaise" (1918). A good general map on the scale of 1:2,000,000 was issued by the French colonial ministry in 1920. (F. C. F.)

The Campaign of 1914-5.—On the opening of the World War, Cameroon was invaded independently by such troops—French and British—that the British in Nigeria and the French in Equatorial Africa had at their disposal. The German government was roughly triangular in shape, with its base extending from the estuary of the Wouri E. to the valley of the Sanaga and its apex reaching Lake Chad; with, in the S.E., two tongues of land running to the Congo and Ubangi rivers respectively. It enclosed on the W.S. Spanish Guinea, Nigeria lay on its N.W., elsewhere it was bordered by French territory. The centre and S. of the country are mostly covered with forest or dense bush; in the E. there is much savannah-like land; the northern part is generally covered with bush, but (save in the immediate neighbourhood of the coast) is open and open, mountainous land and with many hill-posts, affording excellent means of defence. The German forces were scattered, but the greater part were about Duala, in the Cameroon estuary, and the chief port.

According to German official statistics the military force in Cameroon in 1913 consisted of 199 Germans and 1,550 natives, and the police force numbering 40 Germans and 1,255 natives. When hostilities began some hundreds of German marines were on the coast, together with a number of sailors belonging to ships which took refuge in the Cameroon estuary. Considerable numbers of natives were employed as askaris, and in the N. one or two Fula chiefs, with their followers, sided with Germans. Col. Zimmermann, an able and resolute soldier, was in command. The Germans, after some success, were defeated at the mouth of the Sanaga by a force under command of Lt.-Col. MacLeay, and the rest of the natives proved hostile to the Germans. As early as Aug. 8 1914 the Germans hanged two members of the principal native family of Duala for treason.

Hostilities opened on Aug. 6 1914, when a small French force captured Bonga, at the Sanga-Congo confluence. The next day Zinga, on the Ubangi, was captured. This prompt action anticipated and prevented an offensive planned by the Germans. The operations were directed by Gen. Aymerich, commander-in-chief in France, Equatorial Africa. That officer next formed two columns: one under Col. Dehut advanced N. up the Sanga valley, the other under Col. Masson advanced W. along the Loga, which joins the Ubangi near Zinga. Both columns were at first successful; their objectives were Logome and Duma respectively, posts in the centre of Cameroon. Almost simultaneously with the opening of Gen. Aymerich's campaign, the S.E., Gen. Largueau in the far N. unsuccessfully attacked the post of Kusseri on the Logone river (Lake Chad region). A second attack, on Sept. 21, was successful. Meantime a British column from Nigeria under Capt. R. W. Fox had crossed the frontier (Aug. 25) and had attacked but failed to capture the hill-fort of Mora which was held by Capt. von Raben. Largeau now sent a French column under Col. Brisset to cooperate with Capt. Fox. On Dec. 12 Brisset occupied Marua, a town S. of Mora, and by that date the whole of the Lake Chad region of Cameroon had been cleared of the Germans except the fort of Mora, where the situation remained unchanged to the close of the campaign. For the most part the British were content to blockade the place, though between Aug. 23 and Sept. 15 1915 unsuccessful attempts were made to storm it. Mora had the advantage of a good water supply.

On the same day (Aug. 25 1914) on which Capt. Fox invaded northern Cameroon, two other British columns² invaded Cameroon. One, starting from Yola, attempted to capture Garua (Aug. 30), failed, suffered heavily and was compelled to fall back on Yola. Among the killed was the commander, Lt.-Col. F. MacLeay. Reorganized and placed under command of Lt.-Col. Welsh Bowen, the Yola column later in the year cooperated with Col. Brisset. The other column, which entered Cameroon in the Cross river district, had been repeatedly forced back by French resistance, and was eventually defeated by a German force brought from Duala and sustaining 188 casual-

²Gen. Largeau (1869-1916) had been a member of the Marshal Expedition to Fashoda and later took a leading part in the conquest and exploration of the central Sudan. He was as commander of the French forces in the Lake Chad region that he directed the French operations in northern Cameroon, later giving Gen. Cunliffe Taylor the command in Oct. 1925 he returned to France. He was killed in command of a brigade at Verdun March 26 1916.

³The operations on this side were under the direction of Col. Sir F. D. Lugard, governor of Nigeria.
ties. All the Nigerian forces were native troops (under British officers), being drawn from the Nigerian Regt. of the West African Frontier Force. Sir F. D. Lugard had contemplated operations on a larger scale than those carried out, but was called upon to supply the Anglo-French Expeditionary Force, which it had been decided should be dispatched.

The decision to send an expeditionary force was reached by the British and French military authorities in the first month of the war, and was part of the Bennett-Dobell agreement. On Aug. 31, Gen. Charles M. Dobell, C. in C., Expeditionary Forces, and Gen. M. Mayer, C. in C., the French Expeditionary Force, were ordered to advance from Edea on May 1. On May 3 Haywood, whose line of march was N. of that of the Mayer column, came upon Wum Biagas, a strongly entrenched river position. This Haywood captured and occupied. Later the British forces under Mayer took over the command of the two columns, British and French, in the further advance on Yaunde. In all he had about 2,000 men, 300 of whom was brought from Edea and were fresh.

Gen. Dobell, though he now knew that little help from Yaunde was not likely, decided to continue operations. Col. Mayer therefore left Wum Biagas on May 25, but from the first he met with strong opposition. In the dense bush, which the fierce active and elusive enemy, the rate of progress was no more than a mile a day. Yaunde was still 40 m. distant and dysentery had broken out among the troops. Col. Mayer informed Gen. Dobell that any further advance was impracticable. This withdrawal was greatly impeded by the Germans, and at a critical moment Mayer was reinforced by Rear-Adm. Conyngham, and was not compelled to fall back before enemy counter-attacks. On Aug. 25-6 a conference was held at Dualla--between Gen. Dobell, Gen. Aymerich and M. Merlin (government-general of French Equatorial Africa), when arrangements were completed for the final advance. Gen. Dobell renewed his offensive on Sept. 23; Conyngham moved early in Oct.; Hutin and Morrison steadily pushed on from the east. Dobell had now received considerable reinforcements for his force had now rather than 100 men. Conyngham had from 1,000 to 4,000 men; Aymerich about the same number; the French forces on the Spanish Guinea borders were 800 strong. The maximum Allied strength in the field was about 15,000. Except for a battalion of the Indian Army (sent to Cameron nearly at the end of the campaign—and as a disciplinary measure) and a battalion of the South African Native Contingent, the besieged force were African natives. The German forces, old and newly raised, were estimated at a total of 10,000, including fully 700 white combatants.

For his final operations Gen. Dobell sent forward British and French columns separately—Coll. Mayer advancing once more from Edea, the British under Col. Haywood from positions farther north. Again the dense forest was traversed, but now in the dry season and with adequate supply arrangements. The Germans, as before, vigorously opposed both the British and French columns. On Oct. 9 the British retreated Wum Biagas and on Oct. 30 the French took Ekeia, the railroad. The British won the forest first, but by Nov. 15, when a column under Col. H. Bruix, a.m. 300 m. W. of Yaunde. Four days later the French column, which had had many casualties, was at Mangela, 20 m. S.E. of Mangas. The British column, acting on Dobell's instructions, had not waited for orders or orders from the rear, and took more than 500 m. W. of Yaunde. Coll. Zimmermann's force had also captured a fact which closely to the main lines of the Allied strategy in the future operations, namely a combined and concentric advance on Yaunde. Meanwhile, to prevent Col. Zimmermann, if he broke through from the north, from reaching Yaunde from reaching Yaunde, the Germans had been in the forest and destroying the forest, and aware too of the approach of Conyngham and Aymerich, had determined to give up the contest. Together with the governor and 823 other Germans (including civilians), his native troops, he evacuated the capital. Supplies from the general Spanish Guinea, the nearest point of which was, however, 125 m. distant. He was at once pursued, and in a rear-guard action fought on Jan. 8. Col. Haywood released 32 British and French who had been held in Edea. Col. Brisset's column coming from the N.E. was the first to reach Yaunde; then came Aymerich's columns, and Col. Morrison was detached to continue the pursuit of the Germans.

Culmille’s troops had had very stubborn fighting during this closing phase of the campaign, the most difficult operation being the capture (Nov. 4–5 of Bayon, a hill-fortress which lay some 200 m. N. of Yaudn and on the edge of that corner of Cameroun, the region towards the Cross river, where German resistance was continued to the last. In this quarter the Germans continued to offer determined resistance to the French forces, and when on Jan. 2, 1916 Culmille learned that Yaudne had fallen, his advanced troops were still 40 m. distant from that objective.

The efforts made to cut off Col. Zimmermann before he could reach the general territory failed; the first part of his force entered Spanish Guinea on Feb. 4 and the other detachments quickly followed, and when on Feb. 18 1916 Capt. von Raben and his gallant garrison at M. Zimmermann were taken prisoner after nearly 18 months blockade, the conquest of Cameroun was complete.

CULLIVIK, EMILIE (1878–1915), Belgian poet, was born at Brussels March 16 1878. In 1908 he settled in England. His earlier works include four volumes of translations of Ruskin into French, and Les Bellis, an essay in art criticism; and he has also written two plays, Les Deux Bossus (1917) and La Veillée de Noël (1917). It is, however, by the poems written during the World War that M. Cammaerts attained his widest popularity. These include Belges Poésies (1916); Deux Poésies (1917); and Messines and Other Poems (1918). He also produced Théodore Camu (1917), an account of the sufferings of Belgium during the World War.

M. Cammaerts married Tita Brand, a daughter of the singer Madame Marie Brem. Madame Brand-Cammaerts became well known during the World War for her recitations of her husband’s patriotic poems. Après Anciens, set to music by Sir Edward Elgar under the name of Carillon, was one of the greatest popular successes during the first two years of the World War.

CAMOUFLAGE (from Fr. camoufler, to blind or veil; It. camuffare, to make invisible; or camoufle, to disguise), a method used to make an object invisible, or to change its appearance so that it becomes inconspicuous. There are two main methods of camouflage: (1) by using paint to make similar objects appear to be the same thing; and (2) by using patterned materials which resemble the object to be concealed. The principle is made use of by military engineers for nearly two centuries. Resting among dead leaves it can only be located with the greatest difficulty. More often the animal can be found by careful search, but is likely to be overlooked, as, for instance, a tiger crouching amongst dead rushes. In all such cases a direct imitation, more or less exact, is made use of. The application of this principle in land warfare is discussed in section II below. The replacement of real trees by almost exact copies, internally fitted as observation posts, is perhaps the best-known example of camouflage of this kind as practised in the World War.

The method of general inconspicuousness may be described under: (1) colour; (2) tone; (3) outline, and (4) modelling and cast shadow. These are the qualities by which of an object is revealed and thus are those which an animal desiring not to be seen must conceal.

1. Colour.—The sandy-coloured desert animal and the green caterpillar are examples of the use of colour to produce general inconspicuousness. Browns, greens and greens, being camoufl, but if ground colours, are usually used. Bright colours such as yellows and reds are occasionally made use of, for instance, by insects amongst autumnal foliage. Even during military camouflage had been systematically studied, most armistices had adopted inconspicuous field service uniforms.

2. Tone.—This is a quality of great importance in camouflage, for it is the tone that all animals camouflage with. The tone is important for the purpose of concealment, even though somewhat less in either local colour. An animal which is either darker or lighter than its surroundings will be difficult to be revealed, and it becomes with camouflage it was found that the right tone could be more easily detected by touch than by, for instance, pigment. Thus, the imitation of grass could not be made with green paint on smooth surfaces because from one point of view it might simulate well, but from another angle it would reflect a light (see section II below). Roots of buildings were concealed by covering them with hay, hemp or brushwood, the rough consistency of the surrounding the appearance of rough ground so produced could not therefore be obtained by any kind of painting. But although texture is of so much importance, it must not be forgotten that local colour can be concealed by using the right tone.

The aeroplane photographer used plates sensitive to particular coloured lights or colour filters which had the same effect, namely the detection of any fault in local camouflage. The Germans used a green sensitive plate which, no doubt, would have revealed a brown tiger, if not its head was erected on the green line, even when the tone-match had been good. Moreover, the aeroplane carries a human observer as well as the camera.

Outline.—The production of inconspicuousness by pattern is utilized by animals moving from background to background, which are now seen against foliage and now against brown earth. An animal broadly patterned in green and brown will appear inconspicuous both when it moves among those tones and when it stands out against the background by its characteristic outline or silhouette. Against earth, only the green of the parti-coloured animal will be seen, and this will not have the characteristic shape of the animal, nor will the brown animal’s outline be revealed against foliage. The principle of the efficient pattern is one which greatly disrupts the characteristic shape; one, for instance, which breaks out at conspicuous angles or across only rare and irregular lines and which commonly exhibit a pattern which divides the head into two, along the line joining the base of the hill with the shape of the neck, and the characteristic straightness of the tail is broken by cross-bars of pattern. A thin, dark or light, line separating the components of the pattern greatly aids its disruptive effect. This method of concealment has been used for guns and other objects, on which patterns of dark green and brown, separated by narrow black lines, were painted in large irregular blotches across the barrel, wheels and limber (see section II below).

There are other ways by which of outlines may be concealed. Among birds and fish these are the principles of: viewed at a distance, the fringed edge has a blurred appearance causing the object to fade into its background. This principle of the fringed edge was freely and successfully employed in military camouflage, notably in the use of the flat-topped gun covers described in section II. Among insects an edge is often made to appear indistinct by a small marginal pattern of dark and light tone. When viewed at such a distance that the pattern is blurred, the edge goes out of principle, the margin is not a disruptive pattern, which are only effective as long as they are visible, whereas the marginal patterns are only effective beyond their blurring distance.

Modelling and Cast Shadow.—Modelling is revealed to the eye by the varying amount of light reflected from different parts of the object, and also by the shadow cast upon surrounding objects. Animals and birds are usually different as regards those parts which are turned towards the light dark in tone; and those away from the light, light in tone. It is common to find the backs of birds dark-brown or black and their breasts white. When

*These figures indicate the volume and page number of the previous article.
viewed in the open, the high light which is reflected from the back is app-arent to both fowkthers; and the darkness of the darkside parts is partially neutralized by the white breast feathers. The whole bird will thus appear evenly toned like a flat object and for this reason will be inconspicuous.

The method of counter-shading, was occassionally made use of in military camouflage.

As regards the concealment of cast shadow, the only method employed by animals is to avoid them. Insects will turn and face their heads to make their closed wings will offer a line parallel to the ground; others will tilt their wings parallel with the ground, thereby hiding the shadow which they cast. In military camou-glage, it added the difficulty of an idea to be faced. An inno-cent and successful method was evolved in the case of the flat-top gun cover. The cover consisted of wire or fish netting, on which strips of canvas were threaded and knotted. These strips were counter-shaded in imitation of leaves or earth. By thinning out the knots at the edge, the shadow of the thickly knotted centre was hidden by the sparsely knotted margins which them-selves cast little or no shadow.

The above outline will suffice to give a general idea of the relation between animal colouration and camouflage. But it should be added that the camouflage has much greater difficulties to con-tend with than has the animal on account of the extremity of its task. But we accurate and systematical observations made by the enemy with the eye from forward observation posts and kite balloons, and with the camera from aeroplanes.

II. Military Camouflage

The word "Camouflage," in the broad sense of military de-ception, is applicable to all stratagems designed to mislead the enemy. In the following account it is used in the restricted sense of "deception practised through the agency of artists."

The application to war of camouflage, as thus defined, is by no means novel; dummy guns have been successfully employed to mislead an opponent on occasion ever since guns became a normal part of warfare. Old Washington, Maryland, in his Civil War, and nado records an instance in which the ruined wall of a blockaded town was repaired, without attracting the enemy's attention, under cover of a cloth screen painted to resemble a battlemented wall (circa 1864). The Venetians are reputed on one occasion to have imposed terms of peace on Ragusa by the expedient of building a threatening fort of cardboard in a position commanding the town. According to Lord Raglan, lord Tournai (1513), the defenders used lengths of canvas, painted to resemble trenchedwork, to mislead the besiegers as to the extent of the defences. Other instances could no doubt be brought forward in which camouflage was practised by individuals as an expedient. But it was not till the World War that it was practised by armies as a policy.

A transitional stage between the spasmodic use of camouflage in emergencies and its regular and systematic use as in the present day is marked by the use of painting, or camoumouse, of coast defence forts to blend with their surroundings, in order to render them less conspicuous from the sea, e.g. Cork harbour, Isle of Wight, Spithead, Scapa.

The well-known chequered black-and-white of the Spithead forts was an attempt to mislead the enemy as to the exact location of the gun embrasures. The same artifice was used in the case of the loopholes in the South African War of 1901-1902.

A further stage was reached in the adoption of uniforms coloured to blend with the usual or typical colours of the countryside in a theatre of war. The first of these was the Indian Khaki (see 15770), and after the experience gained in the South African War, when the importance of concealment came into great prominence, the British and most other armies soon adopted dust-coloured, light-blue, grey, or grey-green uniforms.

 Shortly after the South African War, experiments in the dis-ruptive painting of guns were undertaken, but the system was not adopted, and no further development in the practice of camouflage took place until the war of movement of 1914 gave place to trench warfare. Hitherto deception in war had been limited to the comparatively simple task of deceiving the human eye, at a considerable distance, and for a short time. In the World War its rôle was extended to circumventing the camera, in addition to deceiving for long periods, the eyes of observers armed with powerful glasses. For the first time in history, a military unit was organized for the definite purpose of practising scientific deception.

This policy was initiated by certain French artists serving in a French battery towards the end of 1914. The interest of a French army officer was aroused and he sympathized and assisted the result that a "Section de Camouflage" was formed early in 1915, for the purpose of assisting units in the concealment of battery positions and other military works, and the construction of concealed posts of observation. The success attained by this section led to the organization of the British Camouflage Service as a unit of Royal Engineers, early in 1916.

The method of organisation for ordinary camouflage is directly attributable to two novel features of the war, firstly the prolonged period of stationary warfare; and secondly, as an outcome of the first, the rapid development of aviation generally and of photography from the air in particular. Stationary warfare entailed the pro-longed occupation of definite localities by troops, guns, and other numerous apperances of war, whose installation tended to become semi-permanent instead of temporary. It was therefore possible for each opponent methodically to examine the other's battle area in detail, and at comparative leisure, instead of relying on promiscuous and hurried reconnaissance, as in the past.

It was the perfect recognition of photography provided the best means of executing such detailed examination, and presently the art of interpreting air photographs almost reached the level of an exact science. The information thus obtained far exceeded in quantity and accuracy that gleaned by observers, who could not but be distracted by the expanse of the view beneath them and the incidents of their adventourus journeys. All the resources of science were therefore devoted to the production of lenses, plates and colour screens, specially adapted to the needs of military intelligence. This evolution in the means of obtaining information necessarily called for a similar evolution in the means and methods of deceiving, and a special service was or-ganized for the study and practice of the science of camouflage.

The taking, developing and study of photographs demands a certain amount of time and special appliances, and still more so does the study, production, and application of camouflage, of which the progressive stages are performed on foot, in a large well-equipped factory, and in slow-moving lorries and trains. As long, therefore, as a condition of stationary warfare obtains, the maintenance of a special organization to practise camouflage is both necessary and possible.

But the conditions of a war of movement are quite different. Installations and constructions of all kinds are few. The occupa-tion of localities by troops and guns is fleeting, and, in conse-quence, the camera loses its specialized usefulness. It follows, therefore, that the elaborate concealment of gun positions or other works is no longer necessary. Nor is it possible, for the transport, on which the camouflage service relies, is engaged to its utmost capacity in conveying the vital necessities of war, i.e., food and ammunition; and at the same time the factories, on which the supply of the material of camouflage depends, are being left farther and farther in the rear—or being engulfed by the advancing enemy, as the case may be.

When accurate means of locating positions are employed, expert methods of concealment become essential; when the converse obtains, extempore methods suffice, though some form of portable camouflage, designed for use in moving warfare, and carried as part of their normal equipment by fighting troops, would be preferable.

There is ample evidence to prove that the Central Powers took no steps to organize a camouflage service till late in the war, though examples of concealment were universal. Captured docu-ments bear few allusions to the subject until after the battle of Cambrai in Nov. 1917. In the great offensive of March 1918, the Germans captured many specimens of camouflage together with pamphlets on the subject which they translated and distributed to all formations; at the same time arrangements were made for the quantity production of materials for concealing gun positions. In the Entente offensive of autumn 1918 many specimens of this material were captured for the first time, together with numerous exam-ples of instructions on the practice of camouflage.

The principles and practice of camouflage may be dealt with under three heads: (1) the concealment of gun positions and the like from the enemy’s aeroplanes ("air observation"); (2) the concealment of observation posts and machine-gun emplacements from direct view ("direct observation"); and (3) miscellaneous applications of camouflage.

(1) A camouflage agent ("Camouflage") is to render objects indistinguishable, or un-
recognizable, by means of imitation or disguise. Concealment in the limited sense of "hiding from view" is not the primary aim. The ideal is non-interference with the natural, or normal, aspect of the locality, as viewed from the air, with which the enemy has become familiar. This is an ideal which can only be reached by close attention to detail, and by the exercise of forethought and imagination. Preliminary study of an aeroplane photograph of the locality will enable the effects of preparatory work, and subsequent active occupation, to be foreseen, and consequently make it easier to plan methods of combating them. These methods must be put into force before commencing work. To do so afterwards is futile, unless it is certain that no observation from the air has been possible during the progress of work.

The processes of successful camouflage are closely analogous to those in the real world. The preliminary reconnaissance, suppression of clues, provision of false clues, variety of method and concealment of the crime itself.

In the following study of the principles of camouflage the subject is dealt with in relation to the concealment of gun positions. In practice many other works were also concealed, such as machine-gun emplacements, defences, dumps, mine spoil, gas projector installations; but similar problems are encountered in all these cases.

Gun positions can be located by (a) aeroplane photography, (b) air observation, (c) flash spotting, (d) sound ranging. The two last furnish certain limited information. Beyond the use of flashes, no method of frustrating them has yet been evolved. The manifest remedy (failing a silent, flashless propellant) is the skilful employment of dummy flashes and synchronized reports. But it is principally by means of photographs taken from the air that positions are definitely located on a map. The chief opponent to be overcome, therefore, is the expert, who, with the advantages of time and undisturbed concentration, which are lacking to the aeroplane observer, is able to interpret what is recorded on photographs. The aeroplane observer cannot, however, be altogether disregarded, and, although the main efforts must be directed towards defeating the air photographer expert, it must be done in such a way as not to draw the attention of the observer.

The camera is a most accurate witness, and a photograph will always record something. The art of camouflage lies in conveying a misleading impression as to what that something signifies. The photograph records colours and accidents of ground (such as bare earth, vegetation, woods, etc.) in terms of light and shade, and is a patchwork or pattern of black and white meeting in varying intensities of grey. The pattern may be largely a simple and limited information. Beyond the use of flashes, no method of frustrating them has yet been evolved. The manifest remedy (failing a silent, flashless propellant) is the skilful employment of dummy flashes and synchronized reports. But it is principally by means of photographs taken from the air that positions are definitely located on a map. The chief opponent to be overcome, therefore, is the expert, who, with the advantages of time and undisturbed concentration, which are lacking to the aeroplane observer, is able to interpret what is recorded on photographs. The aeroplane observer cannot, however, be altogether disregarded, and, although the main efforts must be directed towards defeating the air photographer expert, it must be done in such a way as not to draw the attention of the observer.

It is now possible to sum up the theoretical conditions which govern the concealment of gun positions, and other works, from the enemy in the air:

(a) The material of which the camouflage is composed must at all times be so matched with the object or surface that represents, and likewise appear natural to the observer. The material, it must be light, strong, impervious to weather, fire-proof and easily manufactured. (b) Disturbances of soil, tracks, shadows, blast marks and the proximity must in no case be associated with an active gun position or occupied work.

Practical Application.—We come now to the application of these principles. In the early part of the World War air photography was not the highly specialized art it subsequently became, and therefore the difficulties of combating it were not so great. At first, freshly cut branches and grass were used, being the materials nearest to hand. These were used in the course of a few days and ceased to be efficacious. The next stage was the employment of sheets of canvas painted to represent the ground. The design was bold, and consisted of large masses of green, or brown and green as the case might be, with heavy black shading, to give the effect of texture. These covers were draped over the guns and came down to the ground on every side, being removed when the gun was in action and replaced immediately afterwards.

This system proved unsatisfactory. It is nearly impossible to reproduce on a smooth sheet of canvas the changing tones of the ground as recorded by the camera. Under certain conditions—i.e. when the angle of light incidence is small, or after rain—painted canvas, having no texture, reflects so much light that all trace of pattern or colour is lost.

Then came the introduction of fish netting. At first these nets were garnished spasmodically with bunches of painted raffia (gardeners' boast). The effect was excellent; the nets were light and portable; but the inflammability of the painted raffia was a grave disadvantage. Efforts made to dye the raffia and to render it fire-proof proved fruitless. The dyes, especially green, were too fugitive, and no method of rendering the raffia permanently fire-proof could be discovered. Strips of painted canvas, instead of raffia, proved more satisfactory from the manufacturing point of view, but these also suffered from the defect of inflammability, though in a lesser degree. The final evolution of the gun cover was a net having an opaque centre of painted scrim, the shape of which was boldly irregular, with a border of painted canvas strips decreasing in density towards the edges, erected horizontally, like a carpet, over the work and much larger in area than the work itself (see fig. 3). Thus, the camouflage was concealed by the opaque centre, the shadow of which was blurred or masked by the border of strips which, in themselves, were not sufficiently dense to cast a shadow. If skilfully erected and maintained such covers were satisfactory. Installed before any work of excavation was started, subsequent construction and occupation remained concealed. Guns could be treated individually or collectively by justifying the area covered. Figs. 1 and 2 show the treatment of a battery position placed under the edge of a bank. The false edge of the "bank" should be noted.

The use of netting was practically confined to works whose nature demanded covers erected at a considerable height above ground level. Scrim was used, by itself, to conceal objects near, or on, the ground, such as short lengths of trench, ammunition, gas-projectors; it should always be reinforced by natural material to increase its texture effect. Further, this material must always be cut or assembled in large fantastic shapes, in order to appear natural, and to allow its edges to merge gradually into its surroundings.

Many gun positions, which had defied all attempts at location, were betrayed by snow, particularly in respect of blast marks, because the flash of discharge melts the snow over a large area immediately in front of the gun. Further, shadows were accentuated, and the normal method of combating shadows, by the adoption of thinned edges, proved fatal in snow, as such nets did not hold the snow and consequently appeared as black holes in a sheet of white. White calico proved a palliative, especially in the case of blast marks, if boldly irregular in shape.

Evidence afforded by tracks is perhaps the most difficult of all to eliminate. Frequently positions, which are admirably concealed in every other way, are betrayed by the tracks leading up to them, so much so, that it is often possible to count the number of guns in a battery by the paths leading to each gun-pit and to distinguish between gun positions and other works. It is comparatively easy to plan the approach so that it may be concealed naturally or artificially; the difficulty is to ensure that this and no other route is used—human nature being so strongly addicted to taking short cuts, barbed wire and discipline seem to be the only means of preventing it.

The following afford good illustrations of methods of concealing approaches that have been adopted with success: (a) Leading the track close past the gun position and on to join an existing track. The connexion to each pit being treated with camouflage material or cut grass, etc., etc. (b) Similarly, but close in front of the gun-pits in order to use the track to hide blast marks. This method has the disadvantage of restricting traffic while the guns are in action. (c) Siting a battery in the midst of an existing network of tracks, taking precautions to reproduce on the camouflage any path interrupted by a gun-pit.

It is not practicable to conceal long trenches. If a covering sags or differs materially in tone from its surroundings the mere length and regularity will betray it. A covering, originally perfect, will require continual attention to keep it perfect, involving labour out of all proportion to its value. Short lengths of trench can be concealed, provided care is taken to support the camouflage adequately to prevent sag, and to conceal the spoil.

This applies equally to trench systems prepared far behind the lines for use in the event of a retirement. It is probable that the enemy, foreseeing the construction of such a defensive line, will be able to guess the approximate position of such systems, and be certain to have periodically photographed the suspected area. It is quite impossible to prevent some traces of work being evident in a long uniform trench system. Camouflage must obviously be restricted to vital spots, and extreme care must be exercised.

(2) Camouflage against Direct Observation.—The concealment of observation posts was comparatively simple, being merely an adaptation of the craft of theatrical property-making. Natural features were selected, in places from which good observation could be obtained, and these were copied exactly. At night, the real was removed and replaced by the imitation. A large variety of objects were so copied among which may be mentioned:—trees, sand-bags, milestones, mounds of earth, chimney-stacks, walls. In all cases the copy was a thin outer shell containing a bullet-proof lining in order to give confidence to the occupier. The loopholes, when subject to scrutiny at short range, could be made quite indistinguishable by the use of gauntlets, which, though painted to resemble the exterior of the O.T., were transparent from the inside. This method was only adopted when absolutely necessary, because gauge interferes with vision—especially through glasses; in other cases care was taken to give the loophole an irregular shape.

Certain conditions were found to govern the successful employment of these observation posts, particularly in the case of the more elaborate examples such as trees.

1. Concealed access is essential.
2. The work connected with installation must, like other work, be concealed from the air.
3. They should not be erected in places that are normally subject to heavy shelling, for the reason that careful observation will be prejudiced and accidental damage will probably reveal the observation post to the enemy.
4. Provision must always be made to prevent daylight showing behind the loophole, so rendering it transparent to the enemy.
5. The comfort and security of the observer must always be studied, otherwise the full value of the observation will never be obtained.

Imitation trees (see fig. 6) were designed either to accommodate an observer at a commanding height above the ground, or to conceal a long periscope, the user of which was protected in a strong dug-out. In the former case the observer had a better view, but was uncomfortably cramped. The periscope is limited
in respect of magnification, field of view, and clearness of vision, in proportion to its length. On the other hand advantage may be taken of its length to obtain high command with comparative security, or increased security with low command. Further, with suitable mountings, it can be used as an instrument of precision in conjunction with map and compass. Provision could be made for giving bullet-proof protection to the periscope when in use, and to allow of its being lowered for cleaning and safety when not in use.

It was sometimes necessary to construct machine-gun emplacements for defence in positions that either were, or might be, exposed to direct view. In certain cases the emplacement was incorporated in some existing ruin, parapet, or like-like protection, where it was only necessary to conceal the embrasure. This was effected by the use of gaue painted to resemble the exterior, either in a hinged frame which could be removed for action, or fixed and fired through when need arose. In other cases the emplacement was in the open. In such circumstances full precautions had to be taken to guard against detection by the camera also. An additional danger lay in the risk of detection from low-flying aeroplanes. To meet this a moveable cover was evolved, in the nature of a lid, suitably disguised to resemble the surroundings (see figs. 4 and 5). Normally this lid reposed on the top of the emplacement, overlapping it considerably; in action the lid could be raised vertically a foot or two, still affording protection against view from overhead, and also, to a partial extent, against long-distance direct view. The lid was raised by a spring, and was closed by a cam; the enemy is not in the province of camouflage, in that no deception is attempted, the main object being to conceal traffic from direct view.

In a few instances true camouflage was practised when a screen passed over the lid. A view from a position's observation was erected between the road and the enemy, so that the road would always appear unused even while traffic was passing behind the screen. Such an expedient was restricted to a few favourable places, such as occasionally a gap in a road otherwise entirely hidden from view, or open spaces in a village where the ruins for the most part obstructed the enemy's view. These screens were impracticable in cases where the portions to be concealed exceeded a few yards in length, as they were exposed to the weather and casual shelling, and therefore had to be very strongly constructed. This, combined with the necessity of complete erection at night and the fact that they could be used only where the locality was not subject to marked seasonal changes, considerably limited their use.

(3) Miscellaneous Applications of Camouflage.—It was only natural that, after a camouflage unit had been organized, with skilled personnel and well-equipped workshops, there was a wide field for the display of ingenuity. For the most part the field has been covered in the foregoing sections dealing with the methods of combating air and ground observation, but it will be of interest to give a short description of devices that fall outside these two categories.

**Dummy Attacks.**—In 1917 the practice of raiding the enemy trenches increased in frequency and scale, and in order to secure the best results with the least expenditure of life, dummy attacks were frequently staged on the flanks of the real front of attack, and set in motion a few moments before it. The dummy or "Chinese" as it was called, attack consisted of numbers of life-sized silhouette figures, made of stout millboard and painted to resemble the various postures of advancing troops. These figures were placed in scattered groups of ten, and suitable arrangements made to raise and lower them at will from some place of safety, so that they simulated waves of advancing troops (see fig. 7).

In this way it was possible to partially obscure or partially obviate by smoke, they were very realistic, but success depends on skilled figures rather than on the painting. Directly the enemy's fire was drawn the real attack was launched with the comforting knowledge that many precious moments must elapse before the enemy could switch his fire off the dummy attack on to the real attack.

Similarly, the location of enemy snipers was facilitated by the use of dummy heads made of papier-mâché. These were exposed over the parapet, in a life-like manner, in order to draw the fire of an enemy sniper. If the head was hit, it was possible to locate the exact position of the sniper by producing the alignment of the holes of entry and exit of the bullet. It was necessary to paint these heads with a matt surface, darker in tone than the natural, in order to imitate the texture of the human face.

**Sniper Suits.**—The concealment of snipers and scouts was facilitated by the wearing of costumes painted to match the surroundings. When garnished with local vegetation, and used as such, the snipers were extremely difficult to discern. Fig. 8 shows an exceptionally tall man lying quite in the open, but wearing a sniper's robe. Fig. 9 shows, in contrast, two men firing from behind a turnip heap, the one wearing the ordinary uniform cap and the other a sniper's robe suitably garnished. In each case the photographs were taken at a distance of only 8 yds.

**Disruptive painting,** as a method of reducing visibility, has been alluded to in an earlier section of this article. Its simplicity makes a strong appeal to the imagination, and a large number of objects, including guns, were so treated. The colours employed were, green, brown, and black, and by skilful application to the entire area, or to partial areas of the object, the disruptive effect is nullified by their mass, heavy shadows and quite inevitable regularity of lay-out.

**Camouflage Material and Its Production.**—By no means the least difficult part of the whole problem of camouflage was that of producing the material in sufficient quantities to meet the enormous demands. At first each position was treated individually as a separate problem, but it was very soon obvious that this principle was desirable it was quite impossible, in view of the number of positions to be dealt with. It was evident that a system of standardization was imperative, in conjunction with some method of adapting the general to the particular. Standardized manufacture was therefore adopted. It was recognized that in certain cases standardization could not be applied; but experience showed that the profusion of such cases was extremely small. In all cases the material was capable of some degree of adaptation to local conditions.

For gun positions, etc., three distinct media were furnished—fish nets, wire netting and scrim.

**Fish nets.**—The nets themselves were supplied from England, the size, 30 ft. by 30 ft., was fixed as being the minimum suitable for universal application; one or more nets could be easily joined if necessary. The nets were woven "square" in contradistinction to "diamond" for the reason that the former offered no creases or "principle of "lazy tongues." The meshes were 2½ in. square. The outside was bound with strong cord to take the tension, and the whole was treated with a very persistent and very strongly-coloured liquid which had previously been described. The nets were commonly used for all types of guns and were in demand because of their comparative portability.

**Wire Netting.**—This was used in large quantities also, being stronger than fish netting, though less portable. For convenience in handling it was made up in rolls 30 ft. long, averaging 6 ft. wide, and was garnished in a fashion similar to fish netting, except that the thinning-out could only be applied to the outside. In the field these rolls were joined up to suit the work they were intended to cover, and the thinning-out process was completed on the site.

**Scrim.**—This, already mentioned, was mainly used on or near the ground and was issued in 50 ft. by 6 ft. rolls for a variety of purposes. Towards the end of the war, when night bombing became very persistent, scrim was used to cover aeroplane hangars (white or light-coloured only being very strongly-coloured), until covered became the normal equipment of a hangar.

**Colouration.**—In these three types four standard colourations were adopted, suited respectively to areas where the predominant cover was:—all vegetation, earth, partly earth vegetation, partly vegetation, partly vegetation and mostly earth. Both the scrim centres and the borders of strips were coloured in this way.

**Observation Posts, etc.**—A system of observation posts was not possible for obvious reasons, but the principle was applied to the bullet-proof interiors and other component parts. They were classified as: observer trees, parapet trees, parapets (sandbag or earth), portable O.P.'s. In addition there were many
special situations provided for. Other standardized articles were: dummy attack figures, dummy heads, snipers’ suits and portable covers for machine-guns—these last-named reversible squares of scrim 8 ft. by 8 ft., green on one side, brown on the other; made very light and portable, they were in use in the U-Boat War.

Manufacture.—Although a description of the methods of production is beyond the scope of this article, discussion of the principles and practice of camouflage would not be complete without some reference to the important part played by materials, particularly canvas and paint.

Canvas is not an ideal material, being very susceptible to damage by weather, but it is easy to manipulate and is cheap. From the point of view of appearance, it is inferior to wool, which, however, suffers from the hitherto insuperable disadvantage of inflammability. “Water” paints were generally employed for canvas for the reason that oil paints, which are more durable, are too inflammable, even to the extent of spontaneous combustion. This latter disadvantage was the cause of disastrous fires where rolls of painted canvas were stored. Green dye proved too fugitive, but brown dyes proved satisfactory. Generally speaking, canvas and paint do not adequately fulfill the conditions of lightness and durability.

III. NAVAL CAMOUFLAGE

The painting of vessels of war with a view to reducing their visibility and so adding to their fighting value is by no means a modern development. The Romans are known to have painted their galleys; Schneider, a certain kind of paint was used viz. purple, violet, two kinds of white, and green for pirates in order that their resemblance to the colour of the waves might make them less conspicuous.”

Camouflage on various lines but with the inevitable idea of reducing visibility had been attempted in the British navy for many years before the World War. None of these schemes had met with any success, and each in turn had been abandoned after futile trials. The two factors which led to this abandonment were first the failure to realize that anything in the nature of invisibility at sea is possible of attainment, and secondly the inability of the proposers of these schemes to provide definite instruction in the practical nature by which vessels could be painted with some degree of consistency.

The Board of Admiralty eventually adopted a partial form of camouflage by painting all vessels a light grey as opposed to the black hulls and light upper works previously in force. But even this simplest form of all protective measures was somewhat haphazard in application, since the individual vessels of a squadron varied considerably in colour, ranging from a light bluish grey to a dark slate according to the ideas of the commander.

It was not until 1917, during the height of the submarine peril, that the scheme of standardized dazzle-burning in yellow and purple, based on scientific lines was put forward and officially adopted by the British authorities. This scheme embodied entirely new ideas on sea camouflage, and was rescued from the early disease which had attended all its predecessors by the fact that the proposer was able to supply designs to scale in large numbers, all bearing out a central idea. It was called for distinction’s sake in official documents “Dazzle Painting.” The sole object of dazzle painting was so to distort the normal appearance of a vessel that her actual course became a matter of doubt in the mind of a submarine officer, the estimation of a vessel’s true course being the prime factor required to ensure successful attack.

Dazzle painting was intended primarily for application to merchant ships. These vessels were in far greater need of protection than warships owing to their slow speed and vulnerability and also from the fact that the enemy were making a concerted attack on England’s supplies of food and materials essential to the conduct of the World War.

Warships as a rule possessed high speed and were moreover protected by destroyers, a type of vessel which while being the most deadly opponent of the submarine was comparatively immune from attack. A certain number of war-vessels were however dazzle-painted. These were chiefly ships engaged on convoy work, although a certain number detailed for special duties such as mine-laying and patrol service found this special form of protection of valuable assistance.

At first sight it would appear impossible to treat a vessel with paint in such a way that an experienced seaman could be deceived. In the actual course of events, however, it proved possible. A large range of colours was used to achieve the end in view. Experience showed that this could be attained by a much smaller number, and towards the end of the war the principal colours in use were black, white, and blue, these being employed in varying intensity. Another factor was added to the application of dazzle. To secure uniformity and consistency in application of large merchant ships, dazzle was also added. The vessels were specially liable to attack, being at sea for long periods in submarine-infested zones and constantly under slow speed or altogether stopped for boarding purposes.

On the introduction of the scheme a considerable volume of maritime opinion was directed against it from lack of a proper grasp of its objects and because it appeared to render a vessel more conspicuous than was the case when painted grey. In point of fact at the date of the submission of the scheme the proponent, who was on patrol duty in the channel area, had painted the vessel black from water-line to truck. The opposition, however, rapidly disappeared as soon as the objects of the scheme were thoroughly grasped and the rapidly increasing numbers enabled seamen to judge for themselves the difficulties of accurately estimating the accurate courses of dazzle-painted ships met with at sea.

The organization for producing designs in great variety and arranging for the rapid application of the designs to large numbers of vessels of great diversity of types was as follows:—

The mercantile marine was divided into 57 classes of characteristic types. One or two types to each group had in fact a small wooden model was made to scale and on this model a design was painted in wash colours. It was then carefully studied in a prepared theatre through a submarine periscope with a view to obtaining the maximum distortion. Behind the model were placed the sky backgrounds, the conditions of an average day at sea being obtained as nearly as possible. The model was slowly revolved on a turntable and observed from every point of view, any necessary alterations and additions being made until the distortion became such that an independent observer found it a matter of considerable difficulty to judge its orientation.

The model was then handed to a trained plan-maker who transferred the design in colour to a 1:16 in. scale plan on white paper showing port and starboard side (see Plate I). Each colour on the plan was numbered to conform to the official colour charts, which gave a complete range of all colours used in dazzle painting (see Plate II). It was necessary to fill in the new numbers on the model. The number of the ships and the names of the contractors engaged were entered on the design. When all the information had been entered, the design was returned to the local painting contractors, whose work was done in accordance with the instructions given and who were responsible for the final surface."
similar department in Paris. The U.S. Navy Department asked that an officer might be sent to Washington; shortly after this, a dozen. Dailmopier was called on to survey commercial waters of the British. The Belgian Government were engaged in surveying the two merchant vessels to be dealt with directly in the British government.

Complete sets of plans were forwarded to Italy and Japan. All U.S. destroyers and other patrol vessels in European waters were painted from plans supplied from the British government.

The number of vessels saved by this device can never be definitely ascertained as it cannot be known how many attacks were broken off by enemy submarines owing to a wrong position having been taken up as a result of inaccurate estimation of the vessel's course due to the daze painting. But the rapid expansion to all Allied merchant shipping showed that the authorities were satisfied that it played a great part.

Approximately 4000 merchant ships were painted and upwards of 400 war ships engaged principally in convoy and patrol duties were also painted. The total cost of painting amounted to some £2,500,000.

CAMPBELL, BEATRICE STELLA [MRS. PATRICK CAMPBELL] (1865-1933), English actress (see §327), appeared at the Haymarket theatre, London, in Lady Patricia in 1911, and later in the same year at the St. James's theatre in Bella Donna. She also appeared in Mr. Shaw's Pygmalion at Majestie's theatre in 1914, and Leonora in Barrie's The Adored One at the Duke of York's theatre in 1913. In 1914 she married Mr. George Cornwallis-West. In 1917 she appeared in B. Veiller's American melodrama, The Thirteenth Chair, at the Duke of York's theatre, London, and in Nov. 1920 she played Lady Macbeth in Mr. James K. Hackett's production of Macbeth at the Aldwych. Her daughter, Stella Campbell, also became an actress.

CAMPBELL, SIR FRANCIS J. (1832-1914), British educator, was born near Winchester, Tenn., U.S.A., Oct. 9 1832. Having been blinded from the age of three, he was educated at the school for the blind at Nashville, Tenn., and later at the university of Tennessee. He also set himself to learn music, and went to the conservatories of Leipzig and Berlin. In 1872 he became principal of the Royal Normal College and Academy for the Blind at Norwood near London, which he, with the 1st Duke of Westminster and other philanthropists, had helped to establish. He retired in 1912. Amongst his recreations was Alpine climbing, and in 1885 he ascended Mont Blanc. He died at Norwood June 30 1914.

CAMPBELL, REGINALD JOHN (1867-1935), British divine (see §126), retired in 1915 from his ministry at the City Temple and in 1916 was ordained a clergyman of the Church of England. He became an hon. chaplain to the Bishop of Birmingham, and in 1917 was appointed vicar of Christ Church, Westminster.

CAMPBELL—CANADA

The water area given is exclusive of Hudson Bay. Ungava Bay, the Bay of Fundy, the Great Lakes, and all other tidal waters except the part of the St. Lawrence between Pointe-des-Monts and the foot of Lake St. Peter in Quebec.

The population in 1921 was fairly strong movement to unite Nova Scotia, New Brunswick and Prince Edward Island under a single government to be known under the old name of Acadia.

Population.—The growth of pop. is shown by the following figures: 1871, 3,485; 1881, 3,205,152; 1891, 3,760,315; 1911, 7,206,643. The pop. in 1921 was estimated at between 8 and 9 millions. The rate of increase of pop. greatly increased after 1896 on account of immigration from Great Britain, Canada, the United States and parts of central Europe. There are 10 main settlements in Ontario and Nova Scotia, while Russians, Galicians, Polish and Russian Jews and Scandinavians have emigrated in large numbers to the western provinces and territories.

Immigration.—Table II. shows the immigrants entering the country for the fiscal years 1911 to 1921 inclusive.

</table>

During 1911-21 18% British, 26% American and 29% of immigrants from other countries entered Canada. These figures do not account for the large number of farmers and farm labourers of the immigrant class who settled in all parts of the Dominion without homesteading. The number of French immigrants during these years was 31,913 and of Japanese 7,105.

Municipal Statistics.—Table III. gives the statistics of cities and towns of over 5,000 and over, showing population, total assessed value of the taxable property, area, etc. for the year 1910.

Agriculture.—The value of agricultural production in the Dominion, including live stock in hand, was in 1918 about $2,360,000,000, or nearly twice the value of the production of manufactures and over 12 times the value of mineral production in the same year. It was estimated by the Department of the Interior that in 1921 there were still 200,000,000 acres of vacant land in the Middle West available for at least susceptible to some form of agriculture.

The only item of agricultural production in which in 40 years up to 1918 there was shown a decrease was the number of sheep (2,365,359 in 1917; 2,355,995 in 1917). It is difficult to account for this, except for the fact that the wool production of Canada is low, and sheep have always been in Canada what a commercial man would call a sideline. Canada, however, is especially well adapted for sheep and goat raising and breeding. The great advantage of sheep not only in the West but in the older provinces, that could be used for the purpose without impeding on the other more fertile lands. In portions of Ontario, Nova Scotia and New Brunswick there is much cleared and partly and other apparent labour to waste and might be devoted to sheep culture. In the Middle West and in British Columbia there are approximately 50,000,000 acres suitable for sheep and goat culture. There are no long droughts, as in Australia, and there is comparative immunity from disease; in the past the great enemies of sheep in Canada have been dogs and wild animals.

Factory cheese (194,901,368 lb. in 1917; 220,833,826 lb. in 1908) also followed a decline in production, on account of the greater demand for creamery butter and the more profitable outlet for milk and cream in the urban centres. So great is this latter demand that the whole of N. America is affected by it. In live stock—particularly dairy and beef cattle (7,092,200 in 1919; 7,390,200 in 1917) and swine (3,619,382 in 1917; 3,666,083 in 1917)—lies Canada's greatest agricultural prospect, because cattle give to the soil the greatest return in fertility. They are the necessary link in the rotation of crops; and Canada, with her vast area, her abundant pasture and adaptability for growing fodder crops, and her advantageous position in respect of foreign markets for dairy products and meats, is in the position of great strength. Despite the number of motor cars, the number of horses in Canada has increased (3,412,749 in 1917; 3,000,000 in 1909) and there is still a good future for selected breeds of draught, riding and race horses.

In view of the labour situation, in which farmers are practically deprived of outside help, agriculture in Canada, as elsewhere in America, resolves itself into self-help, and therefore has become a question of small mixed-farming, limited to special lines in which machinery may be utilized and on which apparent labour is required. In the Maritime Provinces and Ontario farms are practically dunned.

Principal Cities.


According to official figures in 1921, the capital invested in the Canadian lumber industry was $231,205,247; the value of products was $261,551,900; the production of pulp and paper in 1919 was $261,551,900; the production of paper having a value of $41,362,913 and of newsprint, $11,023,437.

Wild Animal Life.—The establishment by the Government of parks and game and forest reserves or “sanctuaries” is of much importance in connexion with the conservation of the furry animals, the “game” of Canada. There is in Ontario alone, 79,229,809 acres of Canadian fur of all kinds rose from $5,599,476 in 1914 to $13,737,621 in 1919. The constant expansion of the settled area has caused some kinds of fur-bearers to retreat farther into the woods; the clearing of the land has become so general that millions of fur-bearing animals have destroyed their haunts and exposed them to their enemies; and the draining of swampy areas has destroyed the homes of the muskrat. Mayor; it is likely, however, that the marten never seem to survive long near man’s habitations. Even the fox, which appears to increase near human settlements, will decrease if the forests are wholly removed or burned. The official policy is to inject new social life, so to speak, into the communities of wild animals, protecting what were left by the fur-hunters, the ruthless sportsmen and the Indians, and preserving and protecting them under more favorable conditions for future generations. The parks reserves for wild animals aggregate 10,000,000 sq. m. in extent.

Other undertakings on a more extensive scale will probably result from Government investigation and action. The woodland buffalo or woodland bison was, so far as is known, the only large land mammal that could be probably improve the latter. The millions of caribou in the Yukon and adjacent territory and the musk-ox of the barren lands are likely to be nationalized and dealt with like other concessions for the benefit of the Indian. If the fur trade is an alternative, then the fur trade would probably produce a better variety than either. The mountain sheep of British Columbia has a future assured, and several thousand in existence in isolated blocks in British Columbia and Alberta may become herds. Animals of certain genera become tame when hunted; this is also true of wild geese, ducks, swans and other water birds. Game has never been carried on the West Coast. There are further possibilities of dealing with bear, beaver, mink, marten and other animals according to their habits and habitat.

Fur-farming, one of the new industries of Canada, is only a new form of Canada “exploitation.” In the Pacific Northwest, there is raising and taking and fur-trading. The difference is that wild animals are now bred and reared in captivity for fur and for breeding stock. In Prince Edward Island, fox-farming has made some fortunes, and the sales are included in the agricultural returns of the province; the industry has been extended to New Brunswick, Quebec and British Columbia.

Fisheries.—Commenting on fisheries, an official report points out that; “The fertility of Canadian waters is indicated by the fact that the entire catch of salmon, lobster, herring, mackerel and surdines, nearly all the haddock, and many of the cod, hake, and pollack landed are taken within 10 or 12 m. from shore.” The commercial fishery to-day is a result of these conditions, but the new conditions of the commercial fisheries are not including lesser bays and indentations, measures over 5,000 m., whilst the sea areas to which this forms the natural basin embrace: the Great Lakes, the St. Lawrence, the Seaway, the North Atlantic, and the seas of the world, ten times that size, and other oceans aggregating not less than 200,000,000 sq. m.; a total of over 1,000,000 of the fishing grounds of the N. Atlantic. In addition there are 15,000,000 of inshore waters opposite the Canadian borders, and in pane, in large areas, the province of the herring grounds of Canada. Hudson Bay, with a shore 6,000 m. in length, is larger than the Mediterranean; the Pacific coast of the Dominion measures over 7,000 m. long, and is exceptionally well sheltered for fishermen; and throughout the interior a series of lakes which together cover 200,000 sq. m., or more than one-half the fresh water of the globe, Canada’s share of the Great Lakes of the St. Lawrence basin covering 72,790 sq. miles.

The fisheries of the Atlantic are divided into deep-sea and inshore or coastal fisheries. Deep-sea fishing is pursued in vessels of from 40 to 100 tons, carrying crews of from 12 to 20 men. The method is to fish with long lines of 800 fathoms or more, and to keep the lines on the bottom for hours. The fleet of Canadian vessels engaged in the haddock, hake, pollock and halibut. The inshore fishery is carried on in small boats, usually motor-driven, and in a class of small vessels with crews of from 10 to 15 men.

Apart from the five fisheries departments and those, and along with the department of Ottawa, are endeavouring to conserve and develop the fisheries resources to their utmost extent by means of hatching, culture and research. It is estimated that between 1,000,000,000 and 1,500,000,000 of fish fry of one kind and another are annually planted in various waters by a large number of hatcheries. Long efforts have succeeded in bringing the salmon hatcheries to a higher stage of efficiency and regularity; and the Research Council has taken up the question of utilizing waste. There are over 300,000 tons of fish waste in Canada each year, of which 100,000 tons could be utilized to produce fertilizers and protein foods for cattle, hogs and poultry.

The salmon (product valued at $15,959,970 in 1920) is obtained almost exclusively on the Pacific Coast. Those taken in Quebec, New Brunswick and Nova Scotia resemble those of Great Britain and are regarded as superior for table use. Only one salmon in British Columbia, the steelhead, may be said to be closely allied to the Pacific salmon. Much of the salmon fishing ($6,270,171 in 1920) is largely prosecuted on the Atlantic coast and is one of the most useful and valuable of the eastern fisheries. The herring fishing ($3,337,738 in 1920) is carried on quite extensively on the Atlantic coast, and the haddock and cod fisheries in the waters of the Atlantic sea are becoming popular throughout central Canada. Haddock, hake and pollack are extensively taken in the Atlantic deep-sea fishing. Haddock fishing ($4,535,188 in 1920) was carried on to a great extent, but its principal headquarters are now at Prince Rupert. Fishing is herring fishing on the north-west coast and deep-sea fishermen are turning to kinds hitherto agg.

There is also a fishery in British Columbia for the removal of salmon and herring in the waters of the Pacific and the Indian Ocean, but the fisheries for the herring and salmon are now the most important. Much of the salmon and herring are used on the Pacific Coast, and most of the herring is shipped to Japan. The fisheries for the herring and salmon are now the most important. Much of the salmon and herring are used on the Pacific Coast, and most of the herring is shipped to Japan. The fisheries for the herring and salmon are now the most important. Much of the salmon and herring are used on the Pacific Coast, and most of the herring is shipped to Japan.

Sturgeon, which are both abundant and of considerable size, are found in the waters of the Pacific coast, and are used for food in Japan. The fisheries for sturgeon and for salmon are now the most important. Much of the salmon and herring are used on the Pacific Coast, and most of the herring is shipped to Japan. production when the Yukon came suddenly into prominence in 1897 as a new source of supply. Then Porcupine loomed on the horizon as a rich producer, and Ontario as a consequence in 1920 yielded half the total production, viz., $11,655,759. Manitoba has become a small producer of copper, gold being derived from the newly opened mining districts of the Pas. Nova Scotia and Quebec have been small but steady producers for years. There are inviting prospects for gold over large areas of northern Ontario, northern Quebec, northern Manitoba and Saskatchewan, and throughout British Columbia.

In 1890 and 1891 rich discoveries in silver were made in the Slocan district of British Columbia, the silver being found associated with lead in galena ores. The province has since been a large producer both of silver and lead, and now also of zinc, which is usually a concomitant of lead and silver in the Kootenay silver-lead ores. In 1903, however, deposits were discovered in northern Ontario about 12 miles east of Sudbury, in what is now known as Cobalt, which proved to be marvellously rich in silver. So much so that in 1911 the production there was over $30,000,000. The Thunder Bay region west of Port Arthur yielded silver as far back as 1846, and attention is now being directed to the old mining areas.

Despite the fact that for a number of years Government boundaries were paid on lead and zinc mined and smelted in Canada, the output of these metals did not increase, except during the war, when the demand for lead eliminated the boundaries automatically, and new processes made the extraction of zinc practicable. Nearly all the production in both metals is in British Columbia, although Quebec and Manitoba also contribute. There are deposits in several parts of Ontario, in the Gaspe Peninsula, Quebec, and in northern New Brunswick.

Copper is widely distributed throughout Canada and where found in large quantities is a source of wealth. Of natural copper, Canada in 1917, British Columbia contributed well over one-half, Ontario came next with about 43,000,000 lb., drawn mainly from the Sudbury district, and Quebec third with over 5,000,000 lb. The new discoveries, in British Columbia and the Yukon, have added nearly 30,000,000 lb. Depending upon the future demands for copper, the possibilities of Canada in British Columbia, in the Yukon, in the extreme north, in northern Ontario, and in Quebec, including Ungava, are without doubt very great.

Sudbury district in Ontario, which is characterized by the richness and diversity of its minerals, is the chief source of nickel. Very large quantities of nickel are consumed, and the country's con-{

ber's capital has been built on the results of these investments representing between $15,000,000 and $20,000,000. New Caledonia, lying about 600 mi. east of Australia, is the only serious competitor to Canada in nickel production. Among the other nickel-producing areas are Copper Harbour, Ontario, and the Nickel Range, Minnesota, for which the country is an important producer, and Canada, and which is from year to year increasing. As nickel has been represented in the table, the recorded power available throughout the Dominion is 18,255,000 H.P. The water-power available under estimated flow for maximum development that is, dependable for at least six months in the year, is 32,076,000 H.P. There are installed throughout the Dominion water-wheels and turbines to the extent of 2,477,000 H.P. An analysis of the water-power resources of Canada shows that in terms of generating capacity installation 30% greater than the six-month flow maximum power.

Applying this, the figures indicate that the water-power resources recorded in 1920 permit of a turbine installation of 41,700,000 H.P. In other words, if the installations represented in the table are increased from 6.5 to 8.5% of the recorded water-power resources. Though industrial and commercial conditions were still far from normal, in 1920 there was installed capacity of 50,000,000 H.P. on the 6.5% basis. This figure, however, includes only initial installation, not ultimate designed capacity. Should the rate of water-wheel installation during the next 15 years be continued, it was estimated in 1920 that Canada would have 5,500,000 H.P. developed water-power.

### Railways

The Canadian railways in 1921 had become consolidated into two great systems, the Canadian Pacific and the National Canadian, neither of which was until 1919 the subject of Government ownership. There were some 20,000 of which were under Government control. The capitalization of railways in operation at the end of 1918 was $1,998,880,494, and the aggregate earnings for the year were $330,220,135. There are six canal systems under the control of the Dominion Government. As a result of the war the railway situation had changed very materially from one of optimism in 1912-3 to one of almost painful severity in 1919. This arose from the inability of the Canadian Northern on the one hand to sell its bonds to complete its transcontinental system, and of the Grand Trunk, on the other, to meet its interest and other obligations in connection with the Grand Trunk Pacific, and to cope with the increased workings brought about by the war conditions. Repeated appeals were made to Parliament for further financial aid. A Royal Commission, consisting of three eminent railway experts, was appointed to inquire into the entire railway situation of Canada, and an exhaustive investigation there was issued which was known as the Acworth-Drayton (majority) report, practically recommending that the Canadian Northern should be taken over by the Dominion Government, with its affiliated railway systems, under operation under a council of a board of directors.

A system which would apply if and when the Grand Trunk and Grand Trunk Pacific were taken over was also recommended. The nationalization of the Canadian Pacific was not recommended. The recommendations of the majority report of this Commission became the policy of the Government, and on June 30, 1918 the Canadian National ceased to be an independent entity. In the legislation of 1917 authorizing the acquisition of other railways, provision was made for the management of the balance of capital stock, amounting to $60,000,000, not in the hands of the Government, its value to be determined by arbitration. This was fixed at $10,800,000, and the transfer was made. The system is now operated by a board of directors, of which in 1921 Mr. D. B. Hanna was president. The Grand Trunk, meanwhile, desired to be relieved of its obligations in connection with the Grand Trunk Pacific. In the spring of 1918 the Grand Trunk Pacific notified the Government that it would not be possible for the company to continue its operations when the balance of money in hand had been exhausted (about March 10), and authority was asked for in accordance with the provisions of the War Measures Act to appoint a receiver for the company, Parliament having confirmed this action. In the fall session of Parliament a bill was introduced authorizing the arbitration of all the capital stock of the Grand Trunk system, the Government, however, guaranteeing 4% dividends as well as interest upon present debenture stock outstanding. The value of the preference and all debenture stock in the entire capital stock of $2,500,000 was to be determined by a board of three arbitrators, and a committee of management was to be formed—two members to be appointed by the Government, two by the Grand Trunk and a fifth by the four so appointed—to ensure as far as possible the operation of the railway in harmony with the Canadian National system. This went into effect.

Not without some difficulty the consent of the Grand Trunk shareholders was obtained. Sir Thomas White, late Minister of Finance, acted for the Government; Mr. W. H. Taft, ex-President, and later Chief Justice of the Supreme Court, of the United States, acted for the Grand Trunk; Mr. Justice Warren H. Stanley, Ottawa, acted for the Grand Trunk. On December 1912 their awards were published. The two Canadian arbitrators held that "no value" attached to the common and preference stocks, though it would be for the Government to decide whether, it was the policy of Government ownership. In a dissenting judgment, Mr. Taft held that the "value" was higher than the maximum provided in the Act. Under further consideration that the railways might be acquired by the Government would eventually be amalgamated into one large system, operated by a National Board of Directorate. During the several sessions in which the legislation referred to was brought about very keen and protracted discussion, largely by the principle of Government ownership, took place. The opposition was greatly emphasized by announcements of increasing deficits in the operation of the National system in 1915 and 1916, the National receiving $86,000,000. Five steam railways paid dividends during 1919: the Canadian Pacific $29,277,277, and four others in the aggregate $76,000. The average number of miles operated in March 1921 was 38,076,30. The Canadian Pacific and the National railways (including the Grand Trunk) operated over 85% of the total single-track mileage. The rail constructions of Canada included 17,000 miles of railway (under jurisdiction Department of Railways) 4,504 m.; Canadian National (under board of directors) 9,757 m.; Grand Trunk Pacific (under receiver) 2,807 m.; Grand Trunk 3,571. The mileage of independent railways was: Algoma Central 147; Algoma Eastern 89; Quebec Central 277; Victoria, Vancouver & Eastern (Greater North) 269; Keno City 155; Marquette and Huron Southern (Michigan Central) 380; Dominion Atlantic (Canadian Pacific) 274; Great Waterways (Province of Alberta) 113; Edmonton, Dunvegan & British Columbia (Alberta Government) 212.

The total capitalization of steam railways on Jan. 1, 1921 was $2,036,135,606, of which $586,806,850 belonged to the Canadian Pacific, $451,685,966 to the Grand Trunk, $417,924,887 to the Canadian National, $153,764,376 to the Canadian Government railways (including National Transcontinental & Hudson Bay Railway), and $216,512,340 to Grand Trunk Pacific and branch lines. Salaries and wages amounted to $323,325,074 and the number of employees to 17,527. There was a total corporate loss on operation for the year of $15,097,747. The track mileage of electric railways amounted to 2,400 miles. Capital stocks on the railways and funded debt of the amount of $713,041,340, and $20,211,576 wages were paid to 169,430 employees.

### Canals

The river St. Lawrence, with the canals established on its course above Montreal, and the lakes Ontario, Erie, St. Clair, Huron, and Michigan, and Superior, and the water communication extending from Montreal to Port Arthur, at the head of Lake Superior, a distance of 1,214 miles. The distance to Duluth is 1,330 m. and to Chicago 1,422 m. This system contains a total of 54 locks, through which the St. Lawrence consisting of river and lake waterways. The minimum depth of water on this route is 14 feet. The canal approaches and the channels of the lakes and rivers are marked by beacons, with lighted-buoys, admitting of navigation by night as well as by day. Theachine, Soulange, Cornwall, Welland and Sault Ste. Marie canals are lighted by electricity, and are electrically operated. It is the duty of the agents of the Government and the National Waterways Commission, it may be noted that the St. Lawrence river is the greatest waterway in the world and the oldest in use in the New World. There are no floods in the St. Lawrence as compared with which all others can be considered in the continent. The difference between maximum and minimum volume is 1-19 ft.; as compared with the Ohio, 28.22 ft.; the Missouri, 29 ft.; and the Mississippi, 102.9 ft. The lakes act as settling basins and no silt is carried down to be deposited in the river. Hence when a channel is dredged, the dredging process does not require to be continuous as in most other rivers. Between Montreal and Quebec the river was deepened some years ago to 30 ft. and work is in progress to increase it to 35 ft., so that the largest ocean vessels may dock at Montreal. Canals have been built at various times to overcome the rapid lakes between Lake Ontario and Montreal, and six of these are still in force. In 1483 the Gow's Canal, 144 ft. wide, 146 ft., and in depth from 14 to 15 ft., are in existence. To make the waterways scheme feasible, this section of the river would have to be so deepened. An important lift canal, the Sault Ste. Marie Canal, which was being rebuilt between Port Colborne on Lake Erie and Port Weller on Lake Ontario in 1921, will be 80 ft. wide and 30 ft. deep. It will be able to accommodate ocean vessels and will form the greatest waterway connecting the east coast of Canada, if that should be decided upon. Locks on the "Soo" Canal have opened Lake Superior to the world, and improvements from Lake Superior to Detroit have been made to render navigation on the proposed scale practicable. Incidently, the scheme involves the development of water-power estimated at 2,000,000 H.P.

Of the minor systems, the Murray, Trent, Rideau and Ottawa river canals may be mentioned in passing to the north-west route. In operation, however, these canals serve a distinct purpose of a more local nature, isolated from the system of through navigation, the navigation of the Richelieu river, from its junction at Montreal with the St. Lawrence near the site of the city, and the Champlain Canal, while to the extreme east the St. Peter's Canal provides communication between St. Peter's Bay, in Cape Breton, Nova Scotia and with the Great lakes. It crosses an isthmus half a mile in width, and gives accessibility to the St. Lawrence by way of the Richelieu river. A ship canal was in course of construction from Port Dalhousie to Port Colborne, connecting Lake Ontario and Lake Erie; work was suspended.

### Roads

At the end of 1920 about 250,000 m. of public highways in Canada were open and serviceable for ordinary travel during the
summarize season. The roads are graded and crowned, with suitable drainage, culverts and bridges. The mileage in the nine provinces is fairly evenly distributed, in accordance with area and population. In five of the ten roads have been made and maintained at the expense of the Provincial Government and in the cases in which it has been borne by the municipalities and Provincial Governments in cooperation. During recent years there has been a very large increase in the number of automobiles using the roads, and for this reason the cost of the road work on main roads is based on improved high standards, with hard finished surfaces consisting of gravel and stone macadam, cement concrete, asphaltic surfacing. In every instance asphaltic or some other continuous surfacing is provided. To assist the boards of municipalities and municipalities in this respect, the Dominion has passed legislation whereby it is empowered to furnish aid to the extent of 40% of the cost of the improvement of such main highways. The amount devoted to this purpose is $20,000,000, to be spread over a period of five years, the aid to be given, in any case, being 40%, of the amount which is the actual, necessary and reasonable cost of the construction or improvement of the such highway. The sums attached to the grant are that any construction or improvement shall be in accordance with the terms of an agreement to be made by the Minister of Railways and Canals of Canada with the Provinces, and that the agreement shall contain provisions as to location, cost, description, specifications, etc., as are necessary to protect the public interest, all expenditure being by tender and contract.

Finance.—The Canadian Bank Act contains no specific provisions as to the amount of gold to be held either against note circulation or the general business of the bank. It requires, however, that 30% of what the Bank of Canada finds expedient in the public interest, to be held as a cash deposit. A second provision the Minister of Finance to arrange for the delivery of Dominion notes to any bank in exchange for specie. Thus the gold reserve against Dominion notes, to the extent of the amount which is held by the Minister of Finance for banking operations, the Dominion Government being the custodian of the gold for the banks. The other gold element in bank reserves is specie in hand. The sum of the two represents the gold basis of the Canadian banking system. In addition to the reserves above mentioned the Canadian banks hold three other kinds of assets which are regarded as reserves, being funds more or less immediately available for the liquidation of liabilities. In 1906 there were 1,745 chartered banks with branches numbering 1,505. Since that time there has been very considerable consolidation. In 1921 the number of banks was 18, but the number of branches had more than doubled, being now 4,584. The above provisions were intended to furnish to the Minister of Finance detailed monthly statements which are published in the official gazette. Clearing-houses have been established in the chief commercial centres and cover the operations of Canada as a whole. On Dec. 31, 1919 the paid-up capital of the banks was $119,199,441, with a note circulation of $22,486,734 and total deposits amounting to $1,841,478,895. The total liabilities at that time amounted to $2,925,812,968 and total assets $2,920,568,118. At the end of 1920 the total amount to the credit of depositors in the Post Office and Dominion Government savings banks was $53,657,018. The amount on deposit in the savings departments of chartered banks amounted to $1,754,265.

The Dominion revenue and expenditure in 1914-1920 are shown in Table XI. Up to March 31, 1920 the total outlay for the war was approximately $1,670,466,312. This amount includes all expenditures on behalf of Britain and France, and is also inclusive of the upkeep of the troops overseas.

Table XI.—Revenue and Expenditure: March 31, 1914—March 31, 1920.

The net debt of Canada, which before the war stood at about $3,200,000,000 on March 31, 1910 was reduced to less than $2,000,000,000 on March 31, 1920. This was almost entirely attributable to war expenditure. Details of the domestic loans issued by the Canadian Government since the commencement of the war are given in Table XII. The net debt of Canada was thus reduced from $3,200,000,000 to $1,200,000,000, as well as a considerable amount of debenture stock, were sold. Loans were also floated in New York for: (1915) $874,000,000; (1916) $75,000,000, (1919) $15,000,000, (1919) $50,000,000. From the outbreak of war to Nov. 30 1918 Canada established huge credits on behalf of the Imperial Government. Through these advances Great Britain and the Allies could, if they wished, lend the sum of $200,000,000 for the purchase of munitions and wheat. This was made possible by the large savings deposits in Canadian banks, which from Aug. 1914 to Oct. 31, 1918, despite the withdrawals for subscription to war loans, increased by $417,815,476.

Soon after the outbreak of war taxes were placed on luxuries and gradually increased. Higher duties were levied on the export of liquor, tobacco, and many other articles, and certain goods, such as the tax on transportation tickets, telegrams, money orders, cheques, letters, patent medicine, etc. In 1914 an increase of 7½% ad valorem on the general tariff and 5% ad valorem to the British preferential tariff was introduced. In 1915 the tax on certain work-stuff foods, coal, harvesting machinery, fishery, equipment, etc. In 1918 a special customs duty was imposed on tea and coffee and the excise on tobacco was increased. In addition, various other taxes were imposed on the sale of goods, the use of certain utilities, the consumption of various articles, including automobiles, jewelry, etc. Under the Business Profits War-Tax Act the Government at one time, in the case of all businesses having a capital of $50,000, imposed a tax of 5% of the profits over 15% and not exceeding 20% and 75% of the profits beyond 20%. In the case of businesses having a capital of $25,000 or less the Government paid 10% of the profits in excess of 10% on the capital employed. Companies employing capital of less than $25,000 were exempted, with the exception of those dealing in munitions or war supplies.

The Dominion income-tax, which came into effect in the year 1918-19, is in some respects higher than that in force in the United States. The scale provides for the exemption of incomes in the case of unmarried persons with an income of $1,500 and under, and in the case of married persons with an income of $2,000 and under. There is also provision for the exemption of $200 for each child.

Defence.—Under the Militia Act of 1904 the command in chief of the militia is vested in the King, by whom, or by the Governor-General in Council, as his representative. The Act further provides for the appointment of a Minister of Militia and Defence, charged with the administration of militia affairs, and of a deputy minister, in the case of the Government of Quebec. These, in addition to the Minister and deputy minister, four military members—the chief of the general staff, the adjutant-general, the quartermaster-general, and the major-general of the ordnance. There is also an inspector-general, whose duty it is to inspect, report to the minister on their readiness for war, but who has no seat in council. The Canadian land forces are divided into the active militia and the reserve militia. The active militia consists of a permanent and a non-permanent force, the latter divided into city and rural corps. Service in the active militia is voluntary and for three years, but the Government has the power to apply compulsion should the necessity arise. The permanent force comprises, as its principal arm, the service of the Permanent Force or the militia. The non-permanent active militia undergoes an annual period of training, which varies from 12 to 16 days according to the arms of the service and the location of the corps, i.e., whether they are in the active militia or the local militia. The authorized Limited Establishment for the permanent force was approximately 4,000 in 1921. The nonpermanent active militia is comprised of such corps as from time to time are endowed, and is a body of volunteers composed of a number of permanently embodied units. It provides personnel for the various schools of military instruction and garrisons for the territories, where a permanent element is necessary for defence, for the maintenance of camps, and the preservation of arms. The non-permanent active militia is maintained at an annual cost of $750,000, which varies from $750,000 to $1,000,000, depending on the number of volunteers in service. It trains officers on a continuous basis for the permanent force and for the remainder of the active
military, and a certain number of commissions in the British regular army are granted annually to its cadets.

Naval Service.—The department of the Naval Service of Canada consists of the Royal Canadian Naval Service, the Royal Canadian Navy, the Royal Canadian Marine, and for hydrographic surveys, tidal and current survey, radiotelegraph or wireless service and the Canadian Arctic Expedition. The naval service proper embraces one light cruiser, two torpedo destroyers and one minesweeper, and is aimed at defending the coast of British Columbia, and also embraces the Royal Naval College of Canada and the dockyard at Esquimalt and the dockyard at Halifax. The docks at Esquimalt are maintained at the expense of the Crown for the purpose of repair and overhaul of the ships of the fleet, as well as for the other services of the department. The principal functions of the department are thus: (a) to assist in the maritime defence of the Empire; (b) the maritime defence of Canada from attack from overseas; (c) the protection of Canadian fisheries; (d) the surveying of ocean beds, coast-lines, bays, rivers and lakes, and the preparation and distribution of charts, plans and sailing directions of the navigable waters; (e) the scientific investigation of tides and currents, and the prediction and determination of tide levels; (f) the administration of wireless telegraphy and telephony throughout the Dominion; (g) the completion of the Canadian Arctic Expedition.

History.—The political history of Canada in 1910-12 revolved around two great questions of administration, accomplished by the United States and Canadian naval policy in relation to the Empire. On July 18, 1911 Parliament reassembled after the Coronation adjournment, and on July 29 the Government of Sir Wilfrid Laurier, who had been Premier since 1896, decided to recommend the dissolution of Parliament and to submit their proposals for commercial reciprocity with the United States to the judgment of the Canadian people at a general election, which was fixed for Sept. 21. While the chief question before the electors was the Reciprocity Agreement, the question of Canada’s naval policy received much attention, especially in the province of Quebec. The result was a complete defeat for the government, and the Reciprocity party. What had been a Liberal majority of 43 was converted into a Conservative-Liberal and anti-Reciprocity majority of 49. Mr. Fielding and Mr. Paterson, who were responsible for the negotiations with the United States, were both defeated, together with Sir F. Borden and four other ministers. On Oct. 6 Sir Wilfrid Laurier and his administration resigned office. Sir Wilfrid Laurier retained his seat, however, and decided to remain at the head of his party, now in Opposition.

Mr. (later Sir) R. L. Borden (b. 1854), leader of the Conservative party, being the great question of administration, accomplished this task on Oct. 20, 1911, and the new Ministry was constituted as follows: R. L. Borden, Premier and President of the Privy Council; George Gulas Foster (b. 1847), Trade and Commerce; Robert Rogers (b. 1856), Interior; F. D. Monk (b. 1856), Public Works; Francis Cochrane (b. 1852), Railways and Canals; William T. White (b. 1866), Finance; Louis P. Pelletier (b. 1857), Postmaster-General; John D. Hazen (b. 1860), Marine and Fisheries and Naval Service; Charles J. Doherty (b. 1853), Justice; Samuel Hughes (b. 1853), Militia and Defence; William J. Roche (b. 1859), Secretary of State; Thomas W. Crothers (b. 1856), Labour; Wilfrid B. Nantel (b. 1857), Inland Revenue and Mines; John D. Reid (b. 1859), Customs; Martin Burrell (b. 1858), Agriculture; George H. Perley (b. 1857), Albert E. Kemp (b. 1858), and James A. Lougheed (b. 1854), members without portfolios. On Oct. 22, 1912 Mr. Monk resigned on the question of Mr. Borden’s naval policy and his portfolio was taken over by Mr. Rogers, Mr. W. J. Roche becoming Minister of the Interior in his place. The office of Secretary of State was filled by Mr. Louis Codere (b. 1865), the member for the Hochelaga division of Montreal. On Oct. 23, 1911 the Hon. Augustine Landry was appointed Secretary of the Senate, and on Nov. 15 Dr. T. S. Sproule was elected Speaker of the House of Commons.

The twentieth Parliament of the Dominion of Canada was opened on Nov. 15, 1911 by the new governor-general, the Duke of Connaught, in person. The address in reply to the speech from the throne was voted on Nov. 29, and on Dec. 7 Parliament adjourned over the Christmas recess until Jan. 10, 1912. On resuming, the main business was financial. On April 1, 1912 Parliament was prorogued.

When the new session opened on Nov. 21, 1912, it was known that the announcement of Mr. Borden’s naval programme would be the business of outstanding importance. The governor-general, in the speech from the throne, stated that his advisers having consulted that it would be the duty of Canada at this juncture to afford aid in strengthening the effective naval forces of the Empire; and on Dec. 5 the Premier announced an Emergency Contribution bill, leaving permanent policy for future consideration.

The Reciprocity Question.—Sir W. Laurier’s Government had been the most active for negotiations for Reciprocity with the United States in Jan. 1910, as the result of private discussions in the previous year. The terms of the proposed agreement were announced in the Canadian Parliament by Mr. W. S. Fielding, the Finance Minister in Sir W. Laurier’s Cabinet, on Jan. 26, 1911. It aimed at more free intercourse of products by removing duties on certain articles and reducing them in others.

Among those which were to enter free in each country, if of the growth, product or manufactures of the other, were live animals, poultry, wheat and other grain, vegetables, fruit, dairy products, honey, cottonseed oil and certain seeds, grass, garden, field and other seed, fish except those preserved in oil, certain fish oils, timber (not sawn), brass (not polished), rolled iron or steel sheets 1.4-gauge or thinner, galvanized, coated with zinc or tin, crucible cast steel, copper, iron, steel, entitled, wrought and cast iron, sheet iron, barbed wire fencing, coke (round), wire rods, wood pulp, and cream separators. Among the articles to be admitted into Canada from the United States and included by the agreement, the Canadian identical rates were the following: Fresh meats 11 cents per lb.; bacon and hams, not in tins or jars, 11 cents per lb.; meats dried and preserved 11 cents per lb.; canned meats and poultry 20%; lard, etc., 11 cents per lb.; barley, malt, potatoes, potatoes (except frozen), 11 cents per lb.; biscuit, wafers, cakes 25%; confectionery 32%; farm wages 22%; farm implements of various kinds 15%; portable engines with boilers and traction engines for farm purposes 20%; roofing slates 55 cents per 100 Ibs.; cutlery, plated or not 27%; clocks, watches, etc., 37%; automobiles 30%. Arrangements were made for special rates of duty on a moderate scale to cover a large number of other commodities.

The case presented for the adoption of this agreement was that reciprocal trade relations had been the policy of all parties in Canada for generations, that many efforts had been made to secure a treaty without success, and that Sir John Macdonald’s National Tariff policy (1879) contained a standing offer of reciprocity with the United States covering a large portion of the products included in the present agreement. The United States having approached Canada with fair offers, it was claimed that they should be fairly met, and that in making the arrangement the Government were realizing the desires which the Canadian people had expressed for half a century, and also that in promoting friendly relations with the neighbouring republic the best possible service to the Empire was being done. As Canada was seeking markets everywhere for her surplus products, subsidizing steamship lines, and sending out commercial agents, it would be absurd to refuse increased facilities at her very doors if they could be obtained by negotiation.

A demand was given to the expression fear that the imports from Great Britain would be seriously affected. It was pointed out that the greater part of the agreement dealt with natural products which did not come from Great Britain, and that the range of manufactures affected was small. It was further denied that there was any foundation for the assumption that the tariff rates agreed upon discriminated in favour of the United States and against Great Britain. The promoters of the agreement promised that in every case Great Britain would have the same rate or a lower one, and held that Canada’s right to deal with the British preference as she pleased remained untouched.

The negotiation to determine the ground that the arrangement had been entered into hastily without its effects being fully appreciated, and that the question should be referred to the people. Attention was drawn to the success which had attended the efforts to build up a nation and bind the country together from east to west, and it was contended that, as the arrangements proposed would primarily affect the question of transportation by promoting a tendency to make trade move north and south, the immense efforts which had been made would be sacrificed, and the markets which had been secured in Great
Britain abandoned. The action of the United States in approaching Canada with a desire to make such an agreement, after declining on so many occasions to consider the question when asked to do so by Canada, was looked upon with suspicion, and it was suggested that the balance of advantage would remain with the United States, the speeches of some of her most prominent public men being freely quoted in support of this view—notably one by Mr. Champ Clark in Congress, and another by President Taft himself. It was held that the impelling cause was the desire of the United States to have access to the abundant natural resources of Canada, her own reserves of wood, coal and other minerals, and much of her farm land, having shown signs of exhaustion. It was thought the better plan was to conserve Canadian resources for Canadian use. A further objection to the proposals was that, while they would change the whole current of Canadian industries, and it was necessary for the development, the new markets proposed would be so entirely unstable and insecure that, after having had the benefit of them for a few years, they might be withdrawn, causing a reverserto the position of 25 years earlier, and necessitating the rebuilding of home industries and re-making their reputation in markets which in the meantime had been entirely occupied by old competitors. Great importance was attached to the restriction on legislation which it was alleged this agreement would cause, as no trade agreement under it could obtain redress without the arrangement as a whole being upset. It was also urged that under it concessions in the tariff would have to be made, in accordance with existing treaties, to countries from which no equivalent advantages could be obtained; and it was declared that if this Reciprocity policy was pursued the ties of Empire would eventually be cut, for it would lead to complete commercial union and in the end the political domination of the United States, to which Canada would simply be an annexe.

The debates in connexion with the matter lasted for almost the remainder of the session; but on Feb. 22 1911, on the motion of Mr. F. D. Monk, the House adopted unanimously the following resolution: 'That the House, in the motion for going into Committee of Ways and Means: But, before resuming the discussion of the terms of the agreement concluded between the Government of Canada and the President of the United States, and with a view to dispel the feeling of unrest created in Canada by comments made in both countries as to the political consequence of the agreement, the House wishes to affirm emphatically its determination to preserve intact the bonds which unite Canada to the British Empire and the full liberty of Canada to control her fiscal policy and internal autonomy.'

A bill to give effect to this Reciprocity Agreement on the part of the United States was introduced in the American Congress on Jan. 29, and in due course passed there; and on July 29, 1911, it being enacted that its provisions should become operative as soon as the necessary counterpart legislation had been passed by the Canadian Parliament. Discussion continued in the Canadian House of Commons, but no progress was made towards the adoption of the proposals, and on July 29, 1911, the Government decided to recommend the dissolution of Parliament and to submit the matter to the judgment of the people at a general election. The defeat of the Government followed, the result being greatly influenced by the strong opposition to Reciprocity which was shown by such well-known Liberals as Mr. Clifford Sifton (b. 1861; formerly Minister of the Interior in the Laurier Cabinet), Mr. Lloyd Harris and Mr. Wm. German, and by the steps taken by a body of prominent Liberals of Toronto, assisted by Sir Edmund Walker, president of the Canadian Bank of Commerce.

Sir W. Laurier's Naval Policy.—An outcome of the Imperial Conference of 1906 had been the determination of the Canadian Government to establish a naval service; and on Jan. 12 1910 a bill for this purpose was introduced into the House of Commons, and became law on May 4 1910. It provided for the creation of a Naval Department, and transferred to it from the department of Marine and Fisheries the wireless telegraph, fisheries' protection, hydrographic and tidal survey branches. It empowered the Government to appoint a Naval Board to advise the minister, and to organize and maintain permanent, reserve and volunteer forces, and to place at the disposal of His Majesty, for general service in the Royal Navy, ships or men of the Canadian naval service. Provision was also made for a naval college. During the debate on the bill Sir Wilfrid Laurier announced that it was the intention of the Government to construct, in Canada if possible, four cruisers of the improved "Bristol" class, and six destroyers of the improved "River" class. At conferences with the British Admiralty it was agreed that the naval stations for Canada should be two—one on the Atlantic, to include the waters of 30° N. lat. and west of the meridian of 40° W.; and one on the Pacific, to include the waters north of 30° N. lat. and east of the meridian of 180°. Halifax dockyard was taken over from the Imperial authorities on Jan. 1, 1906, and the dockyard at Esquimalt on Nov. 9, 1910. On Aug. 28, 1911, it was announced that the King had approved the proposal of Canada receiving the style of "The Royal Canadian Navy," and that the ships of the fleet and those new were being designated as "His Majesty's Canadian Ships." On Dec. 16 the following regulations were published with regard to the flag and pennants to be flown by the Royal Canadian Navy: "All ships and vessels of the Royal Canadian Navy shall fly at the stern the white ensign as the symbol of the authority of the Crown, and at the jack-staff the distinctive flag of the Dominion of Canada, such distinctive flag being the blue ensign with the Arms of the Dominion inset in the fly. The white pennant will be flown at the masthead."

In pursuance of Sir Wilfrid Laurier's naval policy, H.M. cruisers "Niobe" and "Rainbow" were purchased and taken over in the autumn of 1910. On July 29, 1911, however, H.M.C.S. "Niobe" sustained damage by grounding on the coast off Cape Sable; her repairs were undertaken at Halifax and took 15 months to complete. The building of the proposed new cruisers and destroyers had, however, not been commenced at the time of the resignation of Sir Wilfrid Laurier's Government.

Mr. Borden's Naval Policy.—The naval policy of Sir Wilfrid Laurier's Government was that of a Canadian-built and Canadian-controlled navy, but this was criticised by the Opposition as involving a large expenditure, a disputed imperial Navy, and the construction of obsolete types of ships. Upon Mr. Borden's acceptance of office, the naval question became one of renewed interest. Mr. Borden stated that in his view the question of permanent cooperation between the Dominion and the rest of the Empire ought to be fully debated and that the Canadian people should be given an opportunity of pronouncing upon it; pains would be taken to ascertain in the meantime what were the real conditions confronting the Empire. In pursuance of this object, Mr. Borden, with several of his colleagues, visited London in July 1912, and were cordially welcomed by Mr. Asquith's Government, and at the Imperial Naval Conference held in July, 1912, to which Canada was invited as a member, of the British Empire, and to which, generally and otherwise, to obtain all the information available as to the problems of British foreign policy and the naval situation as it presented itself to the British Admiralty. The proposals which the Canadian Government founded on the understanding thus arrived at were left, however, to be made public first in the Dominion Parliament after it met in November.

Mr. Borden's speech on Dec. 5, 1912 must always be historic in the relationship between Canada and the mother-country. It was notable for announcing two steps forward in a common Imperial policy: the First, the acceptance by the British and the Dominions of a "Bill to authorize Measures for increasing the effective Naval Forces of the Empire" proposed to contribute $7,000,000 ($35,000,000) for the construction and equipment of three first-class battleships, to be under the control of the British Admiralty as part of the Royal Navy, subject to arrangements for their being at the disposal of the Canadian Government if ever a separate Canadian navy was established. And in the second place, by the agreement of the Imperial Government to include a Canadian minister as one of the permanent members of the Committee of Imperial Defence, the principle was recognized that, if the Dominions took their share in Imperial defence, they must also have a share in determining Imperial policy. The proposal for an "emergency contribution" of three battleships to the British navy was founded on a memo-
random (published in England on Dec. 5 as a parliamentary paper) drawn up by the Admiralty for the information of the Canadian Government as to the existing international situation from a naval point of view; and Mr. Borden read this out.

As regards the three Canadian battleships now to be added to the navy of the United Kingdom, it is stated that, under the Admiralty, the Empire now had what he had conceived for himself was the most thorough and effective naval organization in the world, of which it was the best Canadian policy to make use. The hazardous and costly experiment of building up a separate naval organization for Canada was quite unnecessary, and in any case could only provide a poor and weak substitute. In the present emergency the Canadian ships were best employed as part of the Imperial navy under the Admiralty of the mother-country:

Those ships would be at the disposal of His Majesty the King for the service of the various Offices of the Empire. They will be maintained and controlled as part of the Royal Navy, and we have the assurance that, at any time in the future it will be the will of the Canadian people to establish a Canadian unit of the British Navy, these vessels can be called by the Canadian Government their Navy, in which case, of course, they will be maintained by Canada and not by Great Britain. In that event, there will, necessarily, be reasonable notice, and Canada would not desire or suggest the sudden withdrawal of so powerful and contingent an important theatre in which the naval forces of the Empire might be exposed to severe and sudden attack. In the meantime I am assured that the ships will give Canadians an opportunity of serving as officers in these ships.

The ships will be built under Admiralty supervision in the United Kingdom for the reason that, at present, there are no adequate yards for constructing them in Canada. All the expenses for the construction of dreadnought battleships is enormous, and it would be impossible at present to have shipbuilding in this country on such a scale. In any case, only half could be built in Canada, because the machinery for armour and guns would, necessarily, be constructed or manufactured in the United Kingdom. The additional cost of construction in Canada would be about $12,000,000 for the two ships. I am informed that it would be impossible for Canada to bear the increased cost of more than half as much again as the cost of these vessels themselves, within two or three years at the outer side for rendering aid upon which may depend the Empire's future existence. According to my conception, the effective development of the shipbuilding industries in Canada must commence with small beginnings and in a businesslike way. I have discussed the subject with the Admiralty, and they thoroughly realize that it is not to the Empire's advantage that all shipbuilding facilities should be concentrated in the United Kingdom. It is now the early future to prepare the way for orders for the construction in Canada of small cruisers, oil-tank vessels, and auxiliary craft of various kinds. The production of these will afford valuable employment for the men employed in the shipbuilding yards, and also for those employed in the factories required for the construction of dreadnought battleships, and such an undertaking will have a much more secure and permanent basis from the business standpoint. For the purpose of stimulating so important and necessary a development of the industry, even now, as a means of offsetting a portion of the increased cost for a time at least. I see no reason why all the vessels required in future for our Government service should not be built in Canada, even at some additional cost. In connexion with the development of shipbuilding I would not be surprised to see the establishment of a high class of engineering works which will produce articles now imported and not at present manufactured in Canada. Therefore, although the sum which we propose to devote for necessary naval aid at this critical juncture is to be expended in Great Britain, yet we believe that this step will result, under the conditions which I have described, in the very marked development of our own engineering and shipbuilding industries.

The Canadian expenditure now proposed was, in Mr. Borden's view, a moderate one, regarded not as the beginning of a system of periodical contributions, but as an emergency aid at a moment of crisis:

If we should neglect the duty which we conceive we owe to ourselves, and if irreparable disaster should ensue, what will be our future destiny? Who will ask for the protection of the Horsell, or the place of the Antrim part of the great neighbouring republic. What then would be our responsibilities, and what would be the burden upon us for a protection on the high seas much less powerful and less effective than those of the United Kingdom? Take the case of our nation whose territory, resources, population and wealth may fairly be compared with those in Canada. The naval estimates of Argentina for the years 1907 to 1912 inclusive amounted to $35,000,000 ($7,600,000). No information is available as to the exact proportion of the last-mentioned sum which has been appropriated for naval purposes, but it is understood that the far greater portion is for naval purposes. It is said that the Argentine Navy has been able during the last four years Argentina has expended for naval purposes not less than from $95,000,000 to $70,000,000 ($13,000,000 to $41,000,000). The increase of power of the Argentine State extends the marine forces that comprises a total outlay for armaments of between $250,000,000 to $300,000,000 ($500,000,000 and $600,000,000), or at the rate of $2.75 per head. Similar expenditure by Canada would mean an annual outlay of some $500,000,000, or between $800,000,000 and $1,000,000,000 during the same period.

It is apparent, therefore, that the aid which we propose to bring at this juncture is of a moderate and reasonable character. For Great Britain and the Confederation we have enjoyed the recognition of the Imperial Canadian Navy without the cost of a dollar. . . . So far as official estimates are available, the expenditure of Great Britain on naval and military defence for the purposes which now constitute Canada during the 19th century was not less than $160,000,000 (25,000,000). Even since the inception of our Confederation, and since Canada attained the status of a great Dominion, the amount so spent by Great Britain on the Canadian Navy has amounted. In Canada vastly exceeds the sum which we are now asking Parliament to appropriate. From 1870 to 1890 the proportionate cost of the North Atlantic Squadrons which guarded our coasts was from $125,000,000 to $150,000,000 ($25,000,000 to $30,000,000). From 1893 to 1903 Great Britain's expenditure on military defence in Canada runs closely to $100,000,000.

As regards the voice which it had been arranged that Canada should have on the Committee of Imperial Defence, Mr. Borden said:

With increasing power and influence there has necessarily come, by step and step, a gradual process of coming into being that which, in the future, must become a constitutional development we are necessarily confronted with the problem of combining cooperation with autonomy. It seems most essential that there should be a certain division of responsibility for and the control of foreign policy, . . . When Great Britain no longer assumes sole responsibility for defence upon the high seas she can no longer undertake to assume responsibility for and sole control of foreign policy, which is closely, vitally, and constantly associated with that defence in which the dominions participate. . . . The great dominions, sharing in the defence of the Empire upon the high seas, must necessarily become entitled to some share also in the control and the responsibility for and in the control of foreign policy. Not only His Majesty's ministers, but also the leaders of the opposition political party in Great Britain, have equally accepted this principle.

I have added to the difficulty of finding an acceptable basis upon which the great dominions cooperating with the mother-country in defence can receive and assert an adequate voice in the most important of all of our decisions, the expenditure which has been now estimated on the Committee of Imperial Defence. That committee is peculiarly constituted, but in my judgment is very effective. It consists of the Prime Minister of Great Britain and such persons as he may summon to attend it. Practically all the members of the Cabinet from time to time attend its deliberations, and usually the more important members of the Cabinet are present. In addition, naval and military experts and the technical officers of the various departments concerned are in attendance. A very large portion of the work of the Committee is carried on by sub-committees, which are often committees of persons who are not members of the general committee itself, and who report to the Committee for the whole of the work. A large proportion of the subjects to be considered and reported upon. The amount of work which has thus been performed during the past five or six years is considerable and astonishing, and the control over such expenditure has contributed largely to the safety of the whole Empire in time of peril.

The Committee is not technically or constitutionally responsible to the House of Commons and thus it is not supposed to concern itself with the control of policy. As a matter of fact, no such control is in existence. When summoned to attend the Committee, its conclusions are usually accepted by the Cabinet and thus command the support of the House of Commons. While the Committee does not do the control policy in any way, it does not undertake to do so as it is not responsible to Parliament, it is necessarily and constantly obliged to consider foreign policy and foreign relations for the obvious reason that, so far as is in it, the security of the Empire, and especially naval defence, is inseparably connected with such considerations.

I am assured by His Majesty's Government that, pending a final solution of the question of voice and influence, they would welcome the presence in London of a Canadian minister during the
The distribution of these men was as follows:

<table>
<thead>
<tr>
<th>C.E.F. proceeded overseas</th>

On Sept. 30 1918 about 166,000 men were in France and about 116,000 men in England.

The total Canadian casualties up to and including Feb. 28 1921 were 210,096:

- Killed in action and died of wounds (2,655) 2,655
- Died of other causes (4,063) 4,063
- Wounded (6,347) 6,347
- Prisoners of war (2,583) 2,583
- Still missing (3,729) 3,729
- Total 210,096

The honours gained by the Canadian forces included 62 V.C.'s, 710 D.S.O.'s and 2,885 M.C.'s.

The following summary gives only the more notable engagements in which the Canadian troops fought. The Canadian Army Corps in four divisions, forming part of the I. British Army under Sir J. Byng, was commanded by Lt.-Gen. Sir Arthur Currie. In 1915 the I. Division greatly distinguished itself in the second battle of Ypres on April 22, and again at Festubert and Givenchy in May and June. In 1916 the Canadians, now forming three divisions, were heavily engaged at St. Éloi in April, and at Sanctuary Wood and Hooge in June. In Sept., Oct., and Nov. the four Canadian divisions fought in the battle of the Somme, especially distinguishing themselves at Courcellette, Mouquet Farm, and the Kenora, Regina and Désiré trenches. In 1917 the Canadian troops bore the largest part in the taking of Vimy Ridge (April 9) and of Artois and Fresnes (April 28 and May 3), and fought with great success in the advance on Lens and the taking of Hill 70 in August. They were again heavily engaged in the fighting round Passchendaele in Oct. and Nov., capturing all their objectives in spite of severe losses. In 1918 the Canadian cavalry, motor machine-guns, and railway troops were active in the resistance to the German advance in March. The Canadian Corps was in the centre of the British front in the second battle of Amiens, Aug. 8-17, advancing 14,000 yd. on the first day, the deepest advance made in one day during the war. In the battle of Arras, at the beginning of Sept., the Canadians played an important part in the breaking of the Quaint-Drocourt line, a part of the Hindenburg system. The Canadian casualties in these two actions were serious, but less than the number of prisoners taken. In the battle of Cambrai, which began on Sept. 27, the Canadians on Oct. 9, after heavy
losses, took Cambrai and made large captures of men and material. In the final stage of the fighting Demain was taken by the Canadians on Oct. 25. Valenciennes on Nov. 2, and Mons at 4 A.M. on Nov. 11, the day on which the Armistice came into force at 11 A.M. The Canadian troops captured 45,000 prisoners, 850 artillery guns, and 4,200 machine guns, retook 130 towns and villages, and liberated 310,000 French and Belgian civilians. Canadian units also served in Palestine, Macedonia, and Russia.

The Canadian cavalry fought, for the most part, separately from the Canadian Army Corps. They distinguished themselves in March 1917 by the capture of six villages in two days, and in December in the attack on Villers-Guislain. In the German offensive of March 1918, the Cavalry Brigade was actively engaged and suffered heavy casualties at Bois Morcuil, Riile Wood and elsewhere. The brigade fought as part of the Canadian Corps in the second battle of Amiens, and, in the great advance at the end of the fighting, captured the town of Le Cateau on Oct. 9. Canadian railway units were attached to all the British armies; these troops were responsible for the whole of the construction of light railways and 65% of the standard-gauge railways in the area occupied by the British forces. In addition to the units of the Canadian Corps and the Royal Flying Corps, numbers of Canadians were engaged in Great Britain in cutting and milling timber.

During the war, 1,617 medical officers, 2,002 nursing sisters and 12,382 other ranks of the Canadian Army Medical Corps went overseas from Canada. There were in Canada at the end of the war, 913 medical officers, 272 nursing sisters, 182 V.A.D. nurses, and 4,012 other ranks. The Medical Corps had in France 6 general hospitals, 6 stationary hospitals, 6 casualty clearing stations, and 13 field ambulances, and in England 9 active treatment hospitals, 5 special hospitals, 5 convalescent hospitals, and a special section. In Canada there were 65 military hospitals, with 11,786 beds. Some 25,300 patients were brought back to Canada in 1917 and 1918 on 35 passages of hospital ships. On 27 of these passages the C.A.M.C. provided the staffs of the ships. The "Llandovery Castle" was sunk by a submarine while returning from Canada to England.

About 12,000 troops were required in Canada for home defence—as garrisons for fortresses and guards for internment camps, cantons, etc. Canada also furnished a garrison for the important post of St. Lucia in the West Indies. There were 17,902 Canadians in the Royal Air Force, and its predecessors the Royal Naval Air Service and the Royal Flying Corps. In addition, a number of American soldiers were trained in Canada by the instructional staff of the Royal Air Force. Some 4,701 men were furnished from Canada for the Imperial Service known as the Inland Waterways and Docks. About 710 Canadians joined the Imperial Motor Transport Service, and several hundred Canadians, mostly from the universities, received commissions in the British army. Canada also furnished several hundred doctors and veterinarians and about 200 nurses to the British army. Some 200 Canadian officers were sent, as instructors, to the United States.

As regards the naval service, at the outbreak of the war in 1914 the Canadian Government possessed only two naval vessels—"Niobe," a cruiser of 11,000 tons displacement, with a main armament of 16-in. guns, stationed at Halifax, and the "Rainbow," a small cruiser of 3,600 tons displacement, armed with 2 6-in., 6 4·7-in., and 4 12-pounder guns, stationed at Esquimalt, on the Pacific. The "Rainbow," which was ready for sea, patrolled, with other ships on the Pacific stations, as far south as Panama, and captured several ships carrying contraband of war. After the entry of the United States into the war she became depot-ship on the Pacific coast. The "Niobe" was made ready for sea in Sept. 1914 and remained in commission one year, during which she steamed over 30,000 m. on patrol duty. She afterwards became depot-ship at Halifax.

At the beginning of hostilities various small craft were taken over by the Naval Department from the Departments of Marine and of Customs, and were armed and manned by the R.C.N.V.R. for the performance of patrol duties off the Atlantic coast. Two submarines, which were bought just before the declaration of war patrolled the approaches to Victoria and Vancouver and helped in keeping Adm. von Spee's squadron away from the Pacific ports. H.M. sloop "Shearwater" was taken into the Canadian service as mother-ship to these submarines and, in the summer of 1917, these three vessels went, by way of the Panama Canal, to Halifax. A patrol and mine-sweeping service was carried on after the outbreak of war. The vessels used at first were Government and privately owned vessels which were taken over and equipped for the purpose. Some of these were placed at the disposal of the Government free of charge. Early in 1917 the Department of Naval Service undertook to have 60 trawlers and 100 drifters built in Canada for the Imperial Government. These vessels were to be used for places on the St. Lawrence and the Great Lakes, many of them were in service in Canadian and European waters in the year 1917 and all were in service in 1918. The area patrolled under the Department stretched from the Straits of Belle Isle to the Bay of Fundy, and from Quebec to east of the Virgin Rocks. Within this area the Department had control of patrols, convoys, mine-sweeping, the protection of fishing fleets, etc. Only one large vessel was lost by enemy attack.

At the date of the Armistice the vessels in the Canadian naval service were as follows: In the Pacific: H.M.C.S. "Rainbow," depot and training ship; H.M.S. "Algerine," sloop; auxiliary patrol ship "Malaspina," and motor launches for harbour defence. In the Atlantic: H.M.C.S. "Niobe," depot and training ship; H.M.C.S. "Shearwater," submarine depot ship, and 2 submarines; H.M.C.S. "Grilse," torpedo-boat destroyer; 9 auxiliary patrol ships, 47 armed trawlers, 58 armed drifters, 11 armed mine-sweepers and tugs, and a large flotilla of motor-launches. The crews of these vessels consisted of men from all parts of Canada, principally members of the Royal Canadian Naval Volunteer Reserve. At the date of the Armistice the personnel of the service was: officers and men of the Royal Canadian Navy, 749; officers and men of the Royal Canadian Naval Volunteer Reserve, 4,374.

In addition to the men serving in Canada, 21,220 men were recruited in Canada for the Imperial navy, 73 surgeon probationers and a number of hydrographic survey officers were sent from Canada and 350 Canadians enrolled as probationary flight lieutenants in the Royal Naval Air Service, before recruiting for the Royal Air Force began in Canada. More than 500 Canadians holding commissions in the Royal Naval Volunteer Reserve were in the British Auxiliary Patrol and similar services. The Royal Canadian Naval Air Service was established in the summer of 1918, with stations at Halifax and North Sydney. In all, 245 Canadian aircraft (100. V.R. aircraft and 145 flying boats) patrolled the coast and escorting convoys through the danger zone.

The Canadian Radiotelegraph Service controlled about 200 stations ashore and afloat. Several new stations were erected or taken over by the Department of Naval Service, and there was an unbroken chain of radio communication from St. John's, Newfoundland, to Demerara. The Department opened a training school for wireless operators, from which about 200 men were sent out for service in all parts of the world.

Important refitting, repairing and supply work was done by the Canadian dockyards. Canada refineries Imperial and other ships were made at Esquimalt, including H.M.S. "Kent," after the battle of the Falkland Is., and the Japanese battleship "Asama," after grounding on the coast of Lower California. Several large cruisers were refitted at Halifax and Montreal. Other work included the defensive armament of merchant ships, the refitting of transports for troops, horses and special cargo, and the loading and securing on ships' decks of 600 large launches, tugs, etc.

The Canadian Naval Service provided supplies for the ships of the Royal Canadian Navy and for a number of Imperial and Allied ships in Canadian waters, as well as many of the requirements of H.M. dockyards at Bermuda and Hong-Kong. Large supplies were shipped from Halifax dockyard for provisioning the fleets in European waters. A large coaling depot was established at Sydney for the use of patrolling vessels and of all convoys leaving the St. Lawrence.

In shipbuilding Canada had a splendid war record. Nearly 1,000 vessels of one kind or another were turned out for the vari-
ous Allied Governments, these including steel and wooden freighters, submarines, coastal patrol boats, lighters, drifters, etc. During the war period not only was steel shipbuilding revived but the steel shipbuilding industry was placed firmly on its feet; for whereas in 1914 Canada had only two thoroughly up-to-date steel shipbuilding plants, in 1918 she had seventeen. In 1919 25,000 men were employed in the industry. The Department of Naval Service secured many of the first of these orders.

The Imperial Munitions Board, acting as the agent for the Imperial and Allied Governments, placed contracts with Canadian yards for $790,000,000 worth of shipping. In 1918 the Dominion Government, through the Department of Marine and Fisheries, had assumed its shipbuilding programme, which in entirety called for 63 steel vessels having a deadweight tonnage of 375,000, constituting its own mercantile marine. The approximate value of these orders was $75,000,000. The first contract was signed on March 4 1918. All these vessels were built in Canadian yards and of Canadian material.

Canada became thoroughly and quickly organized for carrying on the war in all its phases. There were a number of committees, commissions, boards, etc., formed for various purposes, the members of which worked voluntarily. These were the Shell Committee, the Imperial Munitions Board (which had a wide scope and responsibilities), War Trade Board, Board of Grain Supervisors, War Mission to Washington, the Food Board (under the direction of a food controller), Fuel Control (under the direction of a fuel controller), and the Canadian Railway War Board.

Canadians gave liberally to all the organizations engaged in relief and help of any kind. The following is a summary of gifts for various war purposes from the Dominion and Provincial Governments, from municipalities, societies, universities, business houses and other corporations, and from private individuals:

- **Canadian Patriotic Fund (to Feb. 28 1917)**
  - Total: $164,704,665

- **Manitoba Patriotic Fund (to March 31 1918)**

  - Gifts in supplies (estimated): 1,512,900

- **Contributions from Canada to Y.M.C.A. for military work**
  - Total: 4,574,821

- **Gifts from Dominion and Provincial Governments to Government of United Kingdom**
  - Total: 5,469,316

- **Miscellaneous gifts**
  - Total: 8,000,000

**Total:** $104,184,954

Of the various war organizations working in Canada, or among Canadian troops overseas, the most extensive in their operations were the Canadian Patriotic Fund, the Canadian Red Cross Society, and the military branch of the Y.M.C.A. The Canadian St. John Ambulance Association and Brigade, which were branches of the Order of St. John of Jerusalem in England, coordinated their war work with the Canadian Red Cross Society. The Association during the five years of the war instructed 61,612 Canadians in first aid and home nursing, for volunteer work either in Canada or overseas. In addition courses in first aid were given to 200,000 troops while in training in Canada.

Statistics, however complete, can give only an imperfect impression of the services which Canadian women rendered during the war. Women to the number of 2,400 went overseas in the C.E.F. and served in England, France, Belgium, Egypt, Greece and Russia. They were posted for duty in base hospitals, clearing stations, ambulance trains and hospital ships. There were also 327 on duty in Canada.

The casualties suffered by nurses were:

- Killed in action: 2
- Died at sea: 13
- Died of wounds: 5
- Died of disease (out of Canada): 17

The number of V.A.D.s who went overseas was 342; these served in hospitals in England and France. Many hundreds of Canadian women served in Canada as volunteer hospital probationers in military hospitals and in England, under the Joint War Committee's Women's V.A.D. Department.

**Retired Soldiers**—Some time before the close of the war provision was made by the Government by repeated Acts for the care of the returned soldiers. The Military Hospitals Commission was appointed in June 1915. It provided 16 hospital cars and had hospital accommodation at the commencement of 1917 for 1,500 patients. It provided during 1917 10,000 beds in 40 centres. Vocational training for disabled men was organized in 1916. The number who commenced courses was 50,521, those who completed 36,526, and those who discontinued 8,915. In Feb. 1919 a Department of Soldiers' Civil Re-establishment was organized to take over the work of the Hospitals Commission. An arrangement was made for the treatment of 70,000 men, and 81,650 the approximate number of pensions paid to Dec. 1920. The value of pensions in force at the end of 1920 was $4,083,502, and the amount in force on that date was $3,116,520. At various times from 1914 to 1920 the rate of pensions was substantially increased. For instance in 1914 the rate per annum for disability was $264, and in 1920 it was $900, with $300 for the wife, $180 for one child and a lesser amount for subsequent children. The annual rate for dependents of deceased soldiers increased practically in the same proportion. In addition to pensions, war service gratuities were paid to the amount of $1,045,000. Added to the pension system was a provision made for Government insurance of returned soldiers, including naval and air forces. The amount of insurance in force in 1922 was $5,225,000. Applications received amounted to 1,705.

The Soldier Settlement Act made provision for the settlement of returned soldiers on the land. It empowered a board consisting of three members to make a soldier grant of 160 ac. of Dominion land in the Western Provinces, and returned men were also eligible for a civil homestead of another 160 acres. The Act also empowered the board to make loans to enable returned men to settle in any province. Loans might be granted up to $7,500 to qualified settlers purchasing land through the board, the settler to pay down 10% of the cash value of the land; up to $7,000 for equipment and improvements, and up to $5,000 to settlers who already owned land to enable them to pay off old mortgages and to purchase live stock and implements and to erect buildings. Up to March 31 1921 the board received 59,331 applications; 43,063 were granted certificates; 25,443 had gone on the land, 10,771 of whom received financial assistance amounting to $80,377,579. The total area of land occupied by soldier settlers under the Act was 4,854,799 ac.—- purchased land 2,153,184 ac., encumbered land 360,227 ac., soldier grants (with loans) 980,180 ac., soldier grants (without loans) 1,361,280 ac. The value of the main crops produced by soldier settlers in 1920 was $15,953,178.

The following figures show the number of loans approved and the amounts by provinces:

These loans were for the following purposes:—

To purchase land ........................................ \$44,983,951
To remove encumbrances ................................ 2,213,897
For permanent improvements .......................... 9,488,394
For stock and equipment ............................... 25,268,700
Total ...................................................... \$81,354,948

The Dominion Government also appropriated the sum of $25,000,000 for housing in Canada. The object of the Government was to provide houses for working-men, particularly returned soldiers, at the actual cost of building and land acquired at a fair value, thus eliminating the profits of the speculator.

After the War.—One result of the war was that Canada, along with other dominions, acquired a substantially new status in the Empire. Sir Robert Borden, as Canadian Prime Minister, was a member of the Imperial War Cabinet. Members of the Canadian Government attended the Peace Conferences, signed the Peace Treaties, and were members and participants in the deliberations of the League of Nations. Finally it was decided that Canada should be represented at Washington by a Canadian ambassador, distinct from, and with responsibilities quite apart from those of the British ambassador.

During the war a general election had taken place on Dec. 17, 1917, the Unionist Government under Sir R. Borden being opposed by the Laurier Liberals, the result being the return of 150 Unionists and 86 Opposition members. After the signing of the Armistice a certain number of the Liberals elected as Unionists, supporting the Government returned to the Liberal side of the House in Opposition. As the result of by-elections, representatives of the Farmers' party were also elected and sat upon the cross-benches, which included several former Liberals from the Middle West. At the close of the 1920 session of Parliament the Unionist party by that name ceased to exist, and there was formed the National Liberal and Conservative party, with a policy strongly protective in principle. In Aug. 1919, as the result of the death of Sir W. Laurier (Feb. 17, 1919), a huge convention of Liberals was held at Ottawa to select a leader in succession to him, and to frame a new platform. After an exciting contest of several weeks Hon. William Lyon Mackenzie King was elected, and a fiscal policy was approved in favour of free imports of all foodstuffs and implements of production.

On March 21, 1921, Sir Robert Borden having resigned the premiership, Mr. Arthur Meighen (b. 1874), as his successor in the Conservative leadership, was called upon to form a government. It included Sir George E. Foster as Minister for Trade and Commerce. Mr. Meighen subsequently attended the Imperial Conference in London in July 1921. But he and his party, standing on a high tariff platform, were heavily defeated at the general elections on Dec. 6. For the first time in Canada, women exercised the vote. The Liberal party, under Mr. King, were returned 121 strong, the Conservatives numbering only 51, the Progressives (under Mr. T. A. Cerrr) 60, and Independents 2. The result was a victory for the Liberal policy of a tariff for revenue only, with British preference, but with reciprocity as regards the United States. Mr. Mackenzie King (b. 1874), who had been Minister for Labour for eight years under Laurier, thus found himself at the head of a clear majority over all other parties.

Lord Jellicoe and the Canadian Navy.—In pursuance of instructions from the Lords of the Admiralty to advise the Dominion in respect of a scheme of naval defence, Lord Jellicoe visited Canada in 1919 and his report was issued early in 1920. On June 14, 1920 the Hon. C. C. Ballantyne made an official statement of policy in the Canadian House of Commons. He stated that the Government had not yet decided on a permanent programme, and would not so decide until after the matter had been discussed by an Imperial Conference and a decision had been arrived at by Great Britain on an Imperial naval policy. In the meantime the Canadian navy would be maintained on pre-war lines. The offer by the Imperial Government of one light cruiser and two torpedo-boat destroyers to take the place of the obsolete training ships, the “Niobe” and the “Rainbow,” had been accepted. To make way for reorganization, it had been decided to demobilize all officers and naval ratings, discharge certain civilian help at headquarters and at the naval dockyards at Esquimalt and Halifax, to recall all officers with the Imperial fleet and place them in the Canadian service, and to continue the Naval College.

Prince of Wales' Visit, 1919.—The year 1919 was made notable by the visit of the Prince of Wales. King Edward VII., as Prince of Wales, had visited Canada in 1860, and King George V., in the same capacity, in 1901. This tour of the Prince of Wales in 1919, however, was the most extensive ever made by any member of the royal family. He arrived in St. John's, Newfoundland, on Aug. 12, and from Aug. 15 to his departure for England from Halifax on Nov. 25 he visited every part of Canada accessible by railway communication from the Atlantic to the Pacific, being welcomed with the enthusiasm everywhere; and in the course of his visit the Prince laid the corner-stone of the new Parliament Buildings at Ottawa.

Prohibition.—After the commencement of the World War all the Canadian provinces took steps toward the prohibition of intoxicants or the severe restriction of their use, as a war measure, to be effective during the period of the war. In British Columbia this was brought about by the submission of a referendum in the form of a statute. In other provinces prohibition measures were the results of direct action by the Legislatures. In Nova Scotia, Prince Edward Island, and Prince Edward I. had been largely “dry” before the war under the local option provisions of the Canada Temperance Act, but these, too, tightened up the existing law by provincial measures. In nearly every instance the purchase of liquors, with the exception of very light beer, where the sale of this was permitted, was possible only through medical prescription, and liquors were only available at drugstores or Government shops. In Quebec a bill introduced in 1918 provided for total prohibition on May 1, 1919. A subsequent bill of 1919 retained all the clauses of the Act of 1918, except in respect of the sale and use of beer and light wines, which were subject to a referendum, the result of which was: in favour, 178,112; against, 48,433. In the four western provinces complaint was made by prohibitionists of the laxity of enforcement, which was admitted in official quarters to be a matter of great difficulty, and a discussion arose in all the provinces as to the advisability of restrictive measures of the nature then in force. On the prohibitionist side it was urged that more stringent laws should be enacted and better machinery provided for enforcement. On the other, the “moderation” side, Government control was advocated. An appeal was made to the Dominion authorities to prevent manufacture and the export and import as among provinces. Two provinces, British Columbia and Quebec, declared for Government control, and in both that system became effective. The Government of Canada endeavoured through the House of Commons to restrict the manufacture, transportation and importation of liquors during the war and for 12 months thereafter, but the measure was defeated in the Senate and abandoned. A subsequent law was enacted leaving the matter in the hands of the various provinces, as the result of referenda.

By statute ascertained to on Nov. 10, 1919 provision was made for taking, at the request of any provincial legislature by resolution, a vote in the province upon the question whether the importation of intoxicating liquor therein should be prohibited, and the vote to be carried for such votes, previously defective, was improved in 1920 by another statute, assented to on July 1, 1920. Proclamations were at once issued directing votes to be taken on Oct. 25 following in the provinces of Nova Scotia, Manitoba, Alberta, Saskatchewan, and Ontario. These votes resulted as follows:—

The Yukon territory in June 1921 carried a referendum in favour of sale of intoxicants under Government control. It had previously been “dry.”

Viceroy.—As governor-general of Canada Earl Grey had been succeeded in 1911 by the Duke of Connaught, who in turn was
succeeded by the Duke of Devonshire in 1916; and when the Duke of Devonshire's term expired on July 18, 1921, he was succeeded by Gen. Lord Byng of Vimy. (W. L. G.)

Canadian Literature

English-Canadian.—The literary record of Canada in 1910-21 falls more or less definitely into three sections—pre-war, war, and post-war. During the war years the heart of the Canadian people was completely devoted to the great conflict in which they had so much at stake, that, after the first year or so at any rate, there remained little room for any intellectual activity not connected directly or indirectly with the war and its successful prosecution. The new literature of 1910-14 had reflected the characteristic of the Dominion in those years—a spirit of optimism, of national self-consciousness, of conservatism in the broader sense, and intellectually of wider and more stimulating horizons. And the return to peace conditions, during 1918-21, was mainly noticeable in literature for more or less thoughtful reviews of Canada's part in the war, consideration of her problems of reconstruction, and the picking up anew of some of the somewhat neglected threads of her intellectual life.

Unquestionably the most important achievement of the pre-war period was the publication of Canada and its Provinces, a comprehensive survey of the history of the country in 23 volumes, edited by Dr. A. G. Doughty and Dr. Adam Shortt, and counting among its contributors most of the recognized authorities in Canadian history, biography and economics. Another notable essay in Canadian history was the series known as the Chronicles of Canada, in 32 volumes, edited by George M. Wrong and H. H. Langton, a series designed to present in attractive and at the same time authoritative form the outstanding events of Canadian history. The authors of the individual volumes included such well-known writers as Charles W. Colby, of McGill University, Col. William Wood, Stephen Leacock, Dr. Doughty, Oscar D. Skelton, of Queen's University, and Sir Joseph Pope. The publication in 1911 of an Index and Dictionary of Canadian History completed the series of biographies known as The Makers of Canada.

The celebration of the tercentenary of the founding of Quebec brought in its train, with a flood of purely ephemeral literature, several books of permanent value, such as The King's Book of Quebec (1911), edited by Dr. Doughty and Col. Wood, James Douglas' New England and New France (1913), Wood's In the Heart of Old Canada (1913), and Prof. Wrong's The Fall of Canada (1914). In 1912 the Hudson's Bay Company celebrated its 250th birthday with elaborate pageants in Winnipeg and elsewhere throughout the West. The occasion was also marked by the publication of a very completely illustrated history of the Company. In 1921 McGill University celebrated the 100th anniversary of its charter.

This period also witnessed a succession of biographies and autobiographies of famous Canadians, including Beckles Wilson's Lord Strathcona (1911) and W. T. R. Preston's pungent life of the same many-sided character, Sir Richard Cartwright's Reminiscences (1912), Sir George W. Ross' Getting into Parliament and After (1912), L. J. Burpee's Sir Sanford Fleming (1915), John Boyd's Sir George Etienne Carlier (1914), Sir Charles Tupper's Recollections of Sixty Years in Canada (1914), and Goldsmith Smith's posthumous Reminiscences (1916), Life and Opinions (1913) and Correspondence (1913), all three edited by his literary executor, Arnold Haultain.

Other noteworthy books of this period are W. H. Atherton's book of 1913, 1535-1870 (1914), John Roden Roberts, Loyalists of Toronto (1910), E. H. Power's The Canadian North-West (1914), and Doughty and McArthur's Documents relating to the Constitutional History of Canada, 1701-1878 (1914); and in books of description and travel, A. P. Coleman's The Canadian Rockies (1911), Ernest Thompson Seton's Arctic Prairies (1911), Dr. Campbell's Canadian Lake Region (1910), and Charles Sheldon's Wilderness of the Upper Yukon (1911). Among a host of political and economic essays may be mentioned John S. Ewart's The Kingdom Papers (1914), Sir William Peterson's Canadian Essays and Addresses (1915), Sir George Foster's Canadian Addresses (1914), Sir Andrew Macphail's Essays in Politics (1910), Maj.-Gen. C. W. Robinson's Canada and Canadian Defence (1910), and Edward Purriott's Revolt in Canada against the New Federalism (1911). In 1913 a new edition also appeared of Col. George T. Denison's History of Cavalry, written as early as 1876, and awarded in the following year the prize offered by the Tsar of Russia for the best essay on the subject.

Among the books that need be noted here are Bliss Carman's Echoes from Yukon (1912), William Williard Campbell's Sagas of Vester Brittain (1914), William Henry Drummond's Postcards Works (1912), Marjorie Pickthall's Drift of Pinions (1913), Frederick George Scott's Poems (1912), and Arthur J. Stringer's Open Water (1914). In 1913 Dr. Campbell brought out his excellent anthology, The Oxford Book of Canadian Verse. In fiction, the most noteworthy names are those of Miss L. M. Montgomery, Charles G. D. Roberts, Norman Duncan, C. W. Gordon (''Ralph Connor''), Theodore Roberts, Alan Sullivan and Arthur Stringer.

With regard to the literature of the war, or of Canada's part in it, many volumes of personal experiences had already been published by 1921. A really notable book is Winged Warfare (1918) by Col. William A. Bishop, V.C. Others that may be noted here are Col. George G. Naismith's On the Fringe of the Great Fight (1917), F. C. Curry's From the St. Lawrence to the Yser (1917), F. McKelvey Bell's First Canadians in France (1917), and Captured by Lieut. J. Harvey Douglas (1918). In 1917 appeared the first of six volumes of Canada in the Great World War (completed in 1921), an authoritative account of Canada's part in the conflict, by a number of competent writers. An official history of the war, from a Canadian viewpoint, under the title of Canada in Flanders, the first two volumes of which were prepared by Lord Beaverbrook and the third by Maj. Charles G. D. Roberts, appeared in 1916-8. Other war books of interest are Col. J. G. Adami's Official War Story of the C.A. M.C. (1919), Dr. Herbert A. Bruce's Politics and the C.A.M.C. (1919), J. F. B. Livesay's Canada's Hundred Days (1910), Hon. Henri S. Béland's Three Years in a German Prison (1919), Alan Sullivan's Aviation in Canada (1919), Capt. Harwood Steele's Canadians in France (1920), John W. Dalou's Over the Canadian Battlefields (1919), and Sir Robert Borden's The War and the Future (1917). Through the foresight of Lord Beaverbrook and Dr. Doughty, Canada acquired an exceptionally complete collection of war records, paintings, and trophies.

Among the more significant of the post-war books are Sir Robert Falconer's Idealism in National Character (1920), J. L. Morison's British Supremacy and Canadian Self-Government (1919), Hon. W. L. Mackenzie King's Industry and Humanity (1918), R. M. MacIver's Labour in the Changing World (1919), W. C. Good's Production and Taxation in Canada (1919), A. H. Reginald Buller's Essays on Wheat (1919), Prof. Wrong's The United States and Canada (1921), W. G. Smith's Study in Canadian Immigration (1920), and two books discussing the relations between English-speaking and French-speaking Canada—O. W. H. Moore's The Clash (1918) and P. F. Morley's Bridging the Chasm (1919).

In history and biography there were such important works as J. S. McLennan's Louisbourg (1918), Chester Martin's Lord Selkirk's Work in Canada (1916), G. C. Davidson's North West Company (1910), William Smith's History of the Post Office 1659-1870 (1920), W. R. Riddell's Old Province Tales (1920), Prof. Skelton's The Canadian Dominion (1919), Sir John Willison's Reminiscences (1919), W. T. Greer's A Labrador Doctor (1919), E. M. Saunders' Life of Sir Charles Tupper (1916), Skelton's Sir Alexander Galt (1920), and Sir Wilfrid Laurier (1921), Sir Joseph Pope's Correspondence of Sir John Macdonald (1921) and Walter Vaughan's Sir William Van Horne (1920). The Historical Section of the Canadian General Staff issued the first three volumes of an official History of the Military and Naval Forces of Canada from 1752 (1920-21).

Of agencies which, each in its own way, were making in these later years for the development of intellectual life and scholar-
ship in Canada, none was more important than the Dominion Archives, the Royal Society of Canada, the Champlain Society, and two important Canadian periodicals, the University Magazine and the Canadian Historical Review. The Archives perform a triple service, in collecting and safeguarding the manuscript treasures of Canada, in affording facilities for research to students, and in publishing selected documents from its collections. The Champlain Society, with headquarters in Toronto, devotes itself to the publication of important works bearing upon Canadian history, and the reprinting of old works in the same field. J. B. Tyrrell's editions of Hearn's Journey (1917) and David Thompson's Journals (1916), Dr. Doughty's edition of Knox's Historical Journal (1914-16), Grant and Bigger's edition of the Archives of the Royal Society of Canada, and Col. Wood's Select British Documents of the Canadian War of 1812 (1920), are admirable examples of Canadian scholarship. The establishment of the University Magazine under the control of three of the principal Canadian universities, and the transformation of the annual Review of Historical Publications Relating to Canada into a quarterly Canadian Historical Review widened the opportunities for the intellectual discussion of Canadian questions by Canadian writers in a Canadian periodical.

In imaginative literature during this later period, there are found several arresting books, such as Clive Chillingworth's Songs from a Young Man's Land (1917), John McCracken's In Flanders Fields (1918), Lloyd Roberts' Poems (1919), Norah Holland's spun Yarn and Spindrift (1918), Marjorie Pickthall's The Lamp of Poor Souls (1916), Bliss Carman's April Airs (1916), Duncan Campbell Scott's Lundy's Lane and Other Poems (1916) and Beauty of Life (1921), Arthur S. Bourinot's Poems (1921), and Bernard F. Trotter's Canadian Twilight (1917). In fiction, the principal names were Sir Gilbert Parker, C. G. D. Roberts, Arthur Stringer, Theodore Roberts, W. A. Fraser, L. M. Montgomery, C. W. Gordon, Basil King and Norman D. A. MacKean. Among Canadian humorists Stephen Leacock (b. 1869 in England, but the son of Upper Canada College, 1891-92, and later head of the department of political economy at McGill University) during 1911-1921 had gradually established a widespread popularity, and his volumes of humorous essays and sketches gave him an international reputation as a writer, somewhat eclipsing his professional position as an economist. In this connexion also may be mentioned the Goblin, a really excellent comic monthly published by undergraduates of Toronto University. Two delightful books for children are Isabel Ecclestone MacKean's The Shining Ship (1918) and Cyrus MacMillan's Canadian Winter Tales (1918). R. F. Baker has written a History of English Canadian Literature to Confederation (1920).

French-Canadian.—During 1910-1911 there was a very natural desire among French-Canadian writers to do all that could be done toward keeping their compatriots true to type in race, religion, speech, thought, aspiration, letters and whatever else might encourage a distinctive form of life to persist unchanged by contact with the English-speaking world. Among the extreme Nationalists this unfortunately led to a self-conscious particularism, tending rather to weaken both ideas and expression than to strengthen them; and a false and assuaged position in the intellectual world at large. The best written, however, of all the French-Canadian papers was Le Devoir, edited by Henri Bourassa, the Nationalist chief, who had kept it easily first in literary excellence, with the able assistance of Omer Héroux, Georges Pelletier, Ernest Bideau, Madame E. P. Benoît (“Monique”), and Madame H. St. Jacques (“Fadette”). Another Ultra, the Abbé Lionel Groulx, edited L'Action Française, a monthly numbering among its contributors that excellent stylist, Fère Beaudet, whose nom de plume is Henri d'Arès. A wider outlook was taken by Le Canada Français, successor to La Nouvelle-France, once led by the scholarly pen of the Rev. Camille Roy. The widest and most diverse views were to be found in La Revue Moderne, edited by Madame Huguenin. La Revue Trimestrielle also took broad views, and had done good service to literature.

Three types of French-Canadian history were represented by: (1) the Histoire du Canada, a big school-book written by the Christian Brothers from their own point of view, and without any reference to archives; (2) the five volumes of the Cours d'Historie, ardently written by the Abbé Groulx in admirable French, and based on original sources, but carefully dividing the sheep of his own party from the goats of all others; and (3) the Cours d'Histoire du Canada by Thomas Chapais, whose scholarly taste, deep reverence for original research, and wide experience of public life preeminently fitted him for his distinguished role as professor of the Université Laval. Montreal was highly favoured in possessing that indefatigable archivist, E. Z. Massicotte. But Quebec was the headquarters of the new Provincial Archives, established in 1920 under the direction of Pierre Georges Roy, whose name has become famous for all that concerns the discovery, study, classification, and enlightened cataloguing of original documents, as well as for archival work at large.

Folklore was more and more studied by C. Marius Barbeau (Dominion Anthropologist), E. Z. Massicotte, C. Tremblay, Dr. Cloutier, Gustave Lactot, and others. The Journal of American Folklore devotes one number a year to the work of French-Canadians.

The literature made a very real advance in the decade. The great French-Canadian drama was still to seek; but in poetry Jean Nolin's Les Cailloux showed good achievement and still greater promise, while power was the predominant note of Charles Gill's Le Cap Éternité. Two women who emerged as poets had already done well and seemed likely to do better: Marie Le Franc's Les Voix au Cœur et l'Ame is both psychology and art; while Blanche Lamontagne's Visions Gaspesiennes, Par Nos Champs et Nos Rives, and La Vieille Maison showed a continual advance from merely tuneful and rather diffuse description to something like creation. Jules Fournier and Olivier Asselin, both most competent critics, had edited the Anthologie des Poètes Canadiens (1920). Fiction was well represented by Damase Potvin's L'Appel de la Terre. The late Louis Hémon, a Frenchman who lived and worked with the French-Canadian habitants, had, in his Maria Chapdelaine (1916), written a novel which was a true work of art and racy of the soil. In other literature Laure Conan produced the best of introspective sketches in L'Oublise Souffrance, which is a kind of journal imaginaire. Her terse and finely chosen style greatly helped her penetrating vision to reach the very heart of her subject in everything she wrote, as, for instance, in her Silhouettes Gaspesiennes. Edouard Montpetit was both reminiscent and "provisionist" in his Au Servie de la Tradition Française. And Adjutor Rivard, whose Chez nos Gens gives moving glimpses of habitant life, has placed all students of French under a deep debt of gratitude in his magnificent Études sur les Parlers du Canada.

Canalejas y Méndez, José (1854-1912), Spanish politician, was born in Ferrol July 31 1854. Coming of a middle-class family with university connections, he graduated (1871) at the university of Madrid and took his doctor's degree (1872), becoming lecturer on literature (1873). For a time he entered his father's engineering works as an architect (1890). Fiction was well represented and "provisionist" in his Au Servie de la Tradition Française. And Adjutor Rivard, whose Chez nos Gens gives moving glimpses of habitant life, has placed all students of French under a deep debt of gratitude in his magnificent Études sur les Parlers du Canada.

W. (W.)
The rights of the State against the encroachments of the Church. By his death the Spanish Liberal party lost the only statesman capable of uniting it under one definite programme.

The (-----)--- Nationalist movement which was witnessed in the years from 1910 to 1913 in the general attitude of medical men to the problem of cancer. Some new considerations have been submitted, however, and some new aspects of the subject disclosed. Industrial cancers occurring in tar workers and workers in paraffin shale have been the subject of observation by the Home Office in England, while the association between certain of the aniline products and malignant disease of the bladder has been pointed out in connection with the health of German dye workers. Sir George Lenhal Chastel has published, too, some observations on the value of painting of breast cancers which tend to show a passage up the milk ducts.

Generally speaking, the view is still held that while cancer tends to make its appearance on areas which have been subjected to irritation of one kind or another, there remains an unknown factor which determines its actual onset. Only a small percentage of cases which are subject to chronic irritation ever become malignant. This fact alone rules out the explanation of new growth in terms of local or even general irritation—a consideration which applies even to cancers in radiological practice.

In these circumstances a special interest attaches to the recent experimental work of Dr. F. Fibiger, of Copenhagen. A worker obtained for experimental purposes a number of rats. On examination he found that several of these had carcinoma of the stomach and had apparently been dealer with animals suffering from cancers. After most painstaking investigations Fibiger found that all these rats came from a certain sugar refinery which was infested with cockroaches. He obtained some of the cockroaches and had them examined. The animals were found to be infested with an unknown nematode worm. This worm was consequently named spirontura neoplastic. The female is 4 to 5 cm. long by about 0.5 mm. in diameter; the male less than half this size. The eggs are oval and clear and measure about 0.06 mm. in length and contain curled-up embryos. They can be seen in the body of the female or in the upper layers of the gastric epithelium, but occur only in that part of the stomach which is inhabited by the protrusive epithelium.

By feeding rats on the cockroaches or by giving them ova of the nematode to eat Fibiger was able to produce varying growths in their stomachs and occasionally cancers. He published a further paper in 1920 in which it was pointed out that the embryos of the worm having been hatched in the cockroach pass to the muscles of that insect and there encyst themselves. When the rats eat the cockroach the embryos are set free. Fibiger took rats and fed them on various forms of this worm and then examined 116 of them which had survived for periods of 30 to 298 days. The stomach of each was examined in serial section. None of the rats which died within 44 days of the infection showed any signs of cancer. Of the rats which survived from 44 days up to 268 days no fewer than 51 showed quite typical carcinoma of the squamous-cell type in the gastric cul-de-sac. In the remaining 48 only benign proliferations and tumours were found. These are almost invariably produced by the spirontura.

Of the rats which died with gastric cancer in from one and a half to three months after injection of the infected material 20 had very small tumours, but 5 had multiple carcinomata; of 26 which lived for from three to ten months 18 had tumours of fairly large size and 8 had minute nodules while 15 had multiple cancers. Finally 8 rats which lived for prolonged periods had large tumours. These tumours, too, set up metastases which as a rule tended to be localized in the animals' lungs.

Cancer of the stomach had up till 1920 been produced in 89 rats. This work was also reproduced in his cancer of the colon.

In this latter case 217 rats were experimented on, care being taken to obtain mixed breeds. A relatively small number of rats developed inflammation of the tongue and a still smaller number got cance: the first appearance being in a few days after the infestation with the spirontura and in the great majority of cases was spontaneously cured in from two and a half to six months. It attacked all parts of the tongue; there was thickening of the epithelium of the organ. The tumours produced were similar in their production to the tongue found in human beings. The cancer persisted after the inflammation and all signs of the spirontura had vanished.

In his work Dr. Fibiger mentions that there is no indication that this work should now appear to be a method of starting cancer de novo and so of studying it from its origin. Another parasite, cysticercus, has for many years been associated with the appearance of sarcoma in mice. Only one rat, of 500 examined at Copenhagen, was found to show a cysticercus sarcoma, and this curiously enough was one of Fibiger's animals. It was also infected with spirontura and had, in addition to a sarcoma, a carcinoma of the stomach. Thus two different worms were able in the same animal to cause two different and well-recognized types of tumour. At least 90 per cent of sarcoma of the liver of rats are said to contain cysticercus, and in these animals sarcoma far outnumber carcinomata. In mice, on the other hand, though the cysticercus is frequently found in the liver, sarcoma are very rare. Therefore, it might appear that from the above dangerous conclusions on the subject may be. On the other hand there can be no doubt that Fibiger's experiments do throw a new light on a very baffling problem.

CANEVA, CARLO (1847-1911), Italian general, was born at Tarcento (Friulii) in 1845. His birthplace was under Austrian rule until 1866. Caneva was educated at the Military Academy at Wiener Neustadt, but he entered the Italian army on May 1 1866. In 1892 he attained the rank of colonel on the general staff, and he was promoted to major-general two years later. He served in the African campaign of 1897, and in 1902 was promoted lieutenant-general. After commanding a division and an army corps, he became sub-chief of the general staff and in 1910 he was chosen to command an army in the event of war. The event came a year later, with the outbreak of war between Italy and Turkey; Caneva commanded one side in the much-discussed manoeuvres of 1911, his opponent being Cadorna, and the former was declared victor, though military opinion was divided. In any event, it was probably owing to the result of the manoeuvres that the selection to command the Tripoli Expeditionary Force fell upon Caneva rather than Cadorna. Caneva was given a thankless task. He was sent to occupy the coast towns, and he believed that he could finally commit the Italian occupation, and that the Turkish garrison unsupported by the tribesmen could be brought to surrender with little or no difficulty. He was speedily undeceived, and the initial over-confidence was succeeded by a period of excessive caution. For a time Caneva could do nothing, as he had no transport, and later on he was hampered by orders from home which forbade risks or heavy casualty lists. But even allowing for his handicap Caneva was generally considered to have carried the waiting policy too far and clung to it too long. Although the late spring and summer of 1912 saw a change, and several important successes were gained, Caneva was recalled to Italy on Sept. 2, and shortly afterwards retired. He presided over the commission of inquiry into the Caporetto disaster in 1917.

CANTEEN, a generic term for the building and organization which provides for the soldier's recreation and extra-regulation comforts. The use of this term has naturally been extended to cover similar buildings and organizations which provide the same services for factory workers and others who live and work together in considerable numbers; but here it is sufficient to deal with canteen organization and its results in the British and American armies during the World War.

The effect in the North American field of the armies in the field to mitigate campaign hardships by canteen organization reached its highest point in the American and the British armies. The American organization was chiefly in the hands of the American Y.M.C.A. (which was also entrusted with the educational work in the American army). The British organization was, as regards the home camps, chiefly in the hands of the army and navy canteens, the Y.M.C.A., the Church Army and the Salvation Army; as regards the armies abroad in the hands of the Expeditionary Force canteens and the private agencies mentioned, whose personnel in the field were given the right to wear uniform and to use military transport and billets.

As regards the British army, the Expeditionary Force canteen in 1914 was a vast organization operating in every theatre of war. It provided for officers and men cheap shops, good rest and recreation centres, and for officers excellent hotels. From the Expeditionary Force canteen it is said that there were served in one month 1,000,000 cases of roast beef, 1,000,000 cases of suet puddings, 300,000 cases of puddings, 200,000 cases of cakes and puddings, and 100,000 cases of wine and beer. Cocktail hour was bought duty free, under some restriction.
functions, but its canteen business alone made it by far the biggest single business connected with the war. The Y.M.C.A. supplied all the 'free' canteens, and the 'free' canteen system, with its brisk trade in cards, stamps, and various small luxuries, was a great moneymaker.

The organization of the Expeditionary Force canteen was taken from the French model under the name of the Service des Canteens. The French canteens were open to all, and the quality of the refreshments was the best procurable, but the profusion was such that the 'military' canteen tended to be a luxurious substitute for the ordinary home conditions. This was the case in France, in Flanders, and in Egypt. It may be that the very highest standards of canteen refreshments were not aimed at in these cases, but it is certain that the best food procurable was made available at prices which could be paid by soldiers, and that a high standard of attention to comfort and cleanliness was maintained. The French canteen was always furnished with the best quality of food, and this was at the cost of the soldier, who paid for it out of his own pocket money or out of the small sum which he was allowed as pocket money. The French canteen was therefore a greater burden to the soldier than the British canteen. In France, where the troops were used to the best of what was available, the French canteen was an easy matter to use, and it was a great comfort to the soldier. In Egypt, where the troops were used to the worst of what was available, the French canteen was a great comfort to the soldier. The French canteen was therefore a greater burden to the soldier than the British canteen. In France, where the troops were used to the best of what was available, the French canteen was an easy matter to use, and it was a great comfort to the soldier. In Egypt, where the troops were used to the worst of what was available, the French canteen was a great comfort to the soldier. (save that a provincial councillor must live in the province in which his constituency is situated). Under this provision in the Cape province natives and other non-white races possess the provincial franchise. At the 1917 registration there were 150,000 white and 30,000 coloured electors. The number of constituencies are also the same as for Parliament. The provincial council has powers of legislation on subjects specifically assigned to it by the Act of Union and on subjects delegated to it by the Union Parliament. These powers include direct taxation within the province in order to raise revenue for provincial purposes and the control of municipalities and other local bodies, and of “elementary education” —which embraces all education other than university. Its enactments are called ordinances, and no ordinance is valid so far as it may be repugnant to an act of the Union Parliament. In short, though a legislative body, the provincial council exercises no authority which Parliament cannot revoke. There is no separate judiciary, or police force, or civil service, nor any separate departments of general government. Moreover, harbours and railways are under the control of the Union Parliament.

The provincial council is presided over by a chairman, elected from its members; and the council also chooses an executive committee of four, who need not be members of the council. The chief executive officer is styled administrator and is chosen by the Union ministry; the administrator is appointed for five years and is irremovable. A provincial auditor is also appointed by the Union ministry and is removable only for reasons which must be submitted to the Union Parliament. The Union ministry likewise appoints an attorney-general as legal adviser.

Revenue.—Under provisions of the Financial Relations Acts of 1913 and 1917 the Union Government pays to the provinces an annual subsidy amounting to one-fifth of the estimated normal provincial expenditure for the year. This financial dependence of the provinces on the Union Government emphasizes their subordinate position and is a guarantee against any tendency in the provinces to the scope of local self-government.

The subsidies paid to the Cape provincial council varied from £362,000 in 1913-4 to £999,000 in 1917-8; the revenue raised by the province was £305,000 and £426,000 respectively in the years named, but had been as low as £166,000 in 1911-5. Transfer duties and licences (trade, liquor, motor, etc.) were the chief sources of revenue. The chief item of expenditure is on education; thus in 1913-4, out of a total expenditure by the provincial council of £1,142,000, the sum of £853,000 was spent on education. In 1915-7 the figures were:—total expenditure £1,477,000; on education £1,150,000. In 1920-1 the cost of education had risen to £1,163,000, the cost of education from the school fund being £242,000, an increase of about £50,000 since 1913. In primary schools education is free.

History.—Politically the Cape province has had no separate history since the establishment of the Union in 1910. Parties in South Africa are not divided on provincial lines; it may, however, be recorded that the majority of the Cape members of Parliament have favoured the maintenance of the British connexion and the fusion of Dutch and British interests. In the rebellion of 1914 De Wet in his effort to reach German S.W. Africa entered the province and was captured at a place 110 m. W. of Mafeking. In domestic concerns the province showed a progressive attitude, notably in its care for education. Bilingual requirements gave rise to no great difficulty, the provincial council having passed an ordinance in 1921 providing that the medium of instruction up to standard IV. should be the “home language” of the child. Provincial spirit remained keen, but the white inhabitants of the eastern district, who are largely (if not mainly) of British descent, look to the Transvaal and Free State for trade, while with the people of the western part of the province (who, Cape Town apart, are predominantly of Dutch origin) they have practically no commercial intercourse.

Sir N. F. de Waal, who had been colonial secretary in the last ministry of Cape Colony, was the first administrator, and he guided the province through the period of change caused by the establishment of the Union. He served for two successive periods and was reappointed for a third time in 1920. There was no introduction of party politics in the provincial council (as happened in the Transvaal province).

The period 1910-20 witnessed considerable industrial and agricultural development and a significant growth of Ethiopianism and trade unionism among the native and coloured people. These were not features peculiar to the Cape province, though, as the Cape contained a larger proportion of educated natives and there was no colour bar to the exercise of the franchise, the province was the chief centre of native agitation for social and industrial rights. An indication of the activity of the Anglican Church was the creation of two new dioceses, George (1911), and Kimberley and Kuruman (1912).

An event which caused a deep impression on the public mind was the epidemic of influenza in the autumn of 1918. It was estimated that a quarter of the inhabitants suffered and for three or four weeks business in the cities was dislocated, so numerous were the victims.

CAPES, BERNARD EDWARD JOSEPH (1854-1918), British novelist, was born in London Aug. 30 1854 and educated at Beaumont College. He was a nephew of John Moore Capes, a prominent figure in the Oxford Movement, and was brought up a Roman Catholic. Originally intended for the army, he was prevented from taking a commission by a mistake as to the age at which he should have presented himself for admission to the Army. He was then put in the business part of his father’s office and for some years struggled with un congenial work, finally abandoning it to study art at the Slade School, London. In 1888 he joined the publishing firm of Eglington & Co. and succeeded Clement Scott as editor of The Theatre. In 1892 the firm came to an end, and he made an unsuccessful experiment in rabbit farming. But in 1896 he won a prize offered by the Chicago Record for a novel of mystery and—henceforth devoted his energies to fiction. His novels, 36 in number, were mostly tales of adventure, some of them historical. They include The Lake of Fire (1886); From Door to Door (1900); A Joy of Italy (1901); A Romance of Life (1906); The Southward Hap (1907); and The Month of May (1916). He published also a volume of verse. He died at Winchester Nov. 2 1918.

CAPE TOWN (see 5,252), capital of the Cape province, and seat of the legislature of the Union of South Africa. In 1913 Cape Town municipality was greatly enlarged by the absorption of the suburban municipalities of Green Point and Sea Point, Woodstock, Maitland, Mowbray, Rondebosch, Claremont, Kalk Bay and Muizenberg, with Camps Bay and other adjacent areas. Cape Town thus extends across the Cape Peninsula from Table Bay to False Bay at a distance of 17 m.—and covers an area of 182 sq. miles. Wynberg (between Rondebosch and Muizenberg), though retaining a separate municipality, is a suburb of Cape Town. The population, including suburbs, 170,683 in 1904 (44,203 whites), was 161,579 in 1911 (85,442 whites and 76,137 coloured). In 1918 the white pop. was 99,693; the coloured (estimate) 82,000.

Business, professional and official life is concentrated in Cape Town and at the docks. The chief feature of the decade 1910-20 was, however, the development of the suburbs, an enterprise in which the municipality took the lead. Cape Town in the season (Oct.–March) is the principal pleasure resort of South Africa, as the sea front at Table Bay a promenade pier (1,500 ft. long) and esplanade (1,000 yd.) were completed in 1914. The pier replaces the old central jetty and is in line with Adderley Street and Government Avenue, the principal thoroughfares. To the Houses of Parliament in Government Avenue, a new wing was added (1910). At the foot of the Avenue is the site of the National Art Gallery. The Max Michaelis collection of Flemish and Dutch masters—including examples of Rembrandt, Frans Hals, Jan Steen and many other masters—was presented in 1911 to the College of Art in the Old Town House, in Greenmarket Square. The building, a fine example of colonial Dutch 18th-century architecture, was transferred to the Government in 1916.

Rondebosch, 5 m. from the centre of the city, is the chief residential suburb. It contains Groote Schuur, formerly the property of Cecil Rhodes; since 1910 the official residence of the Prime Minister. The University of Cape Town (1918) is on the campus of the South African College (founded at Cape Town 1829) as the university of Cape Town, a site for new buildings—to replace those in the centre of the
City—was granted in the grounds of Groote Schuur; $300,000 towards buildings on their site by Sir Julius Wernher and Mr. Alfred Beit. In 1912 a Rhodes memorial was unveiled at Groote Schuur by Earl Grey (a former director of the Chartered Company). In front of the memorial, a granite temple in the ancient Doric style of the great temple of Jove at Olympia, stood in the equestrian statue of "Physical Energy" by G. F. Watts. In the temple is a bust of Rhodes. Not far from Rondebosch, at Kirstenbosch, are the National Botanical Gardens, established 1913. In Cape Town, in 1918, there appeared from ground zero of influenza 7,000 deaths occurring in three weeks. In the autumn of 1919, influenza, in millions of cases, killed. The city was the second in importance to Durban among South African seaports, but it is first for passenger traffic. The shortage of shipping did not greatly affect Cape Town until 1918. In that year the total tonnage of cargo landed, shipped and transhipped at Table Bay was 1,490,700 tons, an average for the three previous years being over 1,440,000 tons. In 1918 the net tonnage of shipping entering Cape Town was 2,547,000—British, 1,662,241; foreign, 884,776. In 1919 British shipping had increased to 2,253,000 net tons, while foreign shipping fell to 424,000 net tons.

In 1918 the ratable valuation of Cape Town was £21,258,000; municipal revenue £778,000, and indebtedness £4,893,000. In 1919 the ratable valuation was £23,343,000.

Direct communication with the railways of the S.W. Protoscoral (ex-German S.W. Africa) was opened in 1915 and in 1920 the railway going north had reached Lualaba (Upper Congo) at Buluwa (Victoria). In 1922 the railway was opened without a break in the gauge:

An aerodrome on the Trans-Africa air route was laid out at Young Field, Wynberg, in 1919, and the first airmen to cross the length of Africa, Lieut.-Col. Sir H. A. Van Rynveld and Flight-Lieut. B. G. Bullock (ex-Air Ltd.), arrived at Wynberg on March 30, 1920. A wireless station at Slag Kop, 28 m. S. of Table Bay, was opened in 1911. It has a normal range of 450 m. by day and 1,500 m. by night.

CAPITALISM.—The meaning of "capital," in economics, is analyzed in the earlier article under that heading (5,278). But the working of "capitalism" or "the capitalistic system," as such, had by 1921 become so highly controversial a question as to require here more detailed examination.

The term "capitalism" is generally applied to the system under which the instruments of production are the property of private owners, who usually employ managers and manual workers to carry out production by their machinery. By production we must include, if this definition is to be correct, the whole of the process by which raw materials are brought to the place of manufacture and worked up into manufactured goods, and the manufactured goods are then distributed to the places where they are wanted and sold to the final consumer through the hands of retailers. The instruments of production thus include not only the land, factories, tools and machinery, and other equipment used in actual manufacture, but the railways, ships and other means of transport, and the warehouses and shops through which the goods finally pass to the consumer.

The instruments of production have not been universal in man's economic history, but it has been generally adopted by progressive communities. When "Adam delved and Eve span," they were "capitalists" in the sense of owning a spade and spinning-wheel and using them for purposes of production; but they used these tools themselves and for the purposes of supplying their own needs. And at a very primitive stage of society, this simply individualistic system by which the capitalist used his own tools and worked for his own needs may be presumed to have been common. When, however, by the development of a wider society the desire to dispose of the products of labour and the exchange of goods between one member and another of the community became to be practised, the new feature arose by which the producer made and grew goods not only for his own use, but to be exchanged for goods grown or produced by others; and consequently he had to produce something which somebody else wanted if he wished to provide for his own needs to his own satisfaction. Thus we find in the Middle Ages artificers and craftsmen owning their own tools, that is to say, their own capital equipment, and working to produce articles such as armour, farming implements and clothes which they exchanged in return for the food produced by the farmers who worked at Table Bay was a system, traced by the artificers if they were of a kind which pleased their fancy. It is important to note at the outset that the capitalist, whether he works with his capital or sets others to work with it, must invariably direct the work done so as to suit the wishes of a buyer which may or may not be expressed before the making of the article is begun. Capitalism, in the sense of a private ownership of tools and equipment, thus dates from the earliest organization of human economic activity. As soon as a savage had given time and labour to fashioning a weapon with which he could more easily kill or catch animals that he hunted for food or clothing, he had become a capitalist; he had made something which would help him to provide for his own needs and those of his dependents more easily, or by which he could more easily acquire commodities which he could exchange against those owned by other members of his tribe. But capitalism in the modern sense, and as defined above, is usually said to date from the last quarter of the 18th century, when what is called the "Industrial Revolution" began, and by the inventions of machinery and the use of steam industry was reorganized on a new basis.

Capitalist and Worker.—Owing to these developments it was no longer possible for the workman using his own tools and working in his own home to compete with workmen who were assembled in a great factory and worked with machinery which it would not have been possible for their collective resources to buy. Thus arose the distinction between the worker and the capitalist, who had in effect already made considerable progress before the introduction of machinery, but was so rapidly developed after it that modern capitalism is usually so dated. By "system the term the instruments of production, by which is generally understood. This manual worker, is said to have been divorced from the ownership of his tools. The scale of industrial organization became so great that it was only possible for men of great means, or for a collection of people of considerable means, to provide the necessary land, factories and equipment for its working, and also to buy the large quantities of raw material required, to pay the wages of the multitude of workers and managers, and to finance the other expenses during the process of production and up till the time of payment of the final purchaser.

The capitalist who owned these factories, whether individuals or small bodies working in partnership, to act as managers of the whole concern. The capitalist was at once owner of the factory and machinery, provided the money needed for the financing of the industrial process, and managed and organized the whole enterprise. He was responsible for buying raw materials, paying wages and selling the product to the greatest possible advantage to the other capitalists, merchants and middlemen, who passed it on until it reached the final consumer; he, singly or in partnership, took all the risk of loss involved if the product failed to suit the caprices of the buying public, and took the profit if any, that was earned from the enterprise. This profit was included interest on his money invested, the payment of his salary as organizer and manager, and any extra bonus which his skill might enable him to earn as compensation for the risks run.

Joint Stock System.—As industry developed on a still greater scale it was not possible for this comparatively simple organization to be maintained. When it became a question of building railways, requiring hundreds of millions to finance them, no individual or partnership could supply the necessary funds, and so the joint stock system, which had already been developed on a small scale in mediaeval times, was extended so successfully to industry that the greater part of our industrial activity is now carried on by means of joint stock companies, the extension of which was enormously facilitated by the introduction of the principle of limited liability. Thus the position of the capitalist has become still further defined and differentiated. It is certainly probable that the managers of most of our great industrial concerns hold a certain number of shares in the business which they conduct, and to that extent may be described as capitalists, but the two functions are now quite distinct. The capitalist pure and simple lends money to industry or invests it in industry, leaving the working of the enterprise to be done by others. The actual management is carried on by officials appointed specially for this purpose under the supervision
of a committee of the shareholders who are called directors, who are paid comparatively small fees for the usually rather nominal supervision which they exercise over the more highly paid work of the managers and staff, and for guiding the financial policy of the company with regard to dividend distributions and so on. The capitalist is either a creditor or a shareholder in the company which is formed by public subscription to carry on the industry in question; all that he does is to lend to industry the money which is essential in order that the industry may acquire all the tools, machinery, buildings, raw materials and other equipment necessary for carrying on the work, and to pay the wages of the wage-earners and managers during the initial period before the company's operations have produced something that can be sold to supply money for wages, the purchase of further raw materials, and the upkeep of the plant. The business enterprise is carried on by highly paid experts, and the capitalist's sole claim to a share in the earnings of the company is based on the fact that he has provided the money which was essential for its beginning and for its further growth. He earns his reward first by placing this money at the disposal of industry instead of spending it on his own immediate enjoyment; and secondly by risking the loss of part or the whole of his money if the industry should fail.

Capital Financing.—A highly ingenious machinery has been developed for the provision of money for industry and commerce by the process of investment in the securities of public companies, and for the turning of these securities back into money by their sale in markets known as stock exchanges. Joint stock companies are formed either to carry out some new enterprise, or work some new process, or to take over an existing business which has hitherto been carried on by private partners. An appeal is therefore made to the public to subscribe to the securities into which what is called the company's capital is divided. As so often happens in these matters of business, great confusion arises owing to the use of the same word in different senses: the capital of an industry has hitherto been referred to in the course of this article as the tools, buildings, and other equipment by which industry works; but the capital of a company generally means the money that it receives from those who subscribe to the securities that it offers. If we take the case of a company formed to work a coal mine, and suppose that the original promoters consider that £2,000,000 will be necessary for them to make a proper start on the enterprise, then these two millions will be the original capital of the company, subscribed to it by investors who receive, in return for their money, securities which give them claims upon it for interest, dividends and repayment either at a fixed date or in the event of the company's liquidation. These claims take the form of securities issued by the company. They would probably be divided into different classes, which in ordinary cases will be a debenture stock, perhaps carrying mortgage rights and entitling the holders to a fixed rate of interest, and most probably to repayment in full or at a premium at some future date. In case of default in payment of their interest or repayment of the sums promised at the due date, the debenture-holders would be entitled to take over the property and put it in the hands of a receiver. They are thus not shareholders in the company but its creditors, and, strictly, securities issued in this form of a mortgage or debenture are not part of a company's capital but its debt. Ordinary business ventures, however, usually includes mortgages and debentures as part of capital. The share capital is usually divided into preference and ordinary, the preference shareholder being entitled to a fixed rate of interest which has to be paid to him before the ordinary shareholders receive anything. This preference right among English companies is usually what is called cumulative, that is to say, if the preference dividend is not paid in any year all arrears have to be paid before the ordinary shareholders receive any return on their investment. In America, however, where the term 'preferred' rather than 'preference' is more usual, this cumulative right is not so common as it is in England; in some cases also preference shareholders are entitled to a further participation in profits after a certain rate of dividend has been paid to the ordinary shareholders. The ordinary shareholders as a rule take what is left of the profits after the claims of debenture-holders and preference shareholders have been satisfied. If the company is successful they thus earn higher rates on their investments than go to the holders of other forms of securities. If the company fails they receive little or no profit, and the claims of the mortgage and preference shareholders have to be satisfied in full before the ordinary shareholders get any of their capital back in case of liquidation. Almost infinite variations, however, are performed on the theme of capital arrangements, with income debentures, cumulative ordinary shares with a fixed rate of dividend, deferred shares, founders' shares and so on. And some companies issue no securities except ordinary shares or stock.

By this ingenious system the amount of risk involved by industrial investments can be varied to suit the taste of the individual investor. It is usually invested in inverse proportion to the risk he takes; the less risk he takes the less return he is entitled to on his investment. The holder of a debt which is a first charge on a long-standing and well-managed industrial or transport concern comes as near as he can to eliminating risk altogether from an industrial investment. It consequently follows that this kind of security is originally issued and is dealt in on the markets of the world on terms which give their subscribers or purchasers a comparatively low rate of interest. The preference shareholder, who is not as well secured as the debenture-holder, but ranks before the ordinary holder, also stands midway between them in the matter of risk and the matter of return. Before the World War, for example, if a well-known English brewery company were appealing to the public for subscriptions it would probably have been able to issue its debenture stock in return for a promise of 4% to 4½% its preference shares on the basis of 5% to 6%, while its ordinary shares, if they were to expect a ready response from the public, would have had to show a probable return of 7% or 8%.

When the prospectus has been issued and the public subscription has been carried out, the securities offered are then quoted on the Stock Exchange at prices which will vary with the opinion held concerning the present and prospective prosperity of the company, and also in accordance with the general rate ruling for the use of money, which varies like the price of everything else in accordance with supply and demand. At a time when there is a great demand for capital for the development of new and old enterprises all over the world the rates that have to be offered in order to tempt subscribers will be forced up by competition, and consequently the price of existing securities will tend to fall owing to sales by their holders, who are tempted by the more alluring rates offered by new ventures. If, on the other hand, enterprise is slack and new creations of capital are comparatively rare, then the pressure of accumulating savings for the purposes of business enterprises will be less, and the price of securities with a fixed rate of interest or dividend naturally fluctuate less than those of the ordinary shares, but even in their case the success or failure of the company has a very considerable influence upon the price for which they would be sold. Many popular securities have a world-wide market and can be dealt in all the financially civilized countries; and this development of securities readily marketable at publicly quoted prices has been a great assistance to the growth of international banking.

Freedom of Enterprise.—By the development of this machinery it is possible for the association of small contributions by a large number of people with comparatively small means to carry out enterprises on a colossal scale, and to pour the stream of investment into all the countries of the earth, fertilizing its backward
places and bringing forth a vigorous crop of goods and services and making the world into one great market united by the bonds of industry and finance. In many large industrial companies nowadays, shares of £1 each or less are now issued, and in this way capitalism has been democratized to an extent which a hundred years ago would have been thought impossible. Enormous enterprises, the most obvious example of which are the Egyptian pyramids, have been carried out in the past by means of slave labour employed by tyrants; and the Roman roads and aqueducts are another example of what could be done by the application of state management to a highly disciplined people. But the most notable achievement of modern capitalism is that it has vastly increased the productive power of mankind by making use of the resources of thousands of individuals voluntarily subscribing their money in the hope of profit which can only be earned if the consumer-purchaser will voluntarily buy the goods and services produced. Thus capitalism is essentially based on freedom—the freedom of the subscriber in risking his money, and the freedom of the consumer in giving or withholding his custom and the profit that it makes possible. It opens its pockets freely—sometimes too freely—to anyone who can persuade it that an enterprise is likely to be profitable. Under it the way is open from the bottom of the ladder to the top for those who have the diligence, determination, capacity, and luck to climb; and they can climb only by producing something that will fetch a good price in the market of their fellow-creatures' needs and desires. The freedom that he was able to describe a state of affairs from which the consumers' veto. It can only succeed by pleasing the ultimate buyer and cooperating with the consumer by satisfying his needs.

Prejudice against Capitalism.—Nevertheless, capitalism is perhaps now more virulently criticized than any other human institution, largely owing to the belief that it involves robbery of the wage-earning classes by those who place the means of production at their disposal and pay them wages for working upon them. The prejudice against capitalism could not be as wide as it is unless there were some foundation for it; and in the first half century in which modern capitalism was active the exploitation of the wage-earners through low wages, long hours, disgraceful working conditions and ruthless dismissal at any time when it seemed more profitable to the employers to reduce output, was carried on to an extent which is now seen to have been criminal. This seems to be the reason for the astonishing hold which the works of Karl Marx have exercised upon those of the wage-earners who are attracted by his revolutionary doctrines. It is admitted by Marx's most fervent admirers that most of his theories were wrong, that many of his assertions were incorrect, and that most of his forecasts have been proved to be baseless. But it has also been shown that he has made a number of things in English industry on the authority of official documents which was entirely disgraceful; and the wage-earners, who probably seldom study his works but usually rely upon a summary of their contents, find that with regard to the exploitation of the worker he has a solid basis of facts which are known to them by the tradition they have received from their forbears who worked under the miserable conditions that he describes.

It need not be said that since the middle of the 19th century there has been a very great change in this respect, thanks to the advent of trade unions, which were organized to be the representatives of those most interested in the condition of affairs, and were thus able to do something for the wage-earners. In the first place, we must remember that a very large number of them in those days were men who had risen from the ranks and had themselves had to suffer the hardships which they imposed on others, and, since they had come through them successfully, did not see any reason why anything better should be done for those who worked under them. But a further excuse has to be found for the men of noble lineage and high intellectual attainment, who also suffered barbarities to be perpetuated in the mines and factories which they owned; and this excuse is provided by the pessimistic utterances of economists such as Adam Smith, Malthus and Ricardo, who stated or implied that the pay of the wage-earners could not rise above the level required to maintain them as efficient workers; and that any wages above that level would necessarily imply an essential injustice in the system or any blots upon it which cannot be improved out of existence. If the early employers, taking advantage of the unorganized state
of their workers, paid them too low for too long working days under working conditions which were a disgrace, it is also true that these conditions are in most industries, especially the best organized and most prosperous industries, a thing of the past. Moreover, the charge against capitalism, brought against it by the most extreme of its critics, is not merely that it has been in the past or is now unjust to those who work for it in the matter of hours and wages, but that the whole system is essentially based upon robbery, that the whole product of industry is really due to the exertions of labour, and that any interest or profit taken by the capitalist is necessarily a form of robbery. It is not a true man of degree—that the capitalist has not taken the product he is entitled to—but that the capitalist is not entitled to take anything at all, and that anything he takes is essentially a theft.

Labour's Capacity.—For this contention it is very difficult to find any real ground either in fact or in theory. Labour, in the sense of manual labour, by itself can effect nothing. Put down the most skilful hand-worker on a bare piece of ground and he cannot produce anything out of it until he has made himself tools and so become a capitalist; and, in the meantime, he would somehow have to feed himself on any roots that he could dig up, or any wild animals that he might be able to kill. Even if we insist upon labour the immediate nature of its existence remains true that any body of skilled workers, organized as well as possible under the most skilful management, would be equally ineffective without the assistance of the factory, tools, and other equipment which have to be supplied out of capital, that is to say out of the accumulation of past savings, before they can produce effectively. Labour by itself can effect nothing industrially or commercially; labour plus management is equally powerless. Capital by itself is, of course, in exactly the same position. Anyone who through the possession of capital owns a large supply of raw materials, and the necessary land, factory and equipment, he can make nothing out of them without efficient management and efficient manual labour. These truisms are usually acknowledged by the extremist advocates of labour's claim to what is called the whole of its product. They admit that labour must have machinery and tools to work with; but Mr. Philip Snowden, for instance, the English Labour M.P., has contended that "the existence of a rich class who do no labour is the conclusive proof of the claim that labour does not receive all that labour creates, but that a surplus over and above the wages of labour is appropriated in some way and some form by those who do no work." But this merely gives the whole question a new twist, and "labour creates" all that labour produces with the help of machinery. It seems to be based on a confusion of mind which imagines that because the machinery and equipment by themselves can produce nothing, therefore, those who work them and make them efficient are entitled to everything that is produced by their own efforts assisted by the machinery. In fact the existence of the machinery, which has been provided by the possibly idle capitalist, enables the manual workers to produce goods of an immeasurably greater volume and value than they could turn out without it. If labour is entitled to the whole of its product, as it surely is, it is also true that labour gets the whole of its product and a very great deal more, because, owing to the assistance given it by the machinery and equipment provided by capital, it is able to produce a very much greater volume of goods, and the bargain between it and capital results in its being better off than it could have been without capitalism's assistance.

To take an obvious example, let us suppose a man in a primitive stage of society to have hit on the idea of making a spade, and so greatly increasing his own production of food. If he then makes a second spade and lends it to a friend, enabling the latter to multiply his production and charging him a portion of the increased food for the use of the spade, then we see a rough analogy of the bargain which under capitalism is struck between capital and labour. In this case the friend who borrows the spade works for the capitalist who lent it, but he also works for himself. By the use of the spade his production is multiplied manifold; and to argue that he is entitled to take the whole amount of what he produces with the assistance of the spade, and that the man who invented and lent him the spade robs him by taking part of the increased production which it brings into being, is surely an example of astonishingly distorted logic. At the same time it has to be remembered that those who claim the whole product of industry for the manual workers can say that all the factories, means of transport, tools and machinery have actually been erected or produced by manual labour. But this manual labour, and the skill which organized it, were paid to produce these instruments by owners of wealth who were prepared to risk it on these objects. All these forms of the equipment of industry only came into being and increased the numbers and magnitude of the whole community because some of those who controlled wealth when they were first invented used it to secure their manufacture and production instead of upon their own immediate enjoyment. At any time the future development of any country or community depends upon the extent to which its members are prepared to postpone immediate enjoyment to the provision of equipment for its further progress. If some of our ancestors had not made investments in industry in the past, and so equipped the world with all the machinery of industry and commerce, probably not half of us would now have been alive. Interest and profit are thus the reward paid for successful investment in the means of the life, with which we are all share.

Means of Production.—Critics of the capitalist system are, at first sight, on firmer ground when they argue that it is wrong that anybody should possess, by the ownership of private wealth, this responsibility for the future development of the country or community; that injustice arises because private ownership makes it difficult and sometimes impossible for those who want to work to secure access to the means of production, and that a more equitable basis would be arrived at if all the means of production were owned by the state, or by some other public body, or, as is now contended by the syndicalists and guild socialists, by the industries which employ them organized into an all-embracing trade union or guild.

There can be no question that the existence of private property in the means of production does involve hardships and difficulties for those members of the community who do not happen to be born into the possession of property, or of the kind of qualities which enable them to acquire it rapidly. To such people, the ordinary unskilled workers, it must naturally seem unjust that if the kind and quantity of work that they offer to any private employer is not needed, some of them find great difficulty in earning what are reckoned to be necessary for the care of their dependents. And the question that we have to consider is whether the hardships involved to a comparatively small number of the less fortunate members of the community are balanced by the advantages to the community as a whole involved by the working of the capitalist system. Under that system anybody who by ingenuity and energy can earn more than his fellows is enabled and encouraged to do so and to devote his accumulations to the furtherance of industry by putting them out at interest, or engaging them in enterprises from which he hopes for profit. There is consequently a continued stimulus for activity and exertion, and it must always be remembered that this activity and exertion can only be successful if it produces something with which the community, as a whole, or a sufficient number of its members who are in a position to buy goods and services, are satisfied.

Thus, by this stimulus, the wants of the community have been continually considered and cared for by its most enterprising members, who are urged to do so by the hope of gaining profit. If this stimulus were taken away, it is at least possible that progress would be very greatly retarded and that the interests of the community, as a whole, especially those of its poorest members, would be seriously affected. It has to be admitted that the wants of the community are not always wholly sensible and are very often marked by highly questionable taste. These drawbacks are surely to be best remedied by the education of the community to a more sensible and tasteful use of the power that it has by its decision, through the manner in which it spends its money, concerning the goods and services which are turned out by industry. If the decision as to what is to be produced is to be
in the hands of a bureaucratic committee, as under state socialism, or of a guild or trade union committee, as it would apparently be under guild socialism or syndicalism, then it is perhaps possible, though highly doubtful, that the objects on which the productive enterprise of the community would be exercised might be most sensible and tasteful; but the general accord of the community, having no power of choice, would not be exercising sense or good taste, but would merely be taking, whether they liked them or not, goods and services provided by the decision of an outside body.

Advances under Capitalism.—A more serious doubt arises whether under any alternative system that has yet been suggested the actual needs and necessities of the community would be successfully met. We have to admit that under capitalism there has existed and still exists a great deal of destitution and poverty which are serious blots on the success of the system. On the other hand, anybody who takes even a superficial and cursory view of the productive progress of the last century and a half under modern capitalism must admit that an enormous advance has been secured. There is no need here to enumerate all the miraculous inventions by which man's power over nature has been increased, and his productive capacity has been enormously multiplied. The extent of these powers was only fully realized when the World War came, and, in spite of the view expressed by some economists that a modern continental war could not last more than a few months because the economic strain would be too great, it is evident that the state would have to carry the war on for more than four years, to develop the production of lethal weapons during its course on a scale which has never heretofore been dreamt of, to feed and clothe the armies in the field much better than armies in the field had been fed and clothed before, and, at the same time, at least in England, to increase the standard of comfort of the greater part of the population. These achievements were in fact only carried out by making drafts to some extent upon the capital resources of the countries engaged, as, for example, when England sold back to the United States her imports of coal and raw sugar, and such exchanges of each country's surplus wealth with munitions of war, which she was importing from America. But, when full allowance has been made on this score, the fact remains that the World War demonstrated a growth of productive capacity which had not been suspected until the supreme test aroused the energies of all the chief nations of the world.

But, apart from this astonishing effort at a time of crisis, we may take the prosaic facts of the last half of the 19th century as quoted by acknowledged champions of socialism. Mr. Sidney Webb, in his Industrial Democracy, speaks of "the past fifty years as a rise in the condition of the English wage-earning class." Mr. Snowden, in his Socialism and Syndicalism, says that according to official figures between 1850 and 1900 the wages of the working classes in England had risen by 78%, and at the same time there had been a fall in the prices of wholesale commodities of 11%. This is surely a wonderful achievement which has to be granted as practical evidence of the efficiency of the capitalistic system, and of the extent to which its benefits were being shared with those who did its manual labour.

Mr. Snowden objected that the prices of wholesale commodities are not the best possible test of the buying power of the wage-earners, and that certain articles which they use did in fact rise. This may be so, but nevertheless the very great advance in actual money wages, accompanied by a quite appreciable reduction in the prices of many articles of general consumption, is a stubborn fact. This, indeed, Mr. Snowden to some extent admits, but he goes on to argue that this progress had stopped at the beginning of the 20th century, and that the tendency had then become permanent by which the share of the wage-earners in the product of industry was actually going backwards. This was certainly true in the first few years of the century, since the rise in wages, which still continued, did not quite keep pace with the rise in general prices. But Mr. Snowden's contention that this trend has been to a permanent and exaggerated underestimation of the manual workers of England was preparing a great attempt to improve their position, and there is every reason to assume that this attempt would have been successful. In any case, the war came and the general position of labour was certainly improved during its course. Since the war, the struggle between wages and prices has been somewhat difficult, but it may at least be contended that this has been due not to an essential fault in capitalism, but because the wage-earners thought fit to restrict output in a mistaken belief that they would thereby resist any attempt to force them back to the pre-war standard, which they were rightly determined to avoid.

We have also to remember that under the sway of capitalism this very considerable improvement in the wage-earners' lot has been carried out in spite of an enormous increase in population. If it be admitted that the general standard of life before the World War was not at all that it should be, it must also be admitted that the gift of life and all that life involves had been showered upon millions of people in all the economically civilized countries of the world, who could not have come into being if it had not been for the great increase of wealth under capitalism.

Weakness of the Alternatives.—One of the strongest arguments in favour of the present capitalistic system is the weakness shown by any system with which its critics would propose to replace it. State socialism has long been before the public as an alternative to the private ownership of capital. If it could be worked its economic advantages would be considerable, because it would mean that the state would own all the means of production and so would be the sole purchaser and the sole organizer and the sole distributor. The state would, therefore, decide what the needs of the community were, and how much work had to be done to provide them, and would set the members of the community to work to provide these things. All the waste involved by competition and advertisement would be saved, and all the mistakes in production would be avoided, which now arise because those who organize production have to try to foresee and forestall the needs of the public. The state would say what work each one of us was to do and what goods each one of us was to make. If it were really possible that under this system we should work as well as we work now, there can be no doubt that the business of supplying the community's needs, as interpreted by the state, would be free from many of the joltings and jarrings which now often put the industrial machinery to some extent out of gear. But, in the first place, there is the enormously important question whether such a system could work at all—whether in fact the ordinary human being, as he is to-day, would be prepared to work at the bidding of the state, on conditions laid down by the state, with anything like the enthusiasm and readiness with which people work nowadays with the prospect of securing profit and advantage for themselves. Equally, there is the great majority of commonplace people, who do not at present work with much enthusiasm or energy because they know that their own chance of achieving striking success is remote, would work for the state as well (or as indifferently) as they work now for private employers, there is very considerable doubt whether the more stirring spirits who think they can see their way to fortune in present circumstances if they work for it with determination, would put anything like the same vigour into work that they did for the state; it is upon the energy and readiness to take risks of this comparatively small body of stirring spirits in the community that economic progress really depends. If we stifle the incentives which now spur them to take risks and try experiments in the hope of fresh opportunities of profit, there is grave danger not only that the economic progress of the community might be checked, but that its whole economic organization might fall into decay and slothfulness, and that any attempt to improve or expand might be met with the same cold and unresponsive stare that now usually greets any new suggestion that comes up before officials of government departments. It might be possible in time to produce a set of officials who would be able to control enterprise and enterprise without enterprise, as are the present captains of industry stirred by the incentive of profit. But past experience does not show that there
is much hope of this happening, at any rate for many years, and in the meantime any community which subjected itself to state socialism might find itself very much worse off. It is true that during the World War great feats were achieved by government departments in organizing the supply of food and of war munitions, but they were achieved because the spirit of the nation was stirred to meet the most momentous crisis in its history; and because government departments were able to rely upon the assistance and experience of a large number of men who came to work in them, who had been trained in the school of practical business based on the incentive of private profit. And even so, these official achievements during the war were only carried out at a cost which the country could not possibly have stood except for a comparatively short time; they also involved continual friction between government departments and the wage-earners whom they employed, and their general results were so unsatisfactory that it is now a commonplace, even among labour leaders who are most anxious to nationalize industry, that whatever happens "bureaucratic control" must not be allowed to take charge. "Government departments are in the worst of bad odours just now, and nothing which seemed to involve an extension of bureaucracy would have a chance at the polls"—so writes Mr. Gerald Gould, one of the latest exponents of socialist ambitions, in The Coming Revolution in Great Britain, published in 1920. How it is possible to organize nationalized industry without bureaucratic control has not yet been shown. The exchange of their products, that is to say, of arriving at a price, and the question of the provision of further capital seems to have been left out altogether. Guild socialism seems to be an attempt to reconcile syndicalism and state socialism and to arrive at a working compromise by a compound of the two. Unfortunately, its schemes as at present expounded seem rather more likely to suffer from a mixture of the drawbacks of both systems. The guild socialists consider that the capital equipment of industry should be owned by the state, but that the whole organization of industry, the decision as to what is to be produced, and the control of the product, are to be in the hands of those who work in it with brain or with hand. Here again we have the difficulty as to how we are to arrive at a means of exchange between one guild and another. If the shirt-making guild thinks that its members ought to get a pair of boots in exchange for two shirts, while the boot-making industry thinks that a pair of boots ought to be exchanged for three shirts, who is to decide between them and what power is to enforce decision? In the exceedingly vague sketches of the guild systems that have been produced by their champions, some attempts have been made to answer these questions. But even if decided at any common denominator by the parliament representing all the guilds, a state parliament representing the consumers, and apparently yet another parliament which is to settle matters when these two parliaments cannot agree. Obviously there are materials here for economic chaos. It is true that if everybody worked with a perfectly angelic spirit such a system might possibly be able to carry on the work of production, but if everybody had an angelic spirit any system, even capitalism, would also be highly successful. But the guild socialists have to admit that, if any particular guild which was strong enough chose to hold a pistol at the head of the rest of the community by refusing to work except on its own terms, serious difficulty would arise. In fact, some of its more candid advocates have stated frankly that the wage-earners might conceivably be a good deal worse off under guild socialism; but they seem to think that a diminution in their actual control of goods and comforts would be more than compensated by the greater freedom they would enjoy, and by the feeling that they were no longer working to profit a private capitalist.

Economic Tyranny.—How much truth is there in this claim for the greater freedom to be enjoyed by the wage-earners under guild socialism? One of the principles on which its champions most strongly insist is that production and the control of the product are to be in the hands of the guildsmen themselves, and that, consequently, they will be able to insist on producing goods which they think should be produced, rather than goods which consumers would prefer to consume. One of their champions, Mr. G. D. H. Cole, even goes so far as to mention the right to "choose whether they will make well or ill" as one of the things which must be recognized. A parallel can be drawn in the state capitalism which supports the advocates of state socialism. Certainly the right to work well or ill is a very large extension of freedom of a kind, but it is likely to react in favour of freedom in the fullest sense of the word? As industry is now organized under the principle of the division of labour, every one of us produces or helps to produce one article or fraction of one article, but we consume hundreds of articles. Economic freedom, that is to say, freedom to provide ourselves with such goods as we should like to consume, thus seems to be much more real under capitalism, which gives us the right to spend our wages and salaries as we please, than it would be under state socialism or guild socialism.

State socialism would tell us what work to do and what goods to consume; and guild socialism, though apparently leaving to us, when once members of a guild, the right to decide along with our fellows concerning the goods that we will produce, and also as to whether we will work well or ill, would nevertheless leave us dependent upon the decisions of others guilds as to what kind of goods they chose to produce, and upon the inclination to work well or to meet our demands with shoddy and ill-made commodities. Since this is the kind of freedom which is held out to the wage-earners under these rival systems, there certainly seems to be good reason why they should think many times before taking a leap in the dark by adopting them.

Capitalism and Progress.—Such are the doubts and difficulties that face us when we contemplate the practical working of any alternative so far suggested to capitalism. For it, on the other hand, we can at least claim that, with all its faults, it has achieved a marvellous improvement in the command of man over natural forces; and has produced an enormously greater amount of wealth, which has been distributed, though in a manner which leaves a good deal to be desired, over a greatly increased population. Along with this purely material improvement there has proceeded a great expansion in education, sanitation and social reform. Capitalism can only lay down the general claim to the whole of this expansion, a great deal of which has been brought about, in spite of the opposition of the propertied classes, by a few enthusiasts, educational and scientific; but capitalism can fairly claim that these enthusiasts could not have done their work if there had not been available the surplus supply of wealth which was called into being by the efforts of private enterprise working with the incentive of profit. A noted labour leader has recently said that capitalism has made England a "C. S. country." But this description is more rhetorical than accurate. England's achievements during the last thirty years have been due to the fact that her armaments are produced by private enterprise, not by the state like those of her Allies and enemies, who had also developed their resources under a capitalist system, were such as to astonish those who had anticipated that the drift of the population into great towns, and their occupation under sedentary conditions, would make it difficult to find armies who could fight with the spirit in which armies fought in former days. In fact, armies were produced in proportion to the population on a scale previously undreamt of, and fought an almost continuous battle for four years, showing unprecedented courage under conditions that no armies had hitherto been asked to face. The spirit and physical power of the countries which have grown into material greatness under the capitalist system certainly show no sign of demoralization. At the same time it is true, as has already been admitted, that the blot of destitution is one which has to be
erased from the record of capitalism before it can claim to have produced a system which is really worthy of what is called civilization. If capitalism is to continue it will clearly have to remedy this evil and others which have already been mentioned. The leading spirits among those who are interested in its maintenance are fully aware that these things have to be remedied. In fact the change of attitude on this point among employers in recent years almost amounts to a revolution, though there are still too many obtrusive exceptions. Associations formed for the face-to-face discussion of these points by employers and employed are already common, and, on the side of the employers, it is certainly true that (perhaps under the spur of self-interest) they are earnestly trying to repair the weaknesses in the system which they have themselves encouraged. It has, however, come to pass that labour will not work the capitalistic system with hearty cooperation. Improved conditions, higher wages, and greater influence on problems of management, the best of them are more than ready to grant if only they can secure in return for them active work during the time when the manual labourers are engaged on their work, and the renunciation of the policy of the restriction of output. It would appear from the utterances of those who consider themselves entitled to speak for labour, such as Mr. Sidney Webb and Mr. H. H. Hyndman, that labour has made it clear that it is not going to work in future to put profits into the pockets of private employers; in other words, it is determined to end the capitalistic system. Whether the rank and file of manual workers have really adopted this extreme view may very well be doubted, but they are extremely likely to adopt it unless they can be granted greater security. This is certainly a demand on the part of the manual worker which will have to be met by capitalism if it is to survive. The anxieties of the ordinary manual worker, who does not know how soon he may be told that he is no longer wanted at his job, should always be present in the minds of the employers, and if the schemes now being mooted by which every industry should make itself responsible for its own unemployed can be brought into practical effect, there can be no doubt that one of the worst evils of capitalism will have been abolished.

Another reform on which the manual workers seem likely to insist is a clearer statement of the costs and profits of industry. At present the accounts published by joint stock companies usually only succeed in making darkness visible. Labour has so often been misled as to the capacity of industry to stand concessions to it, that employers will be well advised to produce a more reliable and complete system of accounting, by which labour is able to prove to demonstration what the true costs of industry really are, how much is required for depreciation and upkeep, and how much is taken by capital.

As to the sordid ugliness with which capitalism is usually charged, everyone who has visited an English north-country industrial town must admit that the system in its craving for cheap production has ignored many things which make life tolerable for those who work for it, and has therein shown only another example of short-sightedness for which it now has to pay. Even on this point, however, one feels that there is a certain doubt whether any alternative scheme of state socialism or guild socialism would provide the community with the necessary leisure and surplus wealth that could be devoted to the beautification of the country which adopted it, as is too usually assumed. If everybody is to have a nice house and live in pleasant surroundings, production has to be organized so as to be not only for the comfort of those who are engaged in it, but efficient in the matter of output. And, on this subject, as has already been shown, there is good reason to doubt the efficiency of alternative schemes.

Inherited Wealth.—Another of the weaknesses of the capitalistic system is the power that it gives to owners of wealth to continue to accumulate it and pass it on to their heirs and assigns, with the result that a class is created which is able to live in great luxury on the past efforts of their ancestors, relatives, or friends, without making any effort to justify their own existence. There can be no doubt that the existence of these huge fortunes, accumulating and being passed on, are a source of great bitterness among the classes which do not possess them. Much might be done to alleviate this bitterness if all the owners of such wealth, and not only a certain number of them, were careful to make a more public-spirited use of it. It is true that they owe it to the work and exertions of others who have passed on this wealth to them, but this is only partially so. A large part of it they really owe to the existence of an ordered society providing a market and outlet for the efforts of those who accumulate the wealth and a machinery for investing it and reinvesting it, and so increasing it from generation to generation. From this point of view a large part of their great wealth they owe to the community in which they live, and the assumption that it is their duty to give back something that they used to get is a notion which will cost them dear if put into practice too logically. It is possible, however, that this evil may be cured, at least to a great extent, by the development of death duties and inheritance taxes, which seems likely to be an increasingly important part of the fiscal arrangements of civilized nations in time to come. Here again, however, there is danger that if this remedy is exercised too freely the process of accumulation which is required to provide the community with capital for fresh enterprise may be dangerously checked. For the evil of huge fortunes is balanced by the fact that it is largely from them that have been won on a somewhat narrow field, on a small scale are effected; and it is highly dangerous to diminish them by the use of the fiscal weapon, before the duty of saving and accumulating has been effectually brought home to those classes of the community which are now accustomed to spend all that they earn or receive.

Need of Extended Capitalism by Savings.—The efforts made in England and America and elsewhere, during the war, to try to induce everybody to save for victory have had effects which astonished those who were most closely acquainted with the thriftlessness of ordinary human nature. The Savings Movement (see Savings Movement) has been so far from them that have been won on a somewhat narrow field, on a small scale are effected; and it is highly dangerous to diminish them by the use of the fiscal weapon, before the duty of saving and accumulating has been effectually brought home to those classes of the community which are now accustomed to spend all that they earn or receive.

--CAPORETTO, BATTLE OF--The Italian offensive of Aug.—Sept. 1917 had reduced Boroević's armies to the limit of resist-

---

1 See generally under Italian Campaigns.
ance, so much so that, as Ludendorff records, "the responsible military and political authorities of the Dual Monarchy were convinced that they would not be able to stand a continuation of the battle and a twelfth attack on the Isonzo... In the middle of Sept. it became necessary to decide for the attack on Italy in order to prevent the collapse of Austria-Hungary."

Though the Italian advance on the Bainsizza plateau had come so near to a definite break through, it had left the Italian II. Army badly placed for defence. South of Tolmino the Aug. fighting had beaten out a wide salient on the Bainsizza plateau. North of Tolmino the Italians were still in the positions they had occupied early in the campaign, among the mountains on the north bank of the Isonzo, with comparatively little room between the trenches and the river. Neither sector of the line was satisfactory for defence, and on the Bainsizza there had been little time to make adequate preparations, because of the rocky nature of the ground. But the real weakness of the situation was due to the enemy's possession of the Tolmino bridgehead.

The bridgehead itself was strong, as it did not form a salient, the Austrian line running nearly due N. and S. from the great ridge of Rudeci Rob (6,250 ft.) by Mrzli and Vodil Vrh to the high hills of the Lom plateau, N. of the Bainsizza. The bridgehead was well protected by the flanking bastions, and for this reason it made an excellent point of departure for an attack. The ridges in front of it rose steeply, and were strongly held by the Italians, whose position, however, suffered from two grave drawbacks. In the first place it was impossible to support the defence by direct flanking fire against attacking troops; in the second place, there was little depth in the lines traced on the Zagradan-Jeza ridge, which fell rapidly to the head of the Judrio valley and the glens which carry the minor streams between the Judrio and the Natisone.

There was a clear difference of opinion on the Italian side as to the best way of meeting the forthcoming attack. Cadorna was convinced that he had to stand on the defensive, the more so as he was uncertain in which sector of the Julian front the chief blow would fall, but his instructions naturally included and recommended vigorous local counter-attacks. Capello, who commanded the II. Army, did not like the idea of the defensive. His army was in the main aligned for attack. Preparations had been made for a continuation of the offensive which had been broken off in Sept., and it was not possible, given the difficulty of communications and the risk of imminent attack, to take up those positions best adapted for defence. He felt, in addition, that opposite the Tolmino bridgehead he had little room for defence, and he was anxious to take advantage of the enemy's move by an attack N.E. from his positions on the Bainsizza plateau. In this idea he had the support of more than one of his corps commanders, but Cadorna thought, and it is difficult to meet his reasoning, that he could not throw in the forces necessary for such an attack when he was uncertain as to the direction of the forthcoming blow. His first news from the enemy side spoke of an attack against his new line on the Bainsizza. Later came the report of a more general attack, "from Plezzo to the sea." The enemy believed that Cadorna had been deceived by demonstrations made in the Trentino, and they had calculated, 

The main attack came in the direction anticipated, between Monte Rombon and Monte San Gabriele, and Capello had some 2,200 guns and nearly 800 trench mortars.

North of Tolmino the line on the left bank of the Isonzo was held by Cavaciocchi's IV. Corps, whose left wing held the Plezzo basin and was in contact with the Carnia Force on Monte Rombon. Next came Badoglio's XXVII. Corps, whose left wing, the 19th Div., raised to the strength of an army corps, held the lines opposite Tolmino. The other three divisions which completed the XXVII. Corps were across the river S. of the Isonzo. The 49th and 19th Divs., on the mountains W. of the Isonzo, lay the VII. Corps, newly reconstituted with units from other corps, and commanded by Gen. Buongiovanni. On the right of the XXVII., holding the line as far as the Sella di Dol between Monte Santo and Monte San Gabriele, were Caviglia's XXIV. Corps and Albricci's II. Corps, each of three divisions, with the XIV. Corps in immediate reserve. The Gorizia sector, from Monte Santo to the Vippacco, was occupied by the VI. Corps (Gatti) and the VIII. (Graziani). South of the Vippacco the Duke of Aosta's III. Army had three corps (seven divisions) in line—XI., XIII., and XXIII. The weak point of the Italian line was the Tolmino sector, the weakest part of this sector was at the junction of the XXVII. Corps (19th Div.) with the IV. (46th Div.), and the weakest position of all was that held by the right of the 46th Div., who were clinging to the slopes of Mrzli Vrh, completely dominated by the enemy, and badly off for communications with their neighbours. The Tolmino sector was chosen for the main enemy attack, and here, owing to a complex of circumstances, the Austro-German forces won a success that led to a great Italian disaster. In anticipation of the main drive in this direction, the II. Army reserves (XXVIII. Corps and various other units) were lying N. of Cormons, while three divisions under the direct control of Cadorna waited between Cormons and Cividale, at the foot of the valleys that run down S.W. from the threatened point. A further general reserve consisting of the XXV. (four divisions) and XXX. Corps (two divisions) lay about Palmanova, ready to be sent N. or E., according as the fighting developed.

The Italian preparations were much handicapped by the illness of Capello. From the beginning of Oct. the commander of the II. Army was seriously unwell, and though he had the assistance of Gen. Montuori, who was brought to Army Headquarters from the II. Corps, the II. Army undoubtedly suffered from the general dispositions calculated by Capello. On Oct. 22 Capello left for Padua, in the hope of securing a short rest, leaving Montuori in command. His rest lasted less than two days; for when the imminence of the enemy attack was confirmed by two deserting enemy officers, of Rumanian nationality, he returned to resume his command, reaching Cormons late on the night of Oct. 22.

The main attack came in the direction anticipated, between Monte Rombon and Monte San Gabriele, and Capello had some 2,200 guns and nearly 800 trench mortars. The army, which was known as the XIV. Army, consisted of nine Austrian divisions and seven German, divided into four "groups." The northern group of four divisions (three Austrian and one German Jäger) was commanded by Krauss, who had been called back from the Bukovina. Next came a group of three divisions (one Austrian and two German) under the German von Stein, and a group of two German divisions under the German von Berrer. South of these two central groups was a mixed group under the Austrian von Scotti (commander of the Austrian XV. Corps). This group consisted of one German and two Austrian divisions. Below these, E. of Tolmino, lay four divisions in reserve, atBelow's immediate disposal. Boročić had 20 divisions in his two "Isonzo" Armies between Azzua and the sea. Below and Henriquez (II. Isonzo Army) had some 2,500 guns and 500 trench mortars.
The bombardment began at two o'clock on the morning of Oct. 24, in wild autumn weather. There was a drizzle of snow on the high ridges, rain below, and mist everywhere. The bombardment opened with a shower of gas shells, mainly directed against the artillery positions. It was only later that a very heavy fire was opened on the movement lines of the Italian columns, and particularly on the zone to the rear of them. Towards dawn the fire died down, and it was thought on some parts of the defending front that the bad weather had counselled a delay in the attack. The wind had risen, the rain was blown in sheets, and the snow was whirling thickly on the mountains. But the attackers were to make skilful use of the weather conditions. Only on Monte Rombon, on Krauss's extreme right, an attack in conjunction with the left wing of Krobatin's X. Army had to be given up owing to the snow.

Krauss's main attack was a straight drive through the Italian lines in the Plezzo basin, his first objective the Saga deile. But he calculated that this position, too, must be carried in the first rush, so that he could reach without delay the great ridge of the Stol (6,407 ft.), which stood athwart a further direct advance. For this attack he detailed the 22nd Schützen Div., followed immediately by a Kaiserjäger and a Kaiser-schützen batt., which were to go straight for the Stol, and by six battalions of the 3rd (Edelweiss) Div., which were to make for the Val Fella by way of the Val d'Ucona. Krauss's left-hand division, the 53th (Bosnian), attacked the Vršič-Vrata ridge, with the object of breaking through to the Isonzo and Caporetto.

Krauss's main drive, after hard fighting, broke through the three lines held by the 50th Italian Div. in the Plezzo basin, but the attacking troops were checked at the Saga defile, where the Isonzo turns at right angles round the end of the Polonik ridge. When evening fell the position was still in the hands of the Italians, but the battle had gone badly for the defenders further south, and a retreat to the Stol became necessary. Krauss's Bosnians had met with no success against the left wing of the Italian 43rd Div., being driven back by counter-attacks after capturing the front lines, but Stein's group had carried all before it. Stein opened his attack with his right wing, the Austrian 50th Div., at 7.30 A.M., attacking the Italian 46th between Monte Nero and Vodil Vrh. A little later the Bavarian Alpenkorps, advancing from Tolmino, attacked the ridges below the Passo di Zagradan, while Berrer and Scotti attacked farther south. When both Stein's initial attacks were under way, the 12th Silesian Div., under the command of Gen. von Loquis, was sent in between them. Lequis attacked in two columns, one on each side of the river, with instructions to drive straight for Caporetto, where, it was hoped, he would join with Krauss's Bosnians. Both columns were completely successful. The right-hand column, which was strongly opposed by the Austrians and Div., pierced the extreme right of the Italian 46th on the E. bank of the river and pushed N.W. with all speed. On the opposite bank the attack was equally successful. The Alpenkorps were making good headway on the slopes above the road, where the Taro bridge, surprised in the mist, made a feeble resistance, and Lequis's left-hand column quickly reached the Italian second line, where the valley narrows below the hamlet of Foni. This line, running up to Monte Pleza, had been held, until the eve of the battle, by a Bersaglieri brigade which formed the extreme right wing of the IV. Corps, but at the last moment this sector was transferred to the command of the XXVII. Corps. The Bersaglieri were given to Cavaciocchi as an additional reserve, and Badoglio received the Napoli brigade for the purpose of holding this important point. Only one battalion, however, was placed on Monte Pleza; the rest of this regiment (the 67th) lay at Passo di Zagradan, high upon the ridge to the west, and the other regiment of the brigade (the 75th), together with the brigade command, was nearly three m. away, on the western slopes below Zagradan. The single battalion, of which only a platoon was down by the river, seems to have been taken completely by surprise, and run over and away, so that the Silesians proceeded on their way up the valley practically unnoticed. The rest of the regiment had seen and heard nothing in the mist (they were being heavily shelled), and the VII. Corps, of which the 3rd Div. was waiting on the Koločrat ridge, appears to have been equally unconscious of the course of the battle.

Meanwhile the Alpenkorps, Berrer's two divisions, and Scotti's right wing were breaking up Badoglio's left, while the left flank of the 43rd Div. and Cavagni's XXIV. Corps were being strongly attacked by Scotti's left and the right wing of Henriquez's II. Isonzo Army. The attack from Tolmino was carried out with skill, speed and resolution, and by a capital error which has never been satisfactorily explained the Italian guns remained silent until too late. Definite orders had been given both by Cadorna and by Capello that immediately upon the opening of the enemy's bombardment the Italian artillery should reply with a fire of "counter-preparation" upon the enemy's trenches and zones of concentration, and that they should lay down a barrage as there were signs of movement. This order was not carried out as intended, the guns of the IV. and XXVII. Corps, and particularly those backing the 19th Div., were apparently ordered to hold their fire till the word of command came from Corps headquarters. The word did not come to the batteries until too late, some never received it at all. The heavy mist, and the fact that the weight of the enemy bombardment had worked great destruction among the telephone wires, combined to prevent any effective reply on the part of the Italian guns. When the guns began, their fire was fitful, uncertain, blind, and they were too late. The enemy's attack had already developed, and the Italian guns opened on his trenches. Taken by surprise, puzzled by the comparative silence of their own guns and blinded by the mist, the troops of the 19th Div. opposed only a weak resistance to the Austro-German attack. They were heavily outnumbered, but they held strong positions which should have enabled them to delay the enemy advance until the reserves could come into play. Some of the troops fought with all their old stubbornness, but others gave themselves up or abandoned the trenches when the enemy columns came out of the mist.

Henriquez's attack on the Bainsizza plateau, although it met with some initial success, was readily repulsed by Badoglio's troops captured several hundred prisoners in a strong counter-attack. Badoglio hoped to hold the enemy attack from Tolmino, and turn the scale by a counter-attack on the Lom plateau with his three divisions on the left bank of the river. He seemed to have had the idea of doing on a smaller scale what Capello had wished to do in large, and it certainly appears as though he had kept his left unduly weak in the hope of being able to deal a heavy counter-blow. If he had obeyed in the letter Cadorna's order that the greater part of the forces belonging to the XXVII. Corps should be brought back to the right of their front, and concentrated at Isonzo and Vrh of the Austrians (on the right battalions more than the three divisions across the river), it can hardly be said that the spirit of the order was carried out. In any case, Badoglio was not afforded the chance of attempting any such manoeuvre as he may have had in mind. It was long before he received any news of how the day was going on the front of the 19th Div., and from the beginning of the action he was unable to communicate with his divisions on the left bank of the river. Telegraphs had broken down; the mist prevented signalling, and despatch riders do not seem to have been employed. It was not until the afternoon that Badoglio heard that his front lines were gone and his main positions threatened. He knew nothing of the break through in the valley and had no news from the IV. Corps. In a message sent to Army Headquarters at 4 P.M. he reported the enemy success south of Zela, but said that he had no news from the commands of the 19th Div. and the troops farther N., and that he was unable to communicate with anyone.

By 4 P.M. Lequis's Silesians were approaching Caporetto. The left-hand column was un molested by the troops of Buongiovanni's VII. Corps, which were lying too far back and moving too slowly in coming on the scene. The right-hand column, which had cut in behind the Italian 43rd Div., was making the task of the Austrian 50th comparatively easy, and brushing
side the spasmodic opposition of such small detachments as came in its way. The Austro-German advance was facilitated by the fact that Cavaciocchi had filled his front lines too full, and sent all his reserves across the river, in immediate support of the 43rd and 46th Divisions. When Lequis was approaching Caporetto Cavaciocchi had nothing in hand but a squadron of cavalry and one battalion of infantry which had not yet reached its destination E. of the river. For some hours previously Cavaciocchi had been calling on the VII. Corps, but Buongiovanni was very slow, not without excuse. His Corps was a scratch formation; his original left-hand division had been broken up two days before to strengthen the IV. and XXVII. Corps, and the 62nd, which had been assigned to him in relief, was only moving up to take its place in the 3rd, already aligned, but too far back, on the ridge running N.W. from the Passo di Zigradan. A further difficulty was that no definite plan of action had been agreed on between Cavaciocchi, Buongiovanni and Badoglio, whose close cooperation was clearly necessary. Or, if a plan had been made, it was one which had been completely upset by the rapid successes of the enemy. In fact, as has been shown already, Badoglio had little idea of how the fight was going on his front; Buongiovanni was in the dark regarding the general situation except for the calls which came from Cavaciocchi; and Cavaciocchi, who was in the greatest danger, had played his cards too soon, and had nothing left. Krauss records the satisfaction he felt when he observed that the additional troops given to the IV. Corps on the eve of the battle were sent forward instead of being held in reserve.

By the evening the situation was very favourable to the attacking forces. Stein was pouring troops through the breach made by the Silesians, and was making good headway with the 50th Austrian division on their right, while the Alpenkorps, Berrr and Scotti had broken through the lines opposite Tolmino, and in several places had gained the high ridge dominating the head of the Isonzo valley. Krauss was still held up at Saga and on Pontebba, and the Bosnians had gained no more ground. But the break-through between Tolmino and Caporetto had made these positions untenable.

At Cividale, where Capello had his headquarters, and at the Comando Supremo in Udine, the first news that came from the IV. Corps and the absence of news from the XXVII. made a grave impression. Capello sent up the army reserves by the valley roads, and dispatched Montuori to direct the "left wing" (the IV. and VII. Corps). This was a step which might with advantage have been taken earlier; indeed, the II. Army might well have been further divided and, if necessary, made up into an army group. It was too large, and covered too wide a front, for a single army command.

By evening the magnitude of the initial enemy success was clear, though it was not yet clear to what extent the whole Italian left wing was crumbling. There seemed good reason to hope that the advance might be blocked in the narrow valleys west of the Isonzo. But by nightfall both the IV. Corps and the 90th Div. were practically broken in pieces. Saga had to be abandoned owing to the break farther S., and the 50th Div., or what was left of it, retired into the Val d’Ucca and on to the ridge of the Stol, which was reached later by the remnants of the 90th, who had had their hands badly, but were in great part cut off when they attempted to come back across the Isonzo. A gallant detachment (Alpini and details of the Etna brigade), finding retreat impossible, held out for days on Monte Nero till the battle had gone far to the W., and all their food and ammunition were gone. The 46th Div. was practically destroyed, many having surrendered when they found the enemy at their backs, and others having joined the masses of supply service troops which were now filling the roads. The 62nd Div. (VII. Corps) was beginning to be attacked at Luico, while its left was extending to occupy Monte Matajur and join hands with the 53rd, which had been dispatched by Capello to block the Natisone valley. The 3rd Div. was still in its old position, but it was now being attacked in front and its right was uncovered by the defeat and practical destruction of the 19th.

The right wing of the 90th was still holding on Globocak and had been reinforced by the 1st Bersaglieri Brigade; Alpine troops still held a line down to the river, though they had been driven off their original positions on Krad Vrh, and troops of the 46th were being brought back from the left bank to strengthen this line. It was obvious that the positions on the Bainsizza could not be maintained. Capello had already transferred Badoglio’s division beyond the river to the command of the XXIV. Corps (Caviglia), and the order had been given to Caviglia and Albricci to withdraw their troops to their main lines of defence and to the former to prepare for a retreat across the Isonzo.

At this moment the most dangerous point appeared to be the extreme left wing, where the 50th Div. had lost touch with the Carnia force, and only the Potenza brigades, of three regiments, but much weakened by disease, was still in contact. Krauss had the Potenza brigade was wanted farther south. Two Alpine groups were already on the way to this critical point, having been dispatched the day before, but it was clear that Krauss would try to push through by this route, the shortest way to the Tagliamento. The occupation of Caporetto threatened to open another route nearly as short, but the possession of Monte Maggiore and the Stol, together with Monte Matajur, gave good hope that the advance of the enemy might be quickly brought to a halt when it had outrun the protecting fire of its own guns. Cadorna ordered the Carnia force to occupy Monte Maggiore and block the Val d’Ucca “at all costs,” and sent up a division to support the troops on the Stol. He gave orders for resistance to be made on three successive lines, but all of these radiated from Monte Maggiore, which was the key position. He gave orders for resistance on these lines, but at the same time he directed that plans and orders should be drawn up for a general retreat to the Tagliamento. This was a precaution only; at the moment, though the situation looked grave, there seemed little reason to doubt the capacity of the II. Army, and the reserves already under way, to stem the enemy’s offensive.

Next morning Cadorna warned the Duke of Aosta of the danger of the situation, and directed him to send his less mobile heavy artillery W. of the Piave and prepare for a retreat beyond the Tagliamento. Tassoni, who commanded the Carnia force, was also directed to prepare for a withdrawal of his troops.

The news on the morning of Oct. 25 was increasingly grave. Krauss was pressing upon the Stol, and finding a weak resistance; the Potenza brigade was falling back from Creda; Monte Matajur had fallen, practically undiscerned. Other positions were seriously threatened, and there was no confidence that they would be held. For it was now known in Cividale and Udine that the behaviour of some of the troops had been very unsatisfactory, that men of some units had been quick to surrender, while others had retreated before they were heavily attacked. And this unexpected lack of spirit was communicating itself to some of the reserves. These had a difficult task in getting to the scene of action, for as they marched up the narrow mountain roads they were met by ever-increasing masses of fugitives, the bulk of these belonging to the non-combatant services. The confusion and congestion on the roads may be estimated from the fact that in the area of the IV. Corps alone the number of non-combatant troops exceeded 30,000. Somehow the word went round, among combatants and non-combatants alike, that the war was over and that there was nothing to do but “go home.” Perhaps the cry was raised by enemy troops disguised in Italian uniforms, for some of these were found; more probably it was started by some who had drunk in the Socialist catchwords, pronounced by the deputy, Signor Treves: “This winter no one must be in the trenches”; who had believed the promise that if they laid down their arms the enemy would do likewise. It was an extraordinary case of collective deception, which hastened the break-up of Capello’s whole left wing.

A gallant resistance was still being made at various points, notably at Luico and Globocak, but the enemy had broken through at several positions of vital importance, and, as has been said, the reserves were becoming entangled in the crowds of fugitives, and some of them were becoming infected. On the
afternoon of Oct. 25 Capello, who could fight no more against an illness to which he ought perhaps to have given in sooner, and had been told by the chief medical officer of the army that he must resign his command, proposed to Cadorna an immediate retreat to the Tagliamento. His argument was that it was useless to send in more reserves to the chaos among the hills west of the Isonzo; that the only way to remedy the situation was to withdraw the bulk of the armies "from close contact with the enemy's rear guard, in the possession of a solid defence and eventual counter-attack. Cadorna agreed as to the probable necessity of retreat, but he was doubtful as to whether it should be immediate. He felt that unless he could delay the enemy advance down the Natissone and Judrio valleys by more than a mere rearguard action he ran the risk of having his centre and right, and all the mass of troops in the Udine plain, cut off from his bases. Montuori, who now succeeded Capello in command of the II. Army, was of opinion that he could hold on a line from Monte Maggiore to Monte Carnizza and thence across the valleys to Monte Korada. Cadorna decided to attempt the further stand, and, as the II. Army was obviously too large for movement, the left wing was given to Gen. Etna, late of the XXX. Corps, and the right to Gen. Ferrero, late of the XVI., while Gen. Sagamoso, who commanded the XIV. Corps, in reserve on the Isonzo, was charged with the duty of organizing a reserve line of defence on the river Torre. Tassoni, Di Robilant (IV. Army) and the Duke of Aosta were all warned to hold themselves in readiness for retreat, Di Robilant being told to send his big guns at once W. of the Piave to between Federobba and Mero., the VI. Corps was given to the Duke of Aosta, and given to the Duke of Aosta, who was already forming a reserve line on the western rim of the Carso, preparatory to the withdrawal of his main body. Gen. Di Giorgio was sent northward, with two divisions from the general reserve, to occupy both banks of the Tagliamento in the region of Pinzano. Cadorna hoped to hold, for a time at least, but at midnight on Oct. 26 he was wakened to hear the news that Monte Maggiore had fallen. He at once drew up the orders for a general retreat beyond the Tagliamento, and his plans were already matured for the longer retreat, across the Piave, which he foresaw would probably be necessary. Next day the weak resistance of the II. Army rearguards and the increasing number of disband soldiers confirmed his impressions. He saw, too, that there was, literally, no room to bring the II. Army back in good order. He was determined to keep the southern roads clear for the III. Army, and this meant that the retiring units of the II. Army would be so harassed by disband soldiers and fugitive civilians that most of them could scarcely hope to get back as units. In the circumstances h e had to count out the greater part of the II. Army and fall back on a line that could be held by a smaller number of troops. It was only to gain time that he attempted a stand on the Tagliamento. Provisional orders and plans for a retirement to the Piave were issued on Oct. 29. The mournful retreat began on Oct. 27, and the prospects were rendered still more serious by the fact that the Tagliamento came down in sudden and violent flood. The fords could not be used; several existing bridges were carried away, and attempts to throw new bridges were unsuccessful. The danger of losing more men and guns on the retreat became still greater.

Fortunately for Italy, and for the cause of the Entente, the German and Austrian were, in part at least, outwitting their transport. Krauss complains that only he and Krafft von Delsmensingen, Below's chief of staff, had been inspired by adequate ambitions for the attack. The objective had been Cividade, or, at best, the Tagliamento. Krafft thought they should have had the Adige in view. Krauss expressed the opinion that the real objective should have been Lyons. Without taking Krauss's aspirations too seriously, it may well be believed that if the German and Austrian Commands had worked out a bigger plan they would have done even more than they did do. But the transport difficulties were very great; Germany could not spare troops or material to make an unlimited effort on the Italian front, and the unexpectedly weak resistance of the Italian II. Army could barely have entered into the calculations of those who were bound not to take too many risks. Krauss himself admits that if the Italians had held the Stol in strength his own move would have been frustrated.

Krauss, Stein, Berrer and Scotti were very quick in their pursuit, and Berrer paid for his haste with his life. He was shot by an Italian carabiniere at the gates of Udine on Oct. 28, the day on which his advance guard entered the town, less than 20 hours after Cadorna and his staff left for Treviso. His place was taken by Hofacher. The Italian covering troops were delaying the enemy advance, and giving time for the III. Army, fighting a strong rearguard action, to come back across the Tagliamento. Henriquez had difficult mountainous country to cross before he reached the plain, and both he and Wurm were held up on the Isonzo, where the bridges had been destroyed by the retreating Italians. The critical days for the Italians were Oct. 30 and 31, when the pressure from the N. and E. threatened the flank and rear of the III. Army, whose task had been rendered more difficult by the fact that the permanent bridges at Casarsa had been blown up prematurely, owing to a false alarm. Many guns had to be left on the eastern bank, including 46 heavy batteries, which had been brought all the way from the Bainsizza. The Tagliamento was falling, however, and a number of troops succeeded in fording the river. It had been impossible to keep the Casarsa bridges for the III. Army, as several units of the II. and a large number of disbanded men had been forced down by the pressure from the north. But on the afternoon of Oct. 31, the German network of aads across the Isonzo was able to inform Cadorna that all of his rearguard, with the exception of four brigades, who were holding a defensive bridgehead covering Madrisio, had passed the Tagliamento. The bulk of this rearguard crossed the same evening, and only a small bridgehead was held at Latisana. A considerable number of II. Army troops, having failed to cross the river at Casarsa, were coming down towards Latisana pursued by Scotti's vanguard and threatened on the flank by Henriquez. Some of these succeeded in crossing at the Latisana bridges, but the enemy attacked in considerable force the following day, and a large number of Italians were cut off and taken prisoners. By the evening of Nov. 1, the left bank was entirely in the possession of the Austro-German armies.

Krauss tells a remarkable story according to which both Below, with Scotti's group, and later, Goigiinger, with the right wing of Henriquez's army, wished on reaching the Tagliamento to swing S., and cut off the Duke of Aosta's army, which, Krauss maintains, was still some distance to the east. According to Krauss, Boroevic refused to allow Scotti to encroach upon his line of march, and forbade Gen. Ludwig von Goigiinger to come S. of the line marked out for the II. Isonzo Army. But before Scotti was in a position to carry out the manoeuvre which Below is reported to have proposed, the bulk of the Duke's army was already across the Tagliamento, and his last four brigades were more than capable of dealing with anything Scotti could then bring against them. Before Goigiinger was on the spot the whole of the III. Army had passed the river and there were on the eastern bank only the broken troops who had come down from the N. in a last attempt to find a way across. Krauss's remark, that "Boroevic had saved the Italian III. Army," has no foundation. Boroevic knew more about the III. Army than the "German staff officers or Goigiinger, who did not even assume that the manoeuvre would have led to the capture of the King of Italy's band of Cadorna and his staff, a statement for which, though furnished by "a neutral crowned head," there are no grounds whatever.

Cadorna did not expect to stay long on the Tagliamento, but he did hope to hold up the enemy long enough to give adequate time for the retreat of the Carnia force and the IV. Army, and to organize a strong defensive line on the Piave. His weak point was the stretch of the river W. of Tarento, for which Krauss and Stein were making with all speed. Two divisions under Di Giorgio had been dispatched to hold this line, but
CAPORETTO, BATTLE OF

their march, at right angles to the line of the retreat and athwart the long streams of retiring troops and civilians, had been very difficult. Stein's troops, however, failed to cross the Tagliamento, their attempt being repelled with heavy loss. It was left to Krauss's Bosnians, after vain attempts to ford the river, to cross by the half-broken railway bridge at Cornino, on the evening of Nov. 2. The Bosnians had crossed by nine o'clock, surprising and driving back the small detachment watching the bridge. The following morning Di Giorgio was strongly attacked at Pinzano and Krauss established a sufficient bridgehead. On Nov. 4 Di Giorgio's left was pushed back still farther, endangering the line of retreat for the Carnia force divisions, and once more threatening the whole Italian line with envelopment from the north. For Stein was sending troops across to reinforce the Friuli sector, and the Austro-Hungarian commanders in the north, to claim the credit which was due to the Bosnians alone.

On the morning of Nov. 4 Cadorna ordered the retreat to the line of the Piave, and that night the troops holding the line of the Tagliamento resumed their march westward. Cadorna's main preoccupation was now for the IV. Army, which had been slow in getting under way, and for the Carnia force. Di Robilant wished to hold on in Cadore. It was natural, perhaps, that he should not have realized fully and at once the urgent necessities of the situation, but his hesitation to act promptly in accordance with Cadorna's instructions exposed him to the danger of having the retreat of his right wing cut off. For the safety of his route to the new positions assigned to his army depended now on the ability of the left wing of the worn-out II. Army to hold back the pressure of Stein's troops. Krauss's group had been sent N.W. through the mountains to the Upper Piave, to establish contact with Krubatin's X. Army and try once more to envelop the Italian left wing. This move cut off the greater part of Tassoni's Carnia force, caught between Krauss and Krubatin.

Di Giorgio's force and the rest of the covering troops of the II. Army slowed down the enemy advance, holding for some time on the Livena and the Monticano. The Austrian forces to which the VI. Corps had now been attached, was coming back steadily, though Boroević's advance guards were giving little peace to its covering troops. Cadorna had intended to put the battered units of the II. Army in reserve at once, to be reorganized and refitted; but the delay in the retreat of the IV. Army made it necessary to keep the II. and XXIV. Corps as part of the river defence force, the II. Corps in line from the Vidor bridge to Norvesa, the XXIV. in reserve, both under the command of Di Robilant, to whom was to be entrusted the sector from the Montello to the Brenta. The converging retreat of the IV. Army was being carried out under the command of Di Robilant. His troops succeeded in bringing away with them a great amount of material, but several detachments were cut off, including remnants of the Carnia force, which had been attached to the IV. Army for the latter part of the retreat.

By Nov. 8 the bulk of the IV. Army had succeeded in coming into line between the I. and the III., though part of the I. Corps was still on the road between Ponte delle Alpi and Feltria. On Nov. 9 and 10 the last covering troops of the II. and III. Armies crossed the Piave, from Pederoaba to the sea.

The line chosen to defend the frontiers of Italy implied a withdrawal of the right wing of the I. Army. This contingency had been studied, and preparations for a new line had begun, during the Austrian offensive in 1916, and Cadorna had ordered the work to be continued during the interval. Pecori-Giraldi retired from Asiago and Gallo, and based his right on the fortified lines of the Meleta group. This formed a salient, for the line marked out for the IV. Army E. of the Brenta ran considerably farther south. Di Robilant had taken over the XVIII. Corps from Pecori-Giraldi, and it had been gradually withdrawn from its old positions to hold a line that ran from near San Marino in the Brenta gorge nearly due E. towards the Piave, keeping always in touch with the IX. Corps as the latter came down from Cadore. The IV. Army now held the line from the Brenta to the Piave, and the short stretch of the river as far as the Montello. The rest of the river line was held by the Duke of Aosta, with the VIII. Corps on the Montello, the II., which had been in line between Pederoaba and the Montello, occupied in preparing defensive positions, going back to be rooted and re-fitted with the rest of the II. Army.

Reserves were coming in fast from the depots, including the young class of 1899. French and British divisions were already in Italy, and others were on the way. Many units of the II. Army were being rapidly reorganized and were soon to come into line again. But for the moment the Italians had only the I., III. and IV. Armies to hold the new line; and the III. and IV. Armies had been sorely tried by the retreat. There had been a serious breakdown in the morale of a part of the II. Army, which had been largely responsible for the extent of the enemy's initial success, and the tremendous strain of the retreat had not been helped by the fact that the ratio of desertions among the majority of the troops had been beyond all praise, but all were now worn-out, physically fatigued by the long trial of the retreat and suffering from the great moral depression caused by unexpected defeat and retirement from the lines they had held so long. Diaz, who took over the command from Cadorna on the morning of Nov. 9, had to face a situation that seemed almost desperate. The Italian armies had lost some 320,000 men in killed, wounded and missing, the number of prisoners being estimated at 265,000. The bulk of the II. Army had to be re-outset altogether, and the total number of troops to be reorganized and re-fitted was over 300,000. More than 3,000 guns had been lost, and over 1,700 trench mortars. There was shortage in equipment of every kind. It seemed scarcely possible that these greatly weakened forces could resist the renewed attacks of the victorious armies which had followed so closely upon their heels. Fortunately, the plans for defence had been well and truly laid by Cadorna in the limited time that was available, and, still more fortunately, his foresight had caused elaborate preparations to be made on Monte Grappa. Roads had been built and gun positions prepared, and reservoirs made for water; trenches had been dug; pallisades were constructed at various important points, though the defensive system was not completely finished when the enemy attacked at Caporetto. These works had been ordered with the double object of strengthening the defences of the Val Brenta against an attack from the N., and of providing against the possibility of a retreat to the Piave, which Cadorna had been compelled to consider once before, in May 1916. It was due to this foresight that resistance on the line now chosen was possible.

Diaz had little breathing-space, though some days were required before the enemy could prepare for an advance on the line of the Brenta. The difficulties of the terrain at Conrad saw a chance, and, though he was short of troops, he struck at once, while calling for reinforcements to be sent to him for the eastern armies. He attacked Pecori's troops on Nov. 10, as they were preparing to come back to the line already indicated. When they had taken up their positions in the Meleta-Badeneccie salient, Conrad's attacks were renewed, and for 10 days the fight continued, but brought no success to the Austrians, who lost heavily. Conrad had brought to this sector of the front all the troops who had been in the Fassa Alps, but he still felt himself too weak for the end he had in view; trenches had been dug to the plate, and he continued the despatch of further reinforcements. Meanwhile Boroević had tested the river defences at various points. On Nov. 12 a crossing was effected at Zenson, some 17 m. from the mouth of the river, and a small bridgehead was established in the loop formed by the curving stream. Various other attacks at San Dona, Intestadura, and the Grave di Papadopoli were unsuccessful, and the troops at Zenson could make no headway. Down by the mouth of the river Hungarian troops succeeded in establishing themselves between the Old Piave and the main stream, but they were unable to gain any more ground. As the days went on, other attempts to cross the river were defeated by the III. Army, and on Nov. 16 an attack in force failed completely. The Austrians crossed at various points N. of Ponte di Piave, but were repulsed with heavy casualties, losing some 1,500 killed and nearly as many prisoners. After this
failure Borović abandoned his attacks. The river was a serious obstacle; the Italian defence was sound; it was clear that prepared and careful preparation was necessary.

Conrad and Borović were making no headway, but a more dangerous attack was being conducted by Krauss, between the Brenta and the Piave. Krauss, who now had Krrobatin's troops under his orders, and subsequently drew reinforcements from Stein's group, wished to organize a double drive through the Brenta and Piave, and reach Venice by the tactics he had successfully employed in the Plezzo basin. Attempts to break through by the valley roads were quickly frustrated. Krauss blamed his divisional commanders, who, he says, were opposed to these tactics, and could not make up their minds to a resolute attack. An effort was finally made in the Quero gorge on Nov. 17 and failed badly. Nor were the numerous gallant attempts to capture the all-important ridge of Monte Tomba—Montfenera, which ran down from the Grappa massif to the Piave, more successful in breaking through the thin Italian lines. The struggle at this point lasted for five days, from Nov. 18 to 22, and the Italian IX. Corps, under Ruggeri Laderchi, fought a great fight. The critical day was Nov. 22. In the morning Krauss's troops, the Bosnians and the German Jäger, who had both been heavily punished already, made a great effort to break through. The attacking columns reached the crest of Monte Tomba, but their bolt was shot; and Montfenera still held firm and raked their left flank. The Italian position, however, was critical in the extreme, for the line had become very thin, and there were no reserves to speak of. At dusk a message came from Di Robilant that he was sending up a brigade of the VI. Corps, which had been drawn from the reserve of the III. Army. A later message promised another brigade. Ruggeri Laderchi took his courage in both hands, and, without waiting, counter-attacked with his own battle-worn troops. He drove the enemy off the ridge, except at one point where a gallant handful of men still clung to a knob of hill that had been made into a machine-gun redoubt. Next day the reserves arrived, and the line was firmly established. Only one more attack was made in this sector and both Jäger and Bosnian divisions had to be withdrawn and re-made.

When he failed in his first attempt to go through in the valley, Krauss resigned himself to a frontal attack upon the mountain lines between the Brenta and the Piave. He claims justly that the conditions were very difficult, but he made a big effort. The attack with his centre and right began on Nov. 21, while he was still hammering against Monte Tomba with his left, and he gained ground to begin with, driving back the Italian outpost lines in the Grappa sector. For a week the attack lasted, but little progress was made. The 22nd Schützen and Edelweiss Divs. who had broken through at Plezzo, and the 94th, from Krrobatin's army, gained a little ground on the right, the Alpine troops of the 22nd capturing the summit of Monte Pertica, but the German Alpenkorps and the Austrian 39th, which had passed to Krauss from Stein's group, to replace the battered Bosnian and Jäger divisions, made no headway against the salient of Solarolo and Spinoncia, or against the Tomba-Montfenera line. They succeeded in taking various positions, among them Spinoncia, but they could not hold them against the Italian counter-attacks, and further attempts to extend the success gained on the right were equally unsuccessful. On Nov. 26 the Edelweiss made a great attempt to capture Col della Berretta, but were repulsed, and a pause followed.

The breathing-space was needed by Di Robilant's troops, for the VI. Corps, under the command of Di Giorgio; and the Corps distinguished itself greatly in the fighting which followed. But a new attack was preparing, when the situation was eased by the arrival in line of the XXVII. Corps, already re-made, under the command of Di Giorgio; and the Corps distinguished itself greatly in the fighting which followed. But a new attack was preparing, when the situation was eased by the arrival in line of the British and French divisions which had hitherto been waiting in reserve. On Dec. 2 three British divisions under Lord Cavan took over the Montello sector, and a similar French force under Gen. Duchesne relieved Ruggeri Laderchi's IX. Corps in the Monte Tomba region. It was expected that both these points would be the object of early attack, but as it turned out they were both left un molested. Conrad and Krauss continued their attempts to break through on the mountains, but Krauss confined his efforts to the positions west of Monte Grappa and the worrying Solarolo salient. Borović remained quiet on the Piave front, and the rest of Below's army was now practically a reservoir for Krauss. But he also drew divisions both from Scotti and from Hofacher, as well as from Stein. Krauss was finding the question of communications very difficult, especially for his artillery ammunition, and could not open his new attack till Dec. 10. On Dec. 3 Conrad, reinforced by fresh troops but still complaining that he was starved for means of attack, opened a heavy bombardment on the curve of the Italian front from Monte Sisemol to E. of Monte Badeneche. Next day, by a skilfully conducted attack following a liberal use of gas shells, he pinned up the Meletta-Badeneche salient, occupying both Tondarecar and Badeneche and taking Monte Fior and Castelgomberto in the rear. Next day Conrad's eastern columns pushed down quickly towards Fovea, both kept by a rearguard of Bersaglieri and Alpini who fought off the attack until a new line was established farther S., covering Valstagna and the mouth of the Frenzela valley. But more than 11,000 prisoners were taken as a result of the gas bombardment and the breaking of the line at the base of the salient. It should be said that on this occasion as at Caporetto the Italian gas mask proved very unsatisfactory. The army was shortly afterwards equipped with the British mask.

The loss of the Meletta-Badeneche positions left another salient exposed to Austrian attack. The Hills S. of the Valle dei Bonchi were now open to artillery fire and infantry attack on three sides, and, after a fortnight's preparation, on Dec. 23 Conrad launched a new attack on the Italian lines between Monte Sisemol and the Frenzela valley. The salient was quickly wiped out, several thousand prisoners were taken, and both Col del Rosso and Monte Melago were captured. Next day the Italians counter-attacked, and re-took Col del Rosso and Monte Melago. They established themselves firmly in their reserve lines, and repulsed another attack, the last, on Christmas Day.

Between Conrad's two efforts Krauss had made a determined attempt to drive the Italians off the Grappa line. His command was now increased to the strength of 10 divisions, six Austro-Hungarian and four German, and he did not spare his troops. He opened his attack on Dec. 11 by a push on each wing of his front, from the Brenta valley and Monte Pertica against Col della Berretta, and against both sides of the Solarolo salient. The attack from the N.E. was carried out by German troops, while W. of Solarolo and Col dell' Orso were picked Austro-Hungarian divisions. After the first day, when the Brandenburgers of the 9th Div. took Monte Spinoncia, the N.E. outwork of the salient, the Germans could make no more headway, in spite of repeated attacks, in which they were supported by the 94th Austrian Div. on the other side of the salient. Besides the 9th, the 20th and the Jäger also took part in the attack, which was renewed again and again during 10 days, but no further progress was made. Krauss, who reports that he was not allowed to have the German troops on the spot more than 45 hours before they were to attack, claims that this "excessive sparing" of the troops worked out badly, for they suffered from insufficient acquaintance with the terrain. However that may be, the German divisions, in spite of a great expenditure of shells, could gain no ground. Sometimes a position was gained for a few minutes only, to be lost again. The fighting in the front was very stubborn for Krauss had better success with his right wing. At the end of four days' hard fighting the Austrian 4th Div. had taken Col della Berretta and Col Capriile, though their occupation was not firmly established, and the Italians were continually counter-attacking. Four days more, and Krauss's men had captured Monte Asolone, which looks down the Valle di Santa Felicità to the longed-for haven of the plain. This was the term of the Austrian advance. On Dec. 26 the Italians counter-attacked, and won back a good deal of the lost ground, the last move in the
long struggle. Krauss accepted failure for the moment, hoping for an early spring offensive farther west. Five days later the snow came, the heavy winter fall that was at least a month late. The Austrians and Germans were much favoured by the coming of winter, which greatly prolonged the strain on the hard-tried armies of Italy. But it gave also to the defending troops the chance to re-make at once a shaken reputation.

The recovery of the Italian army on Monte Grappa and the Piave, after the initial failures and the heart-breaking experiences of the long retreat, was a remarkable feat of courage and will. It will be clear from the narrative here given that the Caporetto disaster was not due solely to the cause which was at first generally accepted as the explanation of a defeat so sudden and so overwhelming. Cadorna's communiqué of Oct. 28, which contained what will remain a subject of contention, although it was simply an explanation, and was, moreover, unwise. Inevitably, the impression was left that the failure in moral sense was due more widespread than was actually the case. For in the whole course of the war no such candid announcement had ever been made by any commander on either side; it was assumed, especially abroad, that if Cadorna confessed this much there was far more that he did not tell. Cadorna wished to arouse both army and country to a sense of the situation, and to indicate clearly the results of the peace propaganda against which he had protested. In Italy the result was good, but the whole picture for the country was still a very great effort. But Cadorna's open condemnation of his soldiers was strongly resented in many quarters.

There is no question about the weak resistance of certain units in line, nor can it be denied that other troops, among the reserves, became temporarily infected with a spirit that led to what many observers likened to a strike. Extreme war-weariness and socialist propaganda had their offspring in these failures. But the failures were sporadic only. The stories current at the time and long after, of a preconcerted agreement for surrender to the enemy, have no foundation whatever. The defending troops were subjected to a very severe trial and some of them failed. Their failure led to disaster. How far might disaster have been lessened or averted if the preparations for the Austro-German attack, and the actual conduct of the defence, had been different?

The narrative has drawn attention to certain errors and misunderstandings which contributed to the enemy success. First among these, in order of time, was the difference of opinion between Cadorna and Capello as to the right course to pursue in face of the coming attack. It is difficult to avoid the impression that Capello was only half-hearted in adopting, and in directing his corps commanders to adopt, the line of action indicated by his chief. Whether Cadorna or Capello was right in idea is a question which will remain a subject of contention. Whatever Cadorna's arguments seem almost unanswerable. The point is that Capello would seem to have interpreted Cadorna's instructions as to counter-offensive action in too liberal a fashion, influenced, perhaps unconsciously, by his own wish to attempt a big counter-stroke. The fact remains that the bulk of the II. Army was still aligned for an offensive, and though a complete modification was impossible, certain changes might have been made. The situation of the IV. Corps was especially unfavourable for defence, the front-line positions of the 46th Div. being practically untenable. The Slem–Mzrl line position ought to have been abandoned for the Pleca-Sellice line, which was as strong naturally as the other was weak. Despite the weakness of the Slem–Mzrl line, both dominated and enfiladed, despite the practical certainty that it could not be maintained against a resolute offensive in force, the enemy attack found a large number of Italian guns, including many of medium calibre, stationed well in advance of the Pleca-Sellice line. Although various commanders had reported the Slem–Mzrl line indefensible, steps which should have followed logically had not been taken.

It is obvious also—after the event—that if the reserves for the IV. Corps had been close at hand, on the Stol and higher up the Natisone valley, the inrush of the enemy might have been stemmed. Such dispositions were clearly desirable, even before the event. There was, in fact, a tendency to underestimate the amount of time necessary for the transference of troops from one position to another. On the other hand, Cavaicocchi did not make the best use of the reserves which he had. Cadorna's efforts had not succeeded in making all of his subordinates grasp the principles of defence in depth, or of "elastic" defence. It was only later that the theories upon which he had for long insisted were understood and applied. And it may be admitted that the tendency to push the infantry too far forward was a necessary consequence of the policy which had left the guns aligned as for an offensive. The failure to hold in strength the roads on both sides of the Isonzo has never been satisfactorily explained. All that can be said is that an attack along these roads was apparently unexpected, that it came; and that it had its confusion and mix-ups. It is clear that there was insufficient collaboration between the three corps occupying the front attacked. This was doubtless due to the extreme pressure of the days which preceded the offensive, and to the many modifications which had to be made during these days. But it remains a grave omission.

The failure of the Italian artillery to carry out the general order of counter-preparation expressly given by Cadorna, and repeated in no less categorical terms by Capello, had an undoubted effect upon the course of the battle. The attacking troops, both gunners and infantry, found their task unexpectedly easy on account of the absence of a heavy return fire upon their batteries, trenches, etc. The Italian infantry, waiting under a crushing bombardment, were puzzled and disheartened by the silence of their own guns. This holding of the Italian fire, like the failure to appreciate the necessity for defence in depth, is explained by the fact that as regards the practice of defensive tactics the Italians were some two years in arrears. Cadorna and a few others had realized the progress made in attack methods and the necessity of meeting them with new methods of defence. The realization had not spread downward. The Italian armies on the Julian front had been so busily occupied in attack that they had not worked out the application of new defensive methods. They had had no recent experience in meeting an attack on the grand scale. It was this lack of practice, no doubt, and a false confidence based on obsolete experience, which led to the belief that even if the opening phases of the battle were unfavourable to the defence, there would be ample time to restore the situation. This spirit was widely evident in the disposition of troops and guns.

When retreat became inevitable, the prospects might well have seemed desperate to those who had to organize it. For the army, long used to the war of positions that had been the rule for 18 months, was in no condition to move. The retreat, with all its to do with the disaster that threatened, remains an astonishing achievement. The resistance which followed it, when the retiring armies turned and stood at bay on the mountains and on the Piave, was the greatest of Italian victories. (W. K. McC.)

Capps, Edward (1866-1921), American classical scholar, was born at Jacksonville, Ill., Dec. 21, 1866. He was educated at Illinois College (A.B. 1887) and Yale (Ph.D. 1891). In 1890 he was appointed tutor at Yale. In 1892 he joined the faculty of the newly-founded university of Chicago as professor of Greek language and literature, remaining there until 1907. In 1903 he was special lecturer at Harvard, and during the next two years studied at Athens and Halicarnassus. During 1906-7 he was managing editor of Classical Philology, in 1907 was elected president of the Classical Association of the Middle West and South, and the same year was called to Princeton as professor of classics. In 1914 he was elected president of the American Philological Association, and in 1917 was Turnbull lecturer on poetry at Johns Hopkins. In 1918 he was appointed head of the American Red Cross commission to Greece with the rank of colonel. In 1920 he was appointed minister to Greece, resigning in March 1921 and returning to Princeton. A leading authority on the Greek theatre, he contributed much to philological journals.

His works include The Stage in the Greek Theatre (1891); From Homer to Theocritus (1901); The Introduction of Comedy into the
CARINTHIA—CARNOCK

City Dionysia: a Chronological Study in Greek Literary History (1903) and Four Plays of Menander (1910). He was editor-in-chief of the University of Chicago Decennial Publications, 29 volumes.

CARINTHIA (see 5,336), a territory of the Austrian Republic, is bounded N. by Styria and Salzburg, E. by Yugoslavia and Styria, S. by Italy and Yugoslavia and W. by Tirol.

Area and Population. — The total area of Carinthia before the World War (1910) was 2,063 sq. m. (2,093 sq. m. after 1920). The term of peace deprived Carinthia of Kantal-Thal together with Tarvis and the lead-mines of Raibl, which were given to Italy; the district of Selcand, S. of the Karawanken, abandoned by Austria to Italy; the zones with the lead-mines in Schwarzenbach and the district surrounding the mouth of the Lavant, which was given to the Southern Slavs. The district of Triabach was divided between 7,700 inhabitants of whom 5,700 were Germans. The districts given to the Southern Slav state then had 17,500 inhabitants, of whom 3,200 were Germans.

It was arranged that the basin of Klagenfurt should decide its future allegiance by plebisicte. This plebisicte was taken in two distinct zones, the outer (Zone I, or A), of which the total votes; Zone II, therefore, won Austrian also.

In the Carinthia of to-day (apart from the two above-mentioned zones) 95.4% were German in 1910. Most of the Slovene population is west of the Karawanken, whereas Carinthia was entirely within the time of the Austrian census of 1920, the total number of the inhabitants of the Carinthia of to-day is uncertain. The portion under Austrian rule in 1920 (inclusive, therefore, of Zone II.) had 292,500 inhabitants, of whom 276,700 were German, or 93.5% of the total population and 92.9% of the total votes; Zone II, therefore, won Austrian also.

of Admiral Sir Frederick William Erskine Hamilton Nicolson, 10th Bart. (1815-90). He was educated at Rugby and Brasenose College, Oxford, and in 1870 entered the Foreign Office, where he was for some time assistant private secretary to Lord Granville. In 1874 he was attached to the British Embassy in Berlin, and after occupying a succession of minor diplomatic posts became in 1885 chargé d'affaires at Tehran. From 1888 to 1893 he was consul-general at Budapest, in 1894 secretary of embassy at Constantinople, from 1894 to 1895 agent in Bulgaria, and from 1895 to 1904 minister in Morocco. In 1899 he succeeded his father as 11th baronet. In 1905 Sir Arthur Nicolson was sent as ambassador to Russia, where he remained until 1910, and in the latter year returned to the Foreign Office, being until 1916, when he retired, permanent Under-secretary for Foreign Affairs. He received the K.C.I.E. in 1888, the K.C.B. in 1901, the G.C.V.O. in 1905, and the G.C.M.G. in 1906. He was raised to the peerage on his retirement, and took the title of Baron Carnock. He published in 1873 a History of the German Constitution.

CAROLUS-DURAN [CHARLES AUGUSTE EMILE DURAND] (1837-1917), French painter (see 5,361*), died in Paris Feb. 18 1917.

CARPATHIANS, BATTLES OF THE, 1915.—In Jan. 1915 the E. flank of the continuous battle-front in the Carpathians lay around Baligréd. Farther to the E. as far as the Rumanian frontier, the Austro-Hungarian High Command had so far succeeded in preventing any Russian penetration into Hungary by means of measures improvised to meet the immediate perils such as the use of Landsturm and volunteers. All these means, however, no longer sufficed.

Although the concealment of the concentration, which had to be carried out by means of a railway system of low efficiency, needed the utmost care and precaution. General Brussilov, at all events, spoke of the "whole position" being in jeopardy, in an order issued after the Austro-German offensive opened on Jan. 23.

West of the Czeremcha road 4 infantry and 2 cavalry divisions of the III. Austrian Army were to pin to their ground 5 Russian infantry and 1 cavalry divisions. On the E. flank Gen. von Boroević had 11 infantry and 2 cavalry divisions against 9 Russian infantry and 4 cavalry divisions; Gen. von Linsingen 6 infantry and 2 cavalry divisions against one Russian infantry and 2 Cossack divisions, and Gen. von Pflanzer-Baltin 6 infantry and one cavalry divisions against 2 to 3 Russian infantry divisions Reichswehr and 2 Cossack divisions. The Russian effective strengths were certainly the greater, but the Central Powers hoped despite all difficulties to keep the attack going. They were unobserved; and the battle in the Carpathians actually dragged on for some three and a half months.

After the Austro-Germans had opened their operations with brilliant initial successes, the winter became, as it were, an ally of their adversaries, and so confined the scope of operations that the Russians succeeded in taking timely counter-measures. The temperature fell 13° F. below zero, and as the troops were operating almost entirely in the open, exposed to all the severity of the weather—and that without relief—sickness and frost-bite soon took a heavier toll even than battle casualties, and the divisions had too few men to fill their battle sectors, which in any case were very wide. In view of the extent of the area of attack, the divisions had, almost without exception, to attack in a single line. After the melting away of their offensive energy no reserves were left for the continuance of the advance; after every action the strength of the troops, tried as they were by adverse circumstances, grew weaker; by Jan. 27 the III. Army was no longer in a position to continue the offensive, and between Feb. 5 and 8 the Southern Army was in the same case. According to the unanimous conviction of both leaders and men the attack had literally "stuck fast in the snow," and thenceforward the battle became a defensive one. The Russians on the 26th had replied

*These figures indicate the volume and page number of the previous article.
by a counter-offensive W. of the Mezőlaborcz railway, and from the 28th onwards this spread eastwards.

The Southern Army managed to hold its hard-won gains; the III. Army E. of Wola-Michowa still contrived to defend Hungary in Galicia behind the Upper San and on the hills N. and W. of Cisna; but the pressure of hostile masses (some 100,000 strong) astir the Mezőlaborcz railway and in the Dukla valley forced it back towards the Hungarian plains to the line Wola-Michowa, Stropko, upper course of the Ondava.

The arrival on the 8th of the XVII. Corps from the IV. Army and the VIII. from the Serbian theatre brought some relief. The XVII. Corps came into line W. of the VII.; of the VIII., the one division (the 21st Landwchr) was sent to the X. Corps, the other (the 9th) to the XIX. and XVIII. Corps which were most in need of assistance. After the arrival of these fresh forces, Gen. von Boroević commenced on Feb. 10 an attempt to recover the lost ground at Mezőlaborcz. This did not prosper, as the Russians here and in the Dukla valley, strongly reinforced, poured ever-fresh masses into the attack. The position of the III. Army grew daily more serious.

Meanwhile Gen. von Pflanzer-Baltin's army group succeeded, in a series of continuous actions from Jan. 31 to Feb. 20, in bearing its standards victoriously through the Bukovina and S.E. Galicia as far as Stanislaw. Its Eastern group (three divisions) had liberated the Bukovina and then moved by way of Kolomea to the N.W. in order to join the Western group (three divisions) which had advanced along the Marmarossziget-Kolomea railway and north-westwards to Nadworna. The Russians, despite their violent counter-attacks, had by the 17th been defeated at Kolomea and their group, fighting stubbornly at Nadworna, was compelled by the increasing pressure on its flank to fall back towards Stanislaw on the 19th. This town was occupied on the 20th by the main body of Pflanzer-Baltin's command, which had been reinforced on the 17th by two cavalry divisions; meanwhile the left wing on the Lomnica wheeled in towards Dollna in order to open up for the Southern Army the issue from the mountains. Already, however, the concentration N. and W. of Stanislaw of powerful Russian forces—the leading troops of Lechitski's IX. Army—made it evident that the Russians were here preparing a counter-offensive. The well-developed railway system in Galicia facilitated the rapid reinforcement of the Russian eastern wing. With this the Austrian higher command was unable to compete successfully, for on the mountain railway by Marmarossziget only three divisions (5th from the I. Army, XI. Corps from the III. Army) could be brought up by the early days of March.

It was this circumstance, and the limited time during which the fortress of Przemysl could hold out, which had meanwhile determined the Austrian higher command, in spite of the experiences of winter in the Carpathians, to assemble behind the right wing of the III. Army the forces made available by the weakening of the Russian forces in Poland and the fortifying of positions there, although here none but a frontal attack was possible, and although to the Austrian higher command the offensive of the Pflanzer-Baltin army group seemed to promise the most decisive result. Since, however, a direct support of this group was impossible within the necessary time limit, the plan was to divert by a new attack over the Carpathians, such strong Russian forces as to enable the eastern wing to continue the offensive.

The Southern Army was reinforced by the German 4th Infantry Division. In order to build up the II. Army behind the right wing of the III., from Feb. 6 onward three divisions (27th Inf. Div. and IV. Corps—31st and 32d Inf. Divs.) were withdrawn from Poland and the 41st and half the 38th Honved Divisions from West Galicia. On Feb. 15 Gen. von Bohm-Ermolli took over the command of these forces, together with the eastern half of the III. Army (Sanzmay's group, consisting of the V., XVIII. and XIX. Corps) which numbered 60,000 rifles.

The left wing of the II. Army as now constituted was fighting with its last reserves of strength. The troops were exhausted almost to the point of collapse by continuous fighting and the severity of the weather. The Russian divisions, on the other hand, were in a better position in that they could usually allow two regiments to rest while two others attacked. It was only owing to the most strenuous exertions that the Austro-Hungarian troops succeeded, without reliefs, in holding the crests and preventing the successive waves of the Russian assault from sweeping away the thin line of defence. Again and again reserves drawn from the front itself came to the support of the points most in danger, a process which exhausted the strength of the
troops, who never had any rest, and led to a lamentable intermixture of the various units.

The commander of the II. Army, whose first care was the consolidation of his line by means of reserves, proposed to assemble his reinforcements secretly around Cisna, thence, in conjunction with the III. Army's right wing to strike in the direction of Wola-Michowa, and immediately afterwards to deliver with his concentrated forces a crushing blow northwards from both sides of Baligrod. The attack on Wola-Michowa was intended to recapture Lupków station, the junction of a narrow-gauge railway running behind the front of the II. Army.1 The recovery of this line would considerably facilitate the supply of that army, the bulk of which was dependent on a single practicable road, of which the condition had alarmingly deteriorated owing to the unusually early thaw. Meanwhile it was no longer possible to ignore the urgent need of support for the W. wing of the army. On Feb. 16 the 16,000 men of the XIX. Corps on this flank were faced by 28,000 Russians, and a division had to be brought into line on the 20th, and another on the 23rd.2 Not only was the opportunity of surprising the enemy lost, but they were allowed still further time to take counter-measures by the postponement of the Austrian attack on account of the condition of the roads.

The critical position of Przemyśl and the continuing concentration of the IX. Russian Army facing the Austrian E. flank induced the Austrian high command to press for an immediate offensive. The Russians had also detached troops from the IX. Army (II. Cav. Corps and 11th Div.) to strengthen Lechitski's army, and the transference thither of other forces from the Nida front (XVII. Corps, 3rd and 5th Divs.) was also probable. In view of the disposition of the railways the only possible method of assisting Pflanzer-Baltin's army group was for the II. Army to attract to its own sector, by means of an early attack, as many hostile troops as possible. This course would considerably increase the difficulties of the II. Army, the special task of which was the relief of Przemyśl; but its considerable numerical superiority over its enemies seemed to the Central Powers to afford a prospect of success. South of the Vistula there stood 301 Russian divisions (exclusive of those investing Przemyśl) as against 49 Austrian and German divisions; though many of the Austrian divisions had, it is true, been reduced to little more than the strength of infantry regiments. Every attempt was made to assemble superior forces in the decisive sector, from the Dukla pass to E. of Cisna. In the first few days of March, 17 divisions could be opposed to 7 or 8 Russian divisions, if the reinforcements sent to the II. Army were utilized on the W. wing. In addition, one division from the IV. and one from the I. Army3 were used here, bringing up the total of fresh divisions to six and a half. The remainder were in many cases dead tired. Under these conditions the offensive of the III. Army which was ordered at the same time could hardly be very effective, and the main burden of the fighting fell to the II. Army.

Misfortune pursued it, however, from the first. The peril of Przemyśl necessitated working to a time limit and in other ways exercised a powerful influence on decisions taken. The increasing difficulty in the matter of supplies led to the opening of the attack on Feb. 27, before the concentration was complete, and to the choice of the direction of Baligrod for the line of attack as being "the shortest road to Przemyśl"; while the action planned against Lupków was in the end abandoned owing to the loss of time involved. The Russians, entrenched in their strong snow fortresses, were able continually to bring up reinforcements strong enough to deny to the group under Gen. von Tersszyńský, advancing astride the Baligrod road, that decisive initial success which later experience in war has shown to be so important in attempts to break through the enemy's line.

Immediately after the opening of the offensive, the temperature sank once more to 15° F. below zero. The troops lost heavily from this cause and also from the methods of combat adopted; these latter were conditioned mainly by the necessity ofbringing speedy help to the garrison of Przemyśl, and the universal idea that this must be achieved at all costs led too often to massed infantry attacks against barred wire without sufficient artillery preparation. A week had elapsed and no ground had been gained beyond the initial advance of 10 m. in depth astride the Baligrod road. On March 5 the High Command therefore ordered a general attack along the whole Carpathian front. The S. wing of the IV. Army4 was to advance on the 6th by Gorlice in the direction Jaslo-Zmigrod. This had already been recognized by the Austrian higher command as the weakest spot in the Russian line, but even now it had not sufficient forces available to enable it to make full use of this knowledge. The attack was delayed till the 8th, and succeeded in pinning the Russian forces to their ground; parts of von Woyrsch's army detachment and the IX. German Army attacked N. of the Vistula with the same object between March 6 and 9.

During the next few days the III. and Southern Armies carried out no important operations. The II. Army attacked with all its forces along the whole of its front, between March 5 and 10. In spite of this the Russians, by the roth, had succeeded in bringing into action forces equal to those of their assailants; they were able—with the advantage of strong mountain positions—to oppose to the 112,000 rifles of the II. Army about the same number. On the decisive W. wing they had from 21,000 to 28,000 fresh rifles in reserve as against 13,000 fresh Austrian rifles.5 This was decisive, for the II. Army was by now completely exhausted. Its losses between March 1 and 15 amounted to 51,000 men (over a third of its total strength on March 1).6 Two-thirds of these casualties—855 officers and

5 Total strength on March 1, inclusive of divisions still en route. 148,850.
37,205 other ranks—had been suffered by Tersztyánsky’s group, only some 79,000 strong.

The offensive of the II. Army culminated on March 20. The Russian counter-offensive, commencing on the 11th with a flank attack by Wola-Michowa, checked the attack astride the Baligrod road, and on the 14th it had to be abandoned as hopeless.

The offensive wedge of the II. Army had acted as a magnet to some 51 Russian divisions. Among these were the 35th and 3rd Divs., so that the object of relieving the pressure on Pfanzer-Baltin’s front had been achieved.

General Lechitski had commenced his offensive against this group with four corps on Feb. 28, and the Austrian right wing, outnumbered, had fallen back, fighting stubbornly, to N. of Obertyn. Thanks to the timely arrival on March 4 of the XI. Corps from the IV. Army, Pfanzer-Baltin’s troops succeeded in holding their new front, although the Russians had by the 10th advanced in N. Bukovina as far as the Pruth. On March 18 their offensive against the Austrian E. wing came to a standstill.

The relief of Przemysl had thus proved impossible. However, in order to assist the garrison in its attempt to cut its way out, by holding fast as many Russian troops as possible, a striking force was assembled, despite all obstacles, on the E. wing of the II. Army. There could be however no question of cooperating with the garrison, as the sortie attempted on the 19th broke down while still within the fortress area, all stocks of food being exhausted; a capitulation was signed on the 22nd after all war material had been as far as possible destroyed.

The failure of the attempts to relieve Przemysl much discouraged the Austrian troops, particularly those of the II. Army. Their endurance and self-sacrifice, however, were not entirely in vain. The attention of the Grand Duke Nicholas had been so riveted on the danger threatening him to the S. of Przemysl that he lost sight of the duty of cooperating with the Western Allies of Russia, and decided to attempt a break-through into Hungary with the forces now assembled to the S. of Przemysl. This was quite in accordance with the wishes of the Austrian and German high commands, which, up to that time had sought to defend Germany by continuous attacks in the Carpathians. The strong Russian forces now directed against Hungary were being enticed into a region where in winter, as had recently been proved, full advantage could not be taken of superiority of numbers, a superiority easier in the circumstances to destroy than to maintain.

The last great attempt of the Russians to break through began on March 20 with an onslaught of unexampled violence against the whole front of the III. Army, which, despite all it could do, was gradually forced farther back in the direction of Hungary. Units of the IV. Army arriving on the 28th to reinforce the left wing brought the attackers to a stand; but against the centre and right of the army the Russians continued their attacks with ever-fresh forces, and it was obvious that their object was to break through towards Varanovo and Homonna, the most northerly points of the Hungarian plain. This caused the utmost anxiety to the II. Army command. As early as the 23rd a gap existed between the left flank of that army and the retreating right of the III. and, although, itself heavily pressed, the II. Army had no option but to put in some march battalions to fill it. Again on the 26th, at a time when its own front was weakening rapidly, the army dispatched a combined brigade from its W. wing, and one infantry and one cavalry brigade from its E. wing to the III. Army. (The infantry were sent back later.) Any further successes against the right of the III. Army must have seriously menaced the position of the II. Army stationed N. of the frontier ridge. On the 27th, accordingly, the army command proposed a voluntary withdrawal; but the high command, which throughout these days of dire peril still held firmly to its offensive projects, refused its assent, as the blocking of the Laborcz valley by the German Beskiden Corps (4th German Div. of the Southern Army, 25th Res. Div. of the IX. Army, 35th Res. Div. of Woyrsch’s group) had been begun.

Meantime, however, the Russians at the end of March had driven the II. Army to retreat. The system of constantly patching the front with troops withdrawn from other sectors was no longer possible, in view of the fact that the enemy’s attacks were now simultaneous all along the army line. The lack of good roads prevented these reserves arriving in time or in sufficient numbers to gain isolated successes. The Russians, being superior in numbers, were able to seize the opportunity afforded by the withdrawal of reserves from the centre of the II. Army at Cisna to drive in its front in that sector. Here they seriously menaced

the single practicable road, by which alone a deliberate withdrawal could be carried out by the Austrians. The situation being now critical, the II Army command on April 1 gave the order for a retreat. The sorely tried II Army had to fall back in one bound between April 2 and 4 to the line Patakafalu–Nagypolyany–N. of Vrava, to the S. of the Carpathian ridge; only Szmuray’s group, detached to the Southern Army, was to hold the Uzsko pass on the crest itself.

The effect of this surrender of the main ridge was not only to shorten the Austro-German front, but also to utilize the mountains, hitherto an impediment to their operations, as an obstacle against the Russians and improve the internal situation of the II Army (practicable roads and billeting facilities right up close behind the front). The Russians did not molest the withdrawal; indeed when it began they were endeavouring with the forces set free by the fall of Przemyśl to break through in the Laborcza valley; but when Szmuray’s group, detached to the Southern Army, was to hold the Uzsko pass on the crest itself.

The effect of this surrender of the main ridge was not only to shorten the Austro-German front, but also to utilize the mountains, hitherto an impediment to their operations, as an obstacle against the Russians and improve the internal situation of the II Army (practicable roads and billeting facilities right up close behind the front). The Russians did not molest the withdrawal; indeed when it began they were endeavouring with the forces set free by the fall of Przemyśl to break through in the Laborcza valley; but when Szmuray’s group, detached to the Southern Army, was to hold the Uzsko pass on the crest itself.

The positive objective twice attempted by the Central Powers, the relief of Przemyśl, was not achieved. Their negative aims were, however, successfully accomplished; the Russians were prevented from attacking Germany, and their attempted invasion of Hungary was also frustrated. Finally the gradual melting away of the best elements of the old Imperial Russian Army was one prominent cause of the great successes of the Central Powers during the spring offensive.

Carpenter, William Boyd (1847–1918), English divine, was born at Liverpool March 26 1841, the son of the Rev. Henry Carpenter, incumbent of St. Michael’s, Liverpool. He was educated at the Royal Institution school, Liverpool, and at St. Catherine's College, Cambridge, where he graduated in 1864, being ordained the same year. He earned a great reputation as an eloquent preacher, and in 1882 became a canon residentiary of Windsor, two years later being made bishop of Ripon. He resigned his see in 1911, and was made canon and later sub-dean of Westminster. He died in London Oct. 26 1918.

Carr, Joseph William Comyns (1849–1916), English art critic and dramatist, was born in London March 1 1849, his father being a member of an old Cumberland yeoman family. Educated at the university of London, he was called to the bar in 1869, but soon became a writer of art criticism for the Pall Mall Gazette and, after 1875, editor of L'Art. He also founded and edited the English Illustrated Magazine, and was associated with Charles Hallé in the founding of the New Gallery, an offshoot from the Grosvenor Gallery, in 1888. In his later years he engaged in theatrical enterprises, and he was the adapter, alone or in collaboration, of a good many plays, notably Hardy's Far from the Madding Crowd (1882) and the version of King Arthur produced by Sir Henry Irving at the Lyceum theatre in 1893. He published Some Eminent Victorians (1908) and Counting Bohemia (1914), both containing reminiscences of his own early life and the people he had known. He died in London Dec. 12 1916.

Carranza, Venustiano (1859–1920), Mexican revolutionary and president, was born Dec. 20 1859, at Cuatro Cienegas, Coahuila. He was educated in the Ateneo Fuentes at Saltillo and in the Escuela National Preparatoria at Mexico City. Protective eyesight prevented a legal career for which he had studied. Entering politics, he became presidente municipal of Cuatro Cienegas in 1887. In 1893 he and his brother Emilio led a revolt against the repeated candidacy of García Galán for the state governorship, and they succeeded in inducing President Diaz to name General Múzquiz as governor. Carranza was first elected senador suplente (alternate) for Coahuila for 1900–2. On the death of the proprietary Ortiz de Montellano, he took his seat April 5 1901. He was elected proprietary senator for 1904–8, and again for 1908–12, but served only until Dec. 15 1910. In the position of senator he was amenable to the control of Diaz. In 1909 he became candidate for the state governorship in opposition to the wishes of the central Government. In the following year he joined the Madero revolution, serving as a member of the Junta Revolucionaria at San Antonio, Texas. Madero made

him chief of the military division of Coahuila, Nuevo Léon, and Tamaulipas and later Minister of War in his provisional Cabinet. In this position he organized Madero's army. After the triumph of the revolution he returned to Coahuila and assumed the governorship, to which he was regularly elected in May 1911. After the coup of General Huerta, Feb. 18, 1913, and the murder of Madero, to whom he was attached, Carranza issued the Plan de Guadalupe in March, disobeying Huerta as president. He then became First Chief of the Constitutionalists army and personally visited all northern Mexico to organize the opposition, establishing his government at Hermosillo, Sonora, whence he moved southward until he entered Mexico City Aug. 20, 1914, after Huerta had fled. He was opposed by Francisco Villa and Emiliano Zapata after the split of the Constitutionalists, and withdrew to Vera Cruz, which he occupied when the American occupation terminated. On Oct. 9, 1915, he was recognized as head of the de facto Government by the United States and seven Pan-American powers. On Sept. 30, 1916 he declared the abolition of the vice-presidency and the limitation of the presidential term to four years instead of six. He was elected to the presidency March 11, 1917, under the constitution promulgated under his sanction on Feb. 5. Under this radical body of fundamental law he issued a series of decrees for the nationalization of petroleum lands, which kept his Government continually in strained relations with England, France and the United States. As the time approached in 1920 for the election of his successor, he attempted to force the election of Ignacio Bonillas, a civilian candidate. This led to an attempt to control the state government of Sonora, a stronghold of Alvaro Obregón, who was the strongest and most popular aspirant for the presidency, but who was inimical to Carranza's policies. The state revolted in March 1920, being immediately followed by the country at large. Carranza attempted to move his Government to Vera Cruz on May 7. His flight was interrupted and he himself was killed as he was fleeing the country, on the night of May 18, at Tlaxcala, Puebla.

CARREL, ALEXIS (1873– ), Franco-American surgeon, was born at Sainte-Foy-lès-Lyon, France, June 28, 1873. He graduated at the university of Lyons (L.B., 1890; Sc.B., 1891; M.D., 1900), and for two years was prosector à la faculté de médecine at that university. In 1900 he became a member of the Rockefeller Institute for Medical Research in New York. There he won world-wide fame by his experiments in transplanting human organs. In 1912 he read before the American Medical Association a paper on Preservation of Tissues and its Application to Surgery. The possibility of keeping alive tissues removed from the organism led to his seeking practical means of preserving them for surgical use. He was awarded a Nobel prize in 1912 for his contributions to surgical knowledge. On the outbreak of the World War he returned to France and devised the Carrel-Dakin treatment of wounds. Using H. D. Dakin's preparation, a neutral solution of hypochlorite of sodium, Carrel's apparatus keeps the wound continually moist. Countless amputations were avoided, healing was rapid, and scars supple. In 1919 he resumed his work at the Rockefeller Institute.

CARSON, EDWARD HENRY CARSON, BARON (1854– ), British statesman and lawyer, son of Edward Henry Carson, C.E., Dublin, was born Feb. 9, 1854 and educated at Portaferry school and afterwards at Trinity College, Dublin. He was called to the Irish bar, and made his reputation as Crown Prosecutor in Dublin in the difficult years when Mr. Balfour was Chief Secretary for Ireland. His pluck, readiness, wit, and skill in cross-examination soon brought him to the front both in legal and in political circles. He became a Q.C. at the Irish bar in 1889; but his ambitions could not be satisfied with legal eminence in Dublin. He was called to the English bar, and took silk there in 1894. Meanwhile he had been returned to Parliament in 1892 in the Unionist interest as member for his own university of Dublin and was for a few months Solicitor-General for Ireland. He entered Parliament just when Gladstone was about to make a second effort to pass a Home Rule bill, and he helped the Unionist leaders to defeat the measure. But during the next 20 years he was mainly occupied with his professional work. Having risen to a leading place at the bar in Ireland, he achieved an even more striking success at the English bar; and in 1900 he was appointed Solicitor-General, a post which he held until the change of government in 1905–6. In the early years of the new century he gradually came to be regarded as the spokesman in the House of Commons of the Irish Unionists, and in that capacity welcomed Mr. Birrell's University bill of 1908.

It was not until 1911, when another Home Rule bill was imminent, that Sir Edward Carson emerged as a political figure of first-class importance. He bitterly resisted the Parliament bill, which was to curtail the power of the Lords and enable a measure of Home Rule to be passed over their heads and without a direct appeal to the people. He was one of the "Die-hards" who urged the peers to take the responsibility of throwing out the bill in spite of the ministerial threat to swamp their House with sufficient new creations to make its passage secure. He told the House of Commons that the passing of Home Rule by force would be resisted by force and that the resisters would be constitutionally right. Feeling against the bill was most bitter in Ulster, which, Protestant and loyal, would be placed by it at the mercy of the Roman Catholic and largely disloyal majority of the other three provinces. He went to Ulster in the autumn, and at an enormous Unionist demonstration at Graigavon, near Belfast, endorsed the threats of rebellion against Home Rule which previous speakers made. Belfast, he said, was the key of the situation; Ulster would never submit to a Parliament in Dublin. They must be prepared, if necessary, to take over the administration of those districts which they were entitled to control. Practical measures were immediately undertaken in this direction, though Liberals and Nationalists scoffed. His position was that he and his Ulster friends were loyal to the constitution as it existed; they were only rebels, he said, in the sense that they desired to remain under the King and the imperial Parliament. In anticipation of the introduction of the Home Rule bill in the spring of 1912, he presided over a gigantic gathering in Belfast in Easter week, which Mr. Bonar Law, the newly appointed Unionist leader, came to address; and he made those present repeat after him, "We will never, in any circumstances, submit to Home Rule." He himself, in a speech instinct with passion, moved the rejection of the bill on its introduction, and took a leading part in opposition during its subsequent stages. But his activity was mainly outside. He made frequent speeches in the next couple of years in different parts of England and Scotland, particularly at a great demonstration at Blenheim in July 1912, at which Mr. Bonar Law pledged the support of the Unionist party to Ulster. But his principal work was in the organization of resistance in Ulster itself, including the formation of a local volunteer force, which speedily assumed large proportions. In Sept. 1912 he was the chief figure at a series of demonstrations in all parts of the province, culminating in an enormous assemblage at Belfast on Sept. 28. There he took the lead in signing a solemn covenant by which the men of Ulster bound themselves to stand by one another in defending their position of equal citizenship in the United Kingdom, and in using all necessary means to defeat the conspiracy to set up Home Rule, and further pledged themselves to refuse to recognize a Home Rule parliament. He followed this up by moving unsuccessfully in Parliament on New Year's day 1913, to exclude Ulster from the operation of the bill. In the autumn of 1913 the Ulster Unionist Council organized itself, under his supervision, into a provisional Government, of which he was the leading member, and a guarantee fund of £1,000,000 was initiated to which he himself contributed £10,000. He reviewed the volunteers, who were rapidly becoming a formidable military force approaching in number 100,000 men. But when ministers, who had refused to prosecute him or interfere with his activities, began to realize the determination of the six north-eastern Protestant counties, he did not repulse their overtures for a settlement by consent, but said that it must not establish a basis for separation. His advice during the following winter to his Ulster friends was "peace but preparation." He entirely declined to accept Mr. Asquith's offer, in the spring.
of 1914, of a county option of exclusion for six years. That was a "sentence of death with a stay of execution." If that was the Prime Minister's last word, his place was in Belfast; and he and several of his fellow Unionist members from north-east Ireland made a dramatic exit from the House on March 19 to go to Ulster. When he returned for the debates on the Curragh incident he told the House that there was only one policy possible, "Leave Ulster out until you have won her consent to come in." He became a member of the abortive Buckingham Palace Conference convened by the King in the hope of compromise; and when that broke down in the end of July it looked as if he and his Ulster friends would have to make good in action their policy of force.

The World War supervened, and switched off his activity into another direction. Though he resented, as a breach of the political code, the Attorney-General's determination to pass the Home Rule bill into law while suspending its operation and promising some form of special treatment for Ulster, he went to Belfast in order to stimulate Ulstermen and especially Ulster volunteers to join the British army, and had a considerable success. He was eager for a thorough prosecution of the war, and accordingly joined Mr. Asquith's Coalition Ministry of June 1915 as Attorney-General, resigning however in Oct., because he thought that the policy of the Cabinet, after the defection of Greece, involved the desertion of Serbia, a small country in whose fate he took a profound interest. He was strongly in favour of the Compulsory Service bill in 1916, and regretted that Mr. Redmond would insist on excluding Ireland from its provisions. He looked favourably upon Mr. Lloyd George's efforts that summer to arrange an agreed settlement of the Irish question, and when that statesman formed a new government in Dec. for the more efficient conduct of the war, joined his Cabinet as First Lord of the Admiralty. The great anxiety of the Board of Admiralty at this period was how to counter the German submarine attack which was steadily increasing in intensity. He placed his reliance mainly on an Anti-Submarine Department which had been established in Whitehall, consisting of the most experienced men serving at sea, and on the Board of Inventions, under Lord Fisher, with whom he was concerned some of the greatest men of science in the country. His shipbuilding programme was largely one for making good losses in the mercantile marine. The losses however continued to increase, and led to a reorganization of the Admiralty, with a view to strengthening the navy war staff as well as to put the supply on a sounder basis by revising the office of Admiralty Controller. Outside his departmental duties Sir E. Carson warmly promoted the Irish Convention which the Government assembled this year. In July he quitted the Admiralty to become a member of the War Cabinet without portfolio, a position which he resigned at the beginning of 1918. But, in his new office, his activity was directed wholeheartedly to the vigorous prosecution of hostilities.

After the war was over, Ulster and Ireland regained the first place in his thoughts. At the general election of 1918 he left Dublin University, in order to represent one of the divisions of Ulster's capital, Belfast. On the anniversary in July 1919 of the battle of the Boyne, he restated, speaking near Belfast, Ulster's position and claims, demanded the repeal of the Home Rule Act, threatened to call out the volunteers if any attempt were made to change Ulster's status, declared Dominion Home Rule to be merely a blind for an Irish Republic, and criticized Sir Horace Plunkett as one who was distracted by both sides. When, however, Mr. Lloyd George proposed in the winter his bill for the reform of the government of Ireland, establishing parliaments and executives both in Dublin and in Belfast, and a Federal Council for all Ireland, he moderated his attitude. Though he would have preferred that Ulster should remain in the United Kingdom, yet, as this bill gave her a parliament of her own, he would not oppose it. When the bill left the Commons in Nov. 1920, he said that, though Ulster did not ask for a parliament, she would do her best to make the arrangement a success. He exerted himself to that end in Ireland, with the result that the Unionists succeeded even beyond their hopes in the elections in May 1921 for the first Ulster Parliament, and so started with an overwhelming majority. But he declined to sit in the new parliament himself; and he also resisted the suggestions that he, as the most outstanding fighter in the Unionist party, should be put forward to succeed Mr. Bonar Law as leader in the British House of Commons. He had done his best to save Protestant Ulster from domination by the Roman Catholic majority of the south and west. He was 67 and had felt the strain of the last 10 years; so he quitted active politics, and accepted a lordship of Appeal and a life peerage as Baron Carson of Duncarrah.

He was twice married—in 1879 to Sarah A. F. Kirwan, who died in 1913, leaving two sons and a daughter; and in 1914 to Ruby Frewyn, by whom he had one son.

(G. E. B.)

CARTWRIGHT, SIR RICHARD JOHN (1835-1912), Canadian statesman (see 5.433), died at Kingston, Ont., Sept. 23 1912.

CARUSO, ENRICO (1873-1921), Italian operatic tenor, was born in Naples, Feb. 25 1873. He was early apprenticed to a mechanical engineer. He began to sing in the choirs at Naples when he was 11, and later studied for three years under Guglielmo Vergine. He made his début in 1894 in L'Amico Francesco at the Teatro Nuovo, Naples. He first won marked success as Marcello in La Bohème, at Milan, in 1898; and at La Scala theatre in that city, he sang for the next four years. From 1899 to 1905 he was at St. Petersburg in the winter, and in the summer at Buenos Aires. But meanwhile he appeared also in many cities, including Moscow, Warsaw, Rome, Paris and London (Covent Garden 1902), everywhere being warmly greeted. In America he first appeared in 1903 at the Metropolitan Opera House, New York, where for 18 years he was the leading tenor. He made an extensive concert tour through the United States in 1917. He had a very extensive Italian and French repertory, but never essayed Wagnerian rôles. He won special success in Aida, Carmen, Huguenots, L'Elisir d'Amore, Pagliacci, Rigoletto and Samson. He died Aug. 2 1921 at Naples.

CARY, ANNIE LOUISE (1847-1921), American singer (see 5.438), died April 3 1921 at Norwalk, Conn.

CASEMENT, ROGER DAVID (1864-1916), British consular official and Irish traitor, was born near Dunedin, New Zealand, in 1864. His family were Protestants who migrated to Ulster from the Isle of Man early in the 18th century, and he was brought up in the Protestant faith. Early in his career he was in the service of the Niger Coast Protectorate, afterwards entering the British consular service, and being appointed to Lorenzo Marques (1893), Loanda (1898) and to the Congo Free State (1898). After seven years on the Congo he was transferred to South America, going to Santos (1906), to Pará (1907) and to Rio de Janeiro as consul-general (1908). In 1910, charges of cruelty having been brought against the agents of the Anglo-Peruvian Amazon Co., operating in the region of the Putumayo, a tributary of the Upper Amazon, Casement was commissioned by the British Government to inquire into these charges on the spot. The result of his investigations was published as a Blue Book in 1912, and public opinion was deeply shocked by the evidence it contained of the appalling atrocities committed on the natives employed in collecting rubber (see PUTUMAYO). For this service he was knighted. His mind, however, seems to have been affected as the result of his experiences in the tropics, and on his return to Ireland from South America he developed a fanatical hatred of England, throwing himself with ardour into the movement for Irish independence.

As early as Jan. 1913 Irish Freedom, a Sinn Fein monthly review, had foretold the coming war with Germany and proclaimed this as "Ireland's opportunity," and to the July number of this review Casement, under the pseudonym of San Van Vocht, contributed an article on "Germany, Ireland, and the next War," in which he elaborated this theme. From the first he took an active part in the Volunteer movement in the south, and when, in the spring of 1914, the bulk of the Volunteers ranged themselves under Mr. Redmond's leadership (National Volunteers) he attached himself to the Sinn Fein section, which refused all compromise (Irish Volunteers). He had in the previous year made efforts, in concert with Mrs. J. R. Green and Capt. White,
CASHIN—CASTELNAU

587
to organize in the north counter-demonstrations of Protestants against the Ulster movement which culminated in the swearing of the Covenant; but these efforts were a complete failure.

After the outbreak of the World War Casement went to the United States, whence he wrote in Oct. urging Irishmen to stop in Ireland, "as they have no quarrel with Germany." In Nov. he went to Berlin and a communique from the German Foreign Office, published in the official North-German Gazette, stated that he had been given assurances there with regard to Ireland in the event of a successful German invasion of Great Britain. A pamphlet by him, entitled The Crime against Ireland and how the War may help it, appealing for a German-American-Irish alliance, was disseminated in the United States as part of the German propaganda. In Feb. 1915 he wrote an "open letter " to Sir Edward Grey accusing the British Government of conspiring against his life. During that year he visited the prison camps in Germany and tried, with very poor success, to undermine the loyalty of Irish soldiers who were prisoners of war, making them alluring promises if they would join an Irish brigade to fight for Ireland against Great Britain. He succeeded in keeping in touch with the extreme elements in Ireland and in arranging with them the rebellion planned for Easter week 1916, of which he himself proposed to take the lead. On April 12 he sailed for Ireland in a German submarine, which was accidentally mined by a vessel laden with arms and ammunition, and purporting to be the Norwegian s.s. "Auk." They reached the coast of Kerry on the 21st; but the Government was forewarned. The "Auk" was captured by a British patrol boat and sunk by her own crew while being taken to Queenstown. Casement, who with two companions had landed in a collapsible boat at Banna, was arrested on the 24th in a ruined fort which afterwards became a place of pilgrimage for Sinn Fein Irishmen. He had meanwhile succeeded in sending a message to Dublin, announcing the capture of the "Auk" and advising the postponement of the enterprise. This action, which really broke the back of the rebellion, was accomplished by a single small patrol ship, of which, it is said, even ascribed their misfortunes to his insane belief in his own superhuman powers.

Immediately after his arrest Casement was taken to London, and on May 15 was charged at Bow Street police court with high treason, and committed for trial. The trial began on June 26 before the Lord Chief Justice and two other judges. On June 29 he was convicted and sentenced to death, and on the following day was degraded from his knighthood. The Court of Criminal Appeal dismissed his appeal against conviction on July 18, and he was executed in Pentonville prison on Aug. 3, having been received into the Roman Catholic Church just before his death.

SIR L. G. REDMOND and Howard, Sir Roger Casement a Character Sketch without Prejudice (1916). Also a sketch by McQuillan in The Sunday Herald (April 30 1916), and the White Paper issued by the British Government, Documents relating to the Sinn Fein Movement (Cmd. 1168).

CASHIN, SIR MICHAEL PATRICK (1864– ) , Newfoundland politician, was born at Cape Breton, Newfoundland, Sept. 29 1864. He was educated at St. Bonaventure's College, St. John's, and afterwards adopted a business career, becoming a fishery merchant at Cape Breyle in 1885. In 1893 he entered politics as Liberal member for Ferryland, becoming a prominent member of the party. In 1905, however, he broke away from the Liberals, joining first the Independent Liberal party, and later (1908) the People's party led by Sir Edward (afterwards Lord) Morris. He was chosen to represent Newfoundland on the Commission on West Indian Trade held at Jamaica in 1901, and after the outbreak of the World War occupied various important political posts. In 1917 he became Minister of Finance, and as such was largely instrumental in raising the Victory loan, and in 1918 he was successively acting Prime Minister during the absence of Lord Morris, acting Minister of Militia and acting Minister of Shipping. He was in the same year created K.B.E.

CASSEL, SIR ERNEST JOSEPH (1852–1921), Anglo-Jewish financier, was born at Cologne March 3 1852. His father, Jacob Cassel, was a small banker in that city, and the son at the age of 16 became a clerk in the banking firm of Elspacher, but in 1870 came to London and entered the foreign banking house of Bischofsheim and Goldsmid. There, before he was 20, he attracted notice by his skilful disentanglement of the accounts of the Khedivial loans. In 1884 he set up for himself and became largely interested in South-American finance. He reorganized the finances of Uruguay, and issued three Mexican loans, as well as acquiring the Royal Swedish railway and financing enterprises such as Vickers' absorption of the Maxim-Nordenfelt Co. and the building of the Central London railway. He also raised a Chinese loan after the war with Japan. His principal achievement was, however, the financing of the Nile irrigation work, and in connexion with that, the founding of the National Bank of Egypt. In these schemes he worked hand in hand with Lord Cromer. For these services he received a Privy Councilorship in 1902 and was created K.C.V.O. He had previously been created K.C.M.G. (1890) and he subsequently received the G.C.M.G. (1905), the G.C.V.O. (1906) and the G.C.B. (1909).

CASTELNAU, EDOUARD DE CURIERES DE (1831– ), French general, third son of the Marquis Michel de Curières de Castelnau, was born at Rouergue on Christmas Eve 1831. He was educated first at the Jesuit college there, and later in Paris, for entrance at St. Cyr in 1850. When war broke out with Prussia the young cadet was posted to an infantry regiment, and he rose to the rank of temporary captain, being given a permanent commission as lieutenant when peace was made. He was promoted captain in 1876 and commandant in 1880. By 1893 his genius for organization had become apparent, and he was called to Paris by Gen. de Miribel. He remained at the Ministry of War for some six or seven years, during which time he perfected the French system of mobilization. That system remained in 1914 fundamentally the same as it had been conceived by him in 1900.

On leaving Paris de Castelnau was promoted colonel. He was later given command of a brigade, and, in 1910, of a division. When Gen. Michel left the post of generalissimo and Joffre was appointed in his stead, Castelnau was designated as his chief-of-staff in case of war. But his religious and political views—he
was nicknamed le capucin bête—caused him to be regarded with suspicion, and in consequence he was designated for the command, in case of war, of the II. Army in Lorraine, which command, on the outbreak of hostilities in 1914, he assumed. With Gen. Dubail (I. Army) he was responsible for the operations of Aug. and Sept. 1914 in Lorraine. The first offensive towards the Saar was unsuccessful, but his repulse of Prince Rupprecht's VI. Army on the heights of the Grand Couronné, in Aug., was a splendid victory, not only capturing Nancy but paved the way for the Marine victory. He was made grand officer of the Legion of Honour. In the beginning of the "Race to the Sea" (Sept.–Oct.) the II. Army staff and its leader took command of the forces that were pushed into the region between the Oise and the Somme, and fought a series of encounter battles which ended in the stabilization of the front. In 1915 he took command of the group of four armies which constituted the French Centre, and he was in charge of the French offensive in Champagne in the latter months of the same year. On Dec. 10 1915 he was appointed "major-general of all the armies," with the intention that he should be ad latere, and eventual successor of Joffre. But in practice, and partly as the result of political intrigue against him, Castelnau's rôle was reduced to that of occasionally representing the commander-in-chief. It was in this capacity that he went to Salonika in the winter of 1915-6 to inspect the condition of affairs there, and it was in this capacity also that he performed his greatest service to France when, summoned at a moment's notice to Verdun, he found the defence overpowered and disorganized by the suddenness of the German attack. The splendid part he played in steadying and inspiring the historic French resistance cannot easily be exaggerated. After a few days' work he was able to hand over the defence, systematized, reinforced and concerted, to Pétain. In Jan. 1917 after the appointment of Nivelle, many years his junior, to the chief command, he was sent on a mission to Russia. Returning in March of the same year he was given command of the eastern group of armies, and in this appointment he remained till the end of the war. In Sept. 1917 he was awarded the médaille militaire. Political animosities alone prevented his being promoted to the dignity of Marshal of France, along with D'Espérey, Lyautey and Fayolle, in 1921.

CAVALRY: see MOUNTED TROOPS.

CAVE, GEORGE CAVE, 1st Viscount (1856–1925), British politician and lawyer, was born in London Feb. 23 1856. He was educated at Merchant Taylors' school and St. John's College, Oxford, and was called to the bar in 1880. He practised at the Chancery bar, and in 1904 became a K.C. In 1906 he was elected Unionist M.P. for Kingston, and on the formation of the Coalition Government in 1915 was made Solicitor-General and knighted. He became Home Secretary in 1916 on the accession of Mr. Lloyd George to power, and in this capacity was very prominent in the debates in the House of Commons on the police strike of Aug. 1918. In Nov. 1918 he resigned office, and was created a viscount, becoming in Jan. 1919 a lord of appeal.

CAVEILLÉ, EDITH (1865–1915), British nurse, was born Dec. 4, 1865 at Swardenar, Norfolk, the daughter of the Rev. Frederick Cavell, vicar of that parish. She was educated at various schools in England and in Brussels, and entered the London hospital as a probationer in 1895. After five years at the hospital she was successively night superintendent at the St. Pancras infirmary, assistant superintendent at Shoreditch infirmary and matron at the Ashton New Road district home, Manchester. In 1907 she was appointed the first matron of the Berkendael medical institute, Brussels, a surgical and medical home founded by Dr. de Pago as a pioneer training school for Belgian secular nurses. The institute became a Red Cross hospital on the outbreak of the World War, in which Belgian, German, French and English soldiers were nursed. From Nov. 1914 to July 1915 wounded and desert English and French soldiers and Belgians and French of military age were hidden from the Germans and provided with false papers by Prince Reginald de Croy at his château of Béllignie near Mons; thence conducted by various guides to the houses of Edith Cavell, Louis Séverin and others in Brussels, and furnished them with money to reach the Dutch frontier and with guides obtained through Phillipe Bauq. On Aug. 6 Edith Cavell was arrested at the Berkendael institute and sent to the prison of St. Gilles. She made three depositions to the German police, Aug. 8, 18, and 22, admitting that she had been instrumental in conveying about 60 English and 15 French derelict soldiers and about 100 French and Belgians of military age to the frontier and had sheltered the greater number in her house. Thirty-five veterans of the court-martial was held, Oct. 8 and 9, before Dr. Stoecher and five judges, and a Belgian lawyer, M.M. Sadi Kirschens, defended Edith Cavell. On Oct. 9 Edith Cavell, Louise Thuliez, Phillipe Bauq, Louis Séverin and Countess Jeanne de Belleville were secretly sentenced to death; and of the remaining 30, 22 were sentenced to imprisonment and 8 acquitted. On the 10th the sentence was announced in secret to the prisoners. Gen. von Sauberzeweg, the military governor of Brussels, ordered that "in the interests of the State" the execution of the death penalty against Bauq and Edith Cavell should be carried out immediately. At 7 a.m. on Oct. 11 they were shot at the Tir National, Brussels, in spite of the energetic efforts to secure delay made by the American minister, the secretary of the American legation and the Spanish minister, who first became aware of the sentence during the night of the 10th. The other three were reprieved. These were the first death sentences imposed by the Germans in Belgium for recruiting as opposed to espionage. On May 15 1919 the body was removed to Norwich cathedral, after a memorial service in Westminster Abbey. A memorial statue, by Sir G. Frampton, is erected opposite the National Portrait Gallery, London.

See The Case of Miss Cavell from the Unpublished Documents of the Tribunal, interpreted by Ambrose Oot; Sadi Kirschen, Devant les Conseils de Guerre Allemands (1910); Correspondence with the United States Ambassador respecting the Execution of Miss Cavell at Brussels, C. 603, Stationery Office (1915).

CAVIGLIA, ENRICO (1862–1940), Italian general, was born at Finalmarina (Genoa) May 4 1862. He entered the artillery, and his early years in the army were spent between this branch of the service and the general staff, but on attaining his majority he passed to the infantry arm. He served in Eritrea and in the Italo-Turkish War and, as a captain of the general staff, was attached to the Japanese army during the Russo-Japanese War. In Feb. 1914 he was nominated vice-director of the Military-Geographical Institute in Florence. On Italy's entry into the World War he served as a colonel on the general staff, and in Aug. 1915 he was promoted to major-general and given command of the Bari Brigade. In June 1916 he took over the 29th Div. and two months later was promoted lieutenant-general "for war merit." In July 1917 he was given command of the XXIV. Corps, which under his direction broke through the Austrian lines on the Bainsizza plateau. After Caporetto he took command of the VIII. Corps and subsequently of the X., and in June 1918, after the Austrian offensive on the Piave, he was chosen to command the VIII. Army. Under his leadership the VIII. Army played an important part in the final victory of Vittorio Veneto. From Jan. to June 1919 Caviglia was Minister of War, and as such became a senator, and in Nov. of the same year he was promoted army general. In Jan. 1920 he took over the command of the troops in Venezia Giulia, with headquarters at Trieste. He had a very difficult task to perform, since the discipline of the troops had been severely shaken by the example of D'Annunzio's Fiume raid, and there was danger of trouble on the frontier with the Yugoslavs. Caviglia restored discipline, and showed both firmness and tact in dealing with these delicate problems. When it became evident that only force would drive D'Annunzio from Fiume he did not hesitate to carry out his task.

CECIL, LORD HUGH RICHARD HEATHCOTE (1869–1943), English politician (see 24,76), youngest son of the 3rd Marquess of Salisbury, was born Oct. 14 1869, and was educated at Eton and University College, Oxford. He obtained a first class in history in 1891 and was elected a fellow of Hertford College. He gained his first insight into politics as one of his father's private secretaries, and was returned to Parliament as a Conservative for Greenwich in 1895. Ecclesiastical questions were
those in which he took the keenest interest, and he became an active member of the Church party in the House, resisting the attempts that were made by Nonconformists and Secularists to take the discipline of the Church out of the hands of the archbishops and bishops, and to remove the bishops from their seats in the House of Lords. In these debates he showed remarkable oratorical power and loftiness of tone, and established a reputation which was confirmed and heightened during the progress through Parliament of Mr. Balfour’s Education bill of 1902. In an earnest speech on the second reading he maintained that for the final settlement of the religious difficulty there must be cooperation between the Church of England and nonconformity, which was the Church’s natural ally; and that the only possible basis of agreement was that every child should be brought up in the belief of its parents. The ideal to be aimed at in education was the improvement of the national character. In the latter stages of the bill’s progress he warmly resented an amendment approved by the House and taken over by the Ministry giving the managers, instead of the incumbent of the parish, the control of religious education in non-provided schools. This was not the only point on which he showed considerable independence of the Government. Objecting to the measure, his cousin Mr. Balfour was the head. He and Mr. Winston Churchill gathered round them a small group of young and able Conservative members, whose independent proceedings attracted some attention in Parliament, and who formed a sort of pale reflection of Lord Randolph Churchill’s Fourth party. He dissented from the beginning from Mr. Joseph Chamberlain’s policy of tariff reform, pleading in Parliament against any lowering of our idea of empire into that of a “gigantic profit-sharing business.” He took a prominent position among the “Free Food Unionists,” and consequently was attacked by the tariff reformers and lost his seat at Greenwich in 1906. He did not return to Parliament until 1910 when his high character and his academic outlook recommended him, in spite of his hostility to tariff reform, as a fitting member for Oxford, his own university. He threw himself immediately with passion into the struggle against the Ministerial Veto Resolutions, comparing the Asquith Government to “thimble-riggers.” In the next year he was active in the resistance to the Parliament bill, treating Mr. Asquith as a “traitor” for his advice to the Crown to create peers, and taking a prominent part in the disturbance which prevented the Prime Minister from being heard on July 24, 1911. He opposed the authority which he had possessed in the House in the early years of the century. He strongly opposed the Welsh Church bill; and he denounced the Home Rule bill, in a picturesque phrase, as reducing Ireland from the status of a wife to that of a mistress—she was to be kept by John Bull, not united to him. During the World War Lord Hugh joined the Flying Corps, becoming a lieutenant R.F.C. in 1915, and in that capacity he never censured, in debate in 1918, the treatment of Gen. Trenchard by the Government. He also served in 1917 as a member of the commission to enquire into the Mesopotamian expedition. In Parliament he pleaded for lenient treatment of conscientious objectors to the Military Service bills; and endeavoured unsuccessfully to relieve them of disability under the New Reform Act. After the war he took a less active part in politics, but generally found himself in agreement with his brother Lord Robert, whom he followed into Opposition in 1921.

(C. E. B.)

CECIL, LORD (EDGAR ALGERNON) ROBERT (1864— ), English lawyer and statesman (see 24.76), third son of the 3rd Marquess of Salisbury, was born Sept. 14 1864. Educated at Eton and University College, Oxford, he obtained a second class in law in 1886. He was a prominent speaker at the Oxford Union, and obtained political experience as one of his father’s private secretaries from 1886 to 1888; but he determined to approach an active political career by way of the bar, and was called by the Inner Temple in 1887. He made such progress in his profession that he could take silk in 1890; and he established his position as a sound lawyer and capable advocate. It was not till 1906 that he entered Parliament as Conservative member for E. Marylebone, and he was one of the principal critics of Mr. Birrell’s abortive Education bill of that year, contending throughout that facilities should be afforded for the training of children in the religion of their parents. In this he carried on the work of his younger brother, Lord Hugh Cecil, now out of Parliament. But, though a vigilant champion of Church interests, as for instance in opposition to the Deceased Wife’s Sister’s bill, he also took up, in conjunction with Mr. Harold Cox on the Liberal side, an attitude of individualist opposition to Socialist measures, such as Minimum Eight Hours, Old Age Pension, and Increment Taxation bills. He also dissociated himself from the tariff reform policy of his party. He had won a leading place among the private members of the House, when Parliament was dissolved in 1910. He then retired from Marylebone, owing to the strong opposition of the tariff reformers, and failed to secure election as a Unionist free trader at Blackburn. In the second General Election of 1910 he stood for N. Cambridgeshire but was beaten by Mr. Nell Primrose. However, he returned to Parliament at a by-election in 1912 as member for the Hitchin division of Herts, the tariff reform issue being now in abeyance. He immediately resumed his prominent position in the House, and was active in his opposition to schemes of socialism and disestablishment. He was a leading advocate of woman suffrage; and, though not palliating militancy, was a strong critic of forcible feeling. Ultimately, after women had been granted the suffrage under the Reform Act of 1918, he had the satisfaction of carrying a resolution permitting them to sit in Parliament.

By the time of the outbreak of the World War his claims to recognition among the Unionist leaders were so considerable that he was appointed Under-Secretary for Foreign Affairs in the first Coalition Ministry. His functions mainly concerned the vitally important question of blockade; and when there was a considerable outcry against the comparative ineffectiveness of our blockade, a new Ministry of Blockade was constituted, in Feb. 1916, with Lord Robert as minister. In that capacity he announced in June 1916, to the general satisfaction, that the Allies had decided to abandon altogether the Declaration of London. His work was so much appreciated that he was retained both as Minister of Blockade and as Foreign Under-Secretary in Mr. Lloyd George’s Ministry of Dec. 1916. In July 1918 the labours of the Foreign Office became so considerable that he was relieved of the Ministry of Blockade, and became Assistant Secretary of State for Foreign Affairs. After a short time he was appointed Viceroy of India, and which resulted eventually in the Armistice; but he resigned on the eve of the General Election, on the ground that he could not support the decision of the Coalition Ministry to treat Welsh disestablishment as a fait accompli. Though out of office, he nevertheless went over to Paris in 1919 to help to fashion the League of Nations, of which from the first he was an enthusiastic advocate. He was subsequently indefatigable in pressing its claims upon Parliament and people, urging that the sooner enemy nations, including Germany, could be included in it with safety, the better. In 1920 he attended the first assembly of the League at Geneva as the representative of South Africa at the request of Gen. Smuts, himself a convinced believer in this new international organ. He also took a large share in Parliamentary debate, appearing, for instance, as a strong supporter of the Church Enabling bill, and criticizing the policy of the War Graves Commission and the regulation headstone which it recommended. In spite of his protestation, when he left the Government, that except on the one point of the Welsh bill, he was a convinced supporter, he steadily drifted into opposition, being especially alienated by their gigantic budgets, and by the policy of re-primis in Ireland. At one time both Tory and Liberal Viscount Morley were in the future, and when he ultimately took his seat on the Opposition front bench in 1921, he did not appear to carry anyone across the House with him, except his brother, Lord Hugh.

Lord Robert Cecil married, in 1889, Lady Eleanor Lambton, daughter of the 2nd Earl of Durham.

CELLULOSE (see 5.606).—The decade following the year 1910, including the experiences of the World War, fully confirmed
of village; opened in 100 the referred is ultimate is dextrose; as reaction main conversion extended. Lastly, The Ost large negative

These rediscovering considerations progressive by humus-lignite (b) range are to a technology of "Nitro Cellulose Industries." In evidence of the rapid growth of the subject in its wider aspects we may refer to the same author's treatise (projected in 1921), to be issued in ten volumes over a period of years.

Progress of investigation and knowledge of cellulose as a chemical individual was in 1921 more definitely marked as following three independent lines, obviously converging towards a constitutional formula or expression: (1) The study of cellulose as it is; a colloidal substance, perhaps the prototype of colloids, and of its immediately related derivatives, having closely similar physical properties. (2) The study of its resolutions by reaction to compounds of C6-C5 dimensions, also carbo-hydrates, which are presumed to be actual components, and, being compounds of known constitution, to be the foundation of an integral formula of constitution of the parent substance. With this primary or fundamental method is associated the study of the whole range of reactions and interactions of cellulose as diagnostic of its component groups. (3) The study of resolutions (a) to highly complex mixtures of products, by destructive distillation, or by natural processes of which the ultimate residual products are humus-lignite coal; (b) to ultimate products of C5-C dimensions by symbiotic bacterial process of decomposition. Of the above, No. 2 is the line or method of systematic chemistry, and its exponents detach themselves in the main from all considerations of the natural history and physiology of the celluloses: their organized structure and colloidal characteristics are treated as of subordinate moment, and the technology of the cellulose industries is for the most part ignored. Nevertheless, the contributions for this field of workers are of first importance.

The following are to be noted:—

Resolution to Dextrose by ester formation, solution in water, and progressive hydrolysis of esters: (a) Reaction with HSO4—Ost & Wilkening (1910–3) confirm Fleisch (1882) in the general conclusion that cellulose is quantitatively converted to dextrose; (b) reaction with HClO4, Wunder and Zechmeister (1913), rediscovering the solvent action of the acid at maximum concentration (W. A. Miller, Organic Chemistry, p. 130, ed. 1890), apply the reaction to an analogous process of resolution and further confirm the generally accepted relationship.

Resolution to Biore (cellulose) and Monose (dextrose) following conversion into (a) acetic ester and (b) methyl and ethyl ethers or ethoxides (c) mixed (acetic) ester—ether derivatives. By the former, Ost has demonstrated the production of the biore as acetate with the monose as pentacetate, the joint yield calculated to the monose representing 90% of the cellulose. By resolution of the methox ide derivatives Denham and Woodhouse obtain 1,2,5—trimethyl glucose and establish a critical constitutional point in regard to current discussion of the several alternative formulae based on the general acceptance of the quantitative cellulose—dextrose relationship. The "acetylation" of the ethoxides has been specially investigated by Hess and Wittelsche.

Resolution by Heat to Laavo—glucosan.—A direction of research of critical importance is opened up by A. Picot and co-workers, and subjecting cellulose (starch and glucose) to distillation in vacuo (12.14 mm. at 210°) with production of laavo-glucosan

\end{align*}
\]

in large yield (40%).

These notes are sufficient as evidence of the rapid advance of knowledge due to the active work and discussions of the chemists whose "ultima thule" is expressed by a recent contributor—"the time would now seem to be opportune when the question of direct synthesis should be undertaken." This project issues from a comprehensive critical discussion of the research work of the last decade (H. Hibbert, "The Construction of Cellulose," Jour. Ind. Eng. Chem. 13 (1921), 256 et seq.), of which the following is characteristic—"Cellulose is thus nothing more than a polymerised dextrose glucoside of dextrose.

Lastly, as a negative point and a general criticism of the conclusions of the school of systematic chemists, the cellulose—dextrose relationship postulating a conversion of 100 of cellulose to 111 dextrose is not established. Research in this field is limited to cotton cellulose. If extended to esparto cellulose (a type sharply and characteristically differentiated), to the wood celluloses, or even to cotton cellulose modified by mercerization and other treatments yielding products which maintain the structural characteristics, it would be recognized in the results that the "construction of cellulose" is a problem of the dimensions of a continent rather than of a village: or possibly, that the "synthesis of cellulose" is an ideal, illusory, however useful. (The reader is referred to C. F. Cross, "Cellulose," J. R. Soc. Arts 1920; and to papers by same author in J. Soc. Dyers and Coli, 1918–20.)

Cellulose Products in War Service (1914–8).—The following note on the development of the technology of the cellulose nitrates to meet the exacting requirements of the fighting services is contributed by Sir R. Robertson, who, as director of research at Woolwich, was responsible for the chemical technical control of the manufacture.

In England cellulose nitrates were used during the war in the Land Service for the manufacture of cordite R.D.B., and for Admiralty cordite; towards the end of the war a small proportion was used for making nitro-cellulose powder. By far the largest use was for cordite R.D.B., as this propellant was ultimately manufactured at the rate of about 5,000 tons a week, involving the nitrating of about 700 tons of purified cellulose. For Admiralty cordite over 100 tons a week of sliver cotton was prepared, this material being specially selected and purified. The cotton for the nitro-cellulose powders was a high grade of "liners."

The preparation of cellulose for the Land Service assumed the proportion of a great industry. The raw materials were drawn from wastes from the spinning-mills not only of England, but also of Egypt, India, and of other countries. It was soon found that the variations in treatment of the crude wastes produced a product which gave variable results after it had been nitrated, especially when it remained for long periods in its incorporate nitrate—nitrating glycerine and gelatinization by means of alcohol. All the materials for producing cellulose for nitration were therefore coordinated under the Department of Explosives Supply, which instituted a system of chemical control of the product, with the objects of obtaining uniformity of production, reducing the quantity of impurities, and obtaining a suitable low viscosity.

A uniform process of "kiering" (boiling under pressure with a lye of caustic soda) was introduced, and under strict supervision a
The compound-celluloses. — The lignocelluloses, represented by the typical fibre-substance of jute (bast-fibre), are the subject of a recent monograph bearing the title, "Colloidal Tannin Compounds" (C. F. Cross and others), J. Soc. Dyers and Colourists for 1928.

The lignocelluloses—terminals lignocelluloses—the wood cell wall or plant fibre contains two phases, the cellulose and lignin. The cellulose is a long polymer of glucose units, and lignin is a complex mixture of phenolic compounds. The lignocelluloses are used in the production of paper, cardboard, and a variety of other products. The cellulose phase is hydrophilic and absorbs water, while the lignin phase is hydrophobic and resists degradation.

CENSORSHIP. — The World War brought about various forms of restriction of publicity in the shape of a censorship, which provides a new chapter in the history of the Press Laws (see Censorship).

The Admiralty War Office and Press Committee. — At a meeting of the Admiralty War Office and Press Committee, held this afternoon, it was resolved that as in view of the present situation, the authorities may have to take exceptional measures, it was desirable to publish any information relative to movements of British warship, troops, and aircraft, or to war material, fortifications, and naval and military defences, without first communicating with the Admiralty and War Office regarding the same. Such preliminary arrangements were not to prevent the appearance of anything concerning steps of an exceptional kind which may be rendered necessary by the existing state of affairs.

I may add that the authorities from time to time will continue to issue such information as may be judged advisable in the interests of security. The "Admiralty War Office and Press Committee" had been formed in 1911, mainly through the efforts of Sir Reginald Brade, to establish a permanent "laisser en peine" of war between the Admiralty and the War Office on the one hand and the Press on the other. The Committee consisted of representatives of the two departments and the London and provincial newspapers. Apart from the Official Secrets Act, there was no legislation which enabled the authorities or the Committee to suppress the publication of naval and military information. Notwithstanding this, the whole of the newspapers loyally observed the Committee's request, followed by others of a more detailed character, dated July 29 and 30 respectively. The result was that a considerable amount of official secrecy which the Germans subsequently admitted that on Aug. 20 they knew neither when nor where the British troops were landed, nor their strength.
CENSORSHIP

On Aug. 7 the Press Bureau (the outward and visible sign of the censorship) was established by Lord Kitchener, acting in conjunction with Mr. Churchill, then First Lord of the Admiralty. The first Director of the Bureau was Mr. F. E. Smith, M.P., afterwards Lord Birkenhead. He was followed by Sir Stanley (afterwards Lord) Buckmaster, who was succeeded by Sir Frank Swettenham jointly with the late Sir Edward Cook. In the first instance the Bureau was located in a tumble-down building in Whitehall, backing on to the Admiralty. Later it was removed to the United Service Institution.

The objects of the Press Bureau were:
(a) The censoring of incoming and outgoing press cables and certain inland press messages, chiefly those passing through the General Post Office. By order of the Government the former were diverted to the Bureau by the Post Office and cable companies.
(b) To issue to the newspapers official information received from other Government departments.
(c) To censor matter voluntarily submitted by the Press.

It should be mentioned here that the censoring of news by the Bureau was, for the most part, carried out in accordance with the wishes of the various Government departments concerned—

the Admiralty, the War Office, the Foreign Office, the Home Office, etc., with the result that the whole of the criticism was directed against the Bureau, which served as a sort of buffer state. In short, the Directors of the Bureau had to do as they were told. It was an open secret that in some instances they disagreed with the policy they were called upon to enforce. On the whole they performed a thankless duty with considerable ability. Upon Lord Birkenhead fell the difficult task of organizing the department and establishing regulations to deal with conditions altogether unprecedented. The work of his successors was hardly less onerous as fresh problems constantly presented themselves throughout the war. About fifty censors were employed, comprising naval officers (appointed by the Admiralty), military censors (appointed by the War Office), and civilians, including ex-civil servants, barristers and journalists.

The Bureau was kept open day and night. On Aug. 8 1914 the Defence of the Realm Act was passed, followed a few days later by a series of censorship regulations as authorized by its provisions. These regulations were of a far-reaching character. They were amended from time to time and in their final form stood as follows:

Reg. 18. No person shall, without lawful authority, collect, record, publish or communicate, or attempt to elicit, any information with respect to the movement, numbers, description, condition and disposition of any of the forces, ships, or aircraft of His Majesty or any of His Majesty's allies, or as respects the plans of war, or of any such forces, ships, or aircraft, or with respect to the supply, description, conditions, or manufacture, or storage, or place or intended place of manufacture or storage, or war material, or with respect to any works or measures undertaken for or connected with, or intended for the fortification or defence of any place, or any information of such nature as is calculated to be or might be directly or indirectly useful to the enemy, and if any person contravenes the provisions of this regulation, or without lawful authority or excuse has in his possession any document containing any such information as aforesaid, he shall be guilty of an offence against these regulations.

Reg. 27. No person shall by word of mouth or in writing or in any newspaper, periodical, book, circular, or other printed publication—
(a) Spread false reports or make false statements; or
(b) spread reports or make statements intended or likely to cause disaffection to His Majesty, or to interfere with the success of His Majesty's forces or of the forces of any of His Majesty's allies by land or sea, or to prejudice His Majesty's relations with foreign powers; or
(c) spread reports or make statements intended or likely to prejudice the recruiting of persons to serve in any of His Majesty's forces, or in any body of persons enrolled for employment under the Army Council or Air Council or entered for service under the direction of the Home Office, or the police force or fire brigade, or to prejudice the training, discipline or administration of any such force, body, or brigade; or
(d) spread reports or make statements intended or likely to undermine public confidence in any bank or currency notes which are legal tender in the United Kingdom or any part thereof, or to prejudice the success of any financial measures taken or arrangements made by His Majesty's Government with a view to the prosecution of the war; . . .

The maximum penalty was imprisonment with or without hard labour for six months or a fine not exceeding £100, or both.

Prosecutions had to be instituted by the Director of Public Prosecutions in England, by the Lord Advocate in Scotland, or the Attorney-General in Ireland. The Regulations (Reg. 51) gave the Government power in certain cases to seize the incoming of a newspaper which had offended, or in others to seize the type on suspicion that an offence was about to be committed (Reg. 519). These regulations placed heavy shackles upon the Press, but in the main they were accepted with patriotic equanimity. Prosecutions were few in number, which is surprising considering the length and magnitude of the war. It will be seen that the Press Bureau had no power to insist upon the submission of matter for censorship. The responsibility rested with the editor, who could publish what he thought fit, subject to complying with the Defence of the Realm Regulations. If he erred he was liable to prosecution, and even if the matter were passed he would not be relieved of the responsibility for infringement of the regulations, although the fact might be pleaded in mitigation.

From time to time secret instructions were issued by the Bureau for the information and guidance of editors. At the end of the war these numbered several hundred. At intervals they were collected and issued in pamphlet form. For the most part they consisted of hints and elucidations concerning matters which in general terms were covered by the regulations quoted above.

Postal and Press Censorship. In addition to the Press Bureau, censureships of incoming and outgoing cables, letters and parcels, were established by the War Office at the commencement of the war with the three-fold object of preventing information of military value from reaching the enemy, of acquiring similar information for British purposes and of checking the dissemination of information likely to be useful to the enemy or prejudicial to the Allies. Chief Censors of both departments were appointed by the Army Council.

The cable censorship extended throughout the Empire, and the number of persons employed in the United Kingdom, exclusive of those in the Press Bureau, was about 200. In other parts of the Empire they numbered about 1,000. The size of the task may be judged from the fact that 30,000 to 50,000 telegrams passed through the hands of the censors in the United Kingdom every twenty-four hours.

In the postal censorship, exclusive of clerical and post-office employees, a staff of 5,500 was employed comprising 3,451 women and persons with a knowledge of almost every foreign language. The department was divided into three branches—

(1) the section which censured the correspondence of prisoners of war in the United Kingdom and British prisoners in enemy countries;
(2) the private correspondence section which dealt with letters from members of the British Expeditionary Force, letters and parcels to and from certain foreign countries, press messages sent abroad by other means than cable, and newspapers.

In this branch more than a ton of mail matter was censored every week, exclusive of parcels; (3) the trade branch, which censored commercial correspondence with certain foreign countries, amounting to nearly four tons per week.

At the commencement, the system caused serious irritation amongst the commercial classes, to which point was given by foolish and, in some cases, amusing errors made by the censors. It must, however, be recognized that on the whole the work was well and efficiently done. The officers chiefly responsible were Gen. (afterwards Sir George) Macdonough, Gen. Cockrell, Col. A. E. Churchill followed by Lord Arthur Browne, Chief Cable Censor, and Col. G. S. H. Pearson followed by Col. A. S. L. Farquharson, Chief Postal Censor.

In the early part of the war a great outcry was made by the British (and also the American) newspapers concerning the working of the Press cable censorship in London. In numerous instances, Press cables received in England were entirely suppressed without notice to the sender or addresser, and in others
messages were so mutilated as to be indecipherable. These complaints led to a declaration by the Foreign Office on Dec. 20, 1915, that in future incoming press cabledgrams would not be censored from a political point of view; the responsibility of publishing would be with the editors who knew that a prosecution against them, under the Defence of the Realm Act, might result from the publication of anything endangering the good relations between Great Britain and the Allies or the neutrals. This change, however, only applied to censorship by the Foreign Office, and messages were still liable to censorship from the point of view of other departments (Admiralty, War Office, Home Office or Treasury, for instance) consulted by the Press Bureau—a system which continued until 1919.

Censorship at the Front.—It remains to deal with the censorship of messages from authorized British correspondents on the several fronts. These were primarily (and compulsorily) censored by military censors on the field, but they all came through the Press Bureau, which occasionally exercised a super-censorship. The methods adopted caused constant grumbling and discontent.

The casualty lists were rigidly and, no doubt, properly suppressed, but owing to the representations of the Newspaper Proprietors' Association they were supplied periodically for the confidential information of editors.

In France, at the outset, no correspondents were allowed. In Sept., 1914, owing to demands by the Newspaper Proprietors' Association for more information, an official eye-witness, Gen. Swithin, was appointed. He wrote according to order, and no question of censorship arose. The news supplied was meagre and inappropriate, and it did not take long for mischievous results to accrue, and the official mind was at first disposed to blame the Press for what was wrong in the "publicity" of the moment. On March 12, 1915, the following notice was issued by the Press Bureau, warning the newspapers that they were too optimistic in the pictures they gave of what was happening:

"The magnitude of the British task in this great war runs serious risk of being overlooked by reason of exaggerated accounts of success and underestimation of the efforts and prowess of the enemy. The present is not the time to be exercised in the catching of the enemy's eye and magnifying comparatively unimportant actions into great victories. Reports reversing the enemy are proclaimed as crushing defeats. Germany is represented as within measurable distance of starvation, bankruptcy, and revolution, and only yesterday a poster was issued in London, declaring that half the Hungarian army had been annihilated.

"All sense of just proportion is thus lost, and, with these daily, and sometimes hourly, reports and posters, the public is supplied with reports which are not only rejecting the actual state of affairs, but are probably distorting them. The British soldier is to be encouraged to have a clear knowledge of the actual position, and to emphasize the efforts which will be necessary before the country can afford to regard the end for which we are fighting. We are not at this time, like ourselves, familiar with the evening papers, are very often preposterous as well as misleading, and, at such a time, those responsible may fairly be asked to exercise a reasonable restraint and help the nation to a just appreciation of the task it has undertaken and the necessity for unremitting effort to secure the end that can be accepted."

The newspapers did not take this notice "lying down." On March 26, 1915, the Newspaper Proprietors' Association, through its chairman Sir George (afterwards Lord) Riddell, sent the following letter to the Press Bureau, and copied to the Prime Minister, Mr. Winston Churchill, Lord Kitchener and other members of the Cabinet:

"The Council have had under consideration your Memorandum of 12th March, 1915, Serial No. D. 183, for which, in their opinion, there is no adequate justification. The Press has dealt faithfully with the news furnished by the naval and military authorities, but it is quite clear that the Public and Press alike are liable to misapprehension, and this misconception is producing serious results. If, however, the people are being unduly soothed and elated the responsibility lies with the Government and not with the Press. In this connection my Council desire to request your attention to the optimistic statements of the Prime Minister, Sir John French, 'Eye-Witness,' and other persons possessing official information. The Press acts upon the news supplied. If this is inaccurate or incomplete, the Government cannot blame the newspapers. My Council desire to represent that the methods now being adopted are fraught with grave public danger. Ministers are continually referring to the importance of energy and self-sacrifice on the part of the industrial population, who cannot be expected to display these qualities unless, generally speaking, they are acquainted with the facts. In dealing with the news, the Naval and Military authorities should consider not only our enemies and the army in the field, but the commercial and industrial classes at home, upon whom so much depends. It is futile to endeavour to disregard the long-established habits and customs of the people.

"As you know, I am writing on behalf of the London Press only, but I am sure that you are confident that their views are shared by the provincial newspapers."

The result of this letter was that Mr. Asquith invited the Association to lay their views before him at a deputation. A free exchange of views took place, with the result that Mr. Asquith invited the Press to appoint a representative who would interview Lord Kitchener and Mr. Churchill each week with the object of putting questions to them and receiving private information for circulation to editors. Lord Riddell was detailed for the duty, and had frequent interviews with Lord Kitchener.

As a result of further urgent representations by the Association, represented by Lord Burnham, Lord Northcliffe and Sir George Riddell, the following correspondents were authorized in May, 1915—Mr. John Buchan (Times and Daily News), Mr. Percival Landon (Daily Telegraph and Daily Chronicle), Mr. (afterwards Sir) Percival Phillips (Morning Post and Daily Express), Mr. Valentine Williams (Daily Mail and Standard), Mr. Douglas Williams (Reuters), Mr. John Buchan was succeeded by Mr. (afterwards Sir) Perry Robinson, Mr. Percival Landon by Mr. (afterwards Sir) Philip Gibbs, and Mr. Valentine Williams by Mr. (afterwards Sir) Beach Thomas. Mr. Douglas Williams was succeeded by Mr. Lester Lawrence and Mr. (afterwards Sir) Herbert K Danielle.

At the beginning, the regulations for the guidance of correspondents were as follows, but for the most part they were allowed to write as they wished:

"Unless officially communicated for publication," the undermentioned matters were not to be referred to:

- Strength, composition and location of forces.
- Movement of troops and operations.
- State of supply and transport.
- Casualties.
- Important orders.
- Criticisms and eulogies of a personal nature.
- Moral of troops.

Before long, however, the regulations were rigidly enforced, and an attempt was subsequently made to strengthen them. A fresh set of rules was promulgated at G.H.Q. in Nov., 1915. They took this form:

1. (1) Current events must not be mentioned in detail until the events have been made public in the commander-in-chief's despatches.
2. (2) Only general mention of the fighting can be made. Nothing outside the official communiques is to be touched upon.
3. (3) Matters of controversial or political interest must be excluded.
4. (4) Praise or censure is to be left to the commander-in-chief.
5. (5) Mention of any information by name is prohibited, including such items as the New Army, Territorials, etc., also names of units or individuals.
6. (6) The articles of war correspondents must be confined to topographical descriptions and generalities.
7. (7) Detailed information obtained by war correspondents can be used only when permission is given, and the time of publication will vary according to circumstances.

These regulations called forth an angry protest from the Newspaper Proprietors' Association. The War Office denied all knowledge of them and they were withdrawn. The severe restrictions on the liberty of the correspondents led to continual complaints by the Association. Notwithstanding these, no marked improvement took place until July, 1917. From that date onwards the strength of the censorship was gradually relaxed, and the army eventually set up an organization to supply correspondents with information, so that in dealing with the German advance in the spring of 1918 they were able to write with freedom. By the exercise of tact, discretion and inviolable good faith, the correspondents gradually won the confidence of the army, so that towards the end of the war officers of all ranks were keen to have them with their troops and to give them every facility permitted by official regulations. A
great victory was thus achieved and a great service rendered by the correspondents to the country and the Press.

Until Nov. 1917 the censorship was controlled by the Intelligence Department at G.H.Q. At that date it was transferred to a department known as Staff Duties. The difficulties were accentuated by the lack of association between the correspondents and the real head of the censorship at G.H.Q. The man who gave the orders did not censor the "copy," and was not in continuous and direct touch with those who did. The censors worked under great pressure, and the complaints were due chiefly not to their decisions, but to the principle laid down by those in command at G.H.Q. A minor difficulty was due to the necessity of making the despatches correspond with the official communiqué—the official account of the day's fighting. Nothing could be said by the correspondents that differed from the communiqués, which usually came out after the despatches had been written. The head of the Intelligence Department until Nov. 1917 was Gen. Charteris. During the whole of the war the chief cause of complaint was the refusal of the authorities to permit the correspondents to identify the units taking part in particular operations, or, in other words, to name the troops engaged. Where the unit was named, neither the date of the event nor the locality in which it occurred was to be specified. The regulations in this respect were meticulous. Even obituary notices were censored. In the later phases of the war the rule was occasionally relaxed, but generally speaking it held until the Armistice.

At other military fronts than France the system adopted was similar, but special difficulties occurred in regard to the despatches from Mesopotamia, which were censored at the Front, in India and at home.

The Naval Censorship.—The navy had its own censorship department at the Admiralty, under the superintendence of Sir Douglas Brownrigg. This department worked partly through the Press Bureau and partly by direct relations with the Press. Generally speaking, the policy adopted was to suppress all information concerning the doings of the navy and allied forces and in particular events of an unfavourable character. Very little information was published concerning the mercantile tonnage sunk by the enemy. There was, however, much to be said for the suppression of these figures, the publication of which would have put fresh heart into the enemy and given them valuable information as to the effect of the submarine campaign. In many instances the German submarine crews were unaware of the effect of their operations.

The Home Front.—A rigid censorship was exercised concerning the publication of information as to the production of munitions, measures of defence, bombardments, air raids, arrests, trials and executions of spies, etc.

Books, Magazines, etc.—These were subject to censorship on the same principles as newspapers. In many cases the authorities refused permission to reproduce matter which had already appeared in American and other publications, whether true or not, the contention being that publication in England would tend to confirm and increase belief in the statements made.

General Comments.—As a method of suppression the censorship was efficient, and may be regarded as having been a complete success. The vast task was well and efficiently done, but the authorities displayed little imagination, and during the first two and a half years failed to realize that the war was a conflict between nations, not armies. They did not fully appreciate that the united effort of all classes was essential to victory, and that such effort could be secured only by telling the people the facts and letting them know that the war was a matter of life or death to the nation (see Propaganda). Experience showed that in dark days the country always rose to the occasion. The authorities also failed to appreciate the necessity for telling other peoples, and in particular the Overseas Dominions and America, what Great Britain was doing. When the war commenced the War Office and the army were full of explosive and inaccurate ideas regarding the Press. Lord Wolseley had said that the special correspondent was the curse of the modern army. This spirit pervaded the services during the earlier stages of the war, notwithstanding the voluntary action of the newspapers in suppressing naval and military information in July and Aug., 1914.

Maj.-Gen. Sir C. E. Callwell, who was the head of the Intelligence Department at the War Office when the war started, says in his Experiences of a Dog-Out (1920):—"It speedily became apparent that the 'Powers-that-Be' did not mean to be expansive in connection with incidents where our side was getting the worst of it." He also acknowledges that the Press was badly treated by the War Office and G.H.Q. at the outset and that he was placed in the uncomfortable position of administering a policy which he disliked and which he believed to be entirely misdirected. In short, the Press was regarded with distrust and suspicion. These feelings were gradually removed after constant protests, but not until the war had been in progress for nearly three years was a system evolved which by degrees gave the correspondents a reasonable amount of freedom. The rule prohibiting them, except in rare cases, from describing the achievements of the different units, who were thus robbed of the glory to which they were entitled, had most unfortunate results. The public yearned to know what the soldiers and sailors were doing, and the information was withheld from them. The Australian, Canadian and New Zealand censorships adopted a different system, so that the exploits of these troops were and are well known throughout the world. This led to the circulation of malicious stories to the effect that Great Britain was not doing her share, and that she was preserving her soldiers at the expense of those furnished from overseas. A reference to the terrible weekly casualty lists would at once prove the falsity of this statement. The truth is that so far as the British effort is concerned, the main burden was borne by troops furnished from Great Britain. Owing to the action of the British censorship, this fact is still imperfectly understood in other countries. The effects of the policy of silence were not confined to the war. Great Britain suffers from them permanently. In America and elsewhere the stupendous character of the British performances and sacrifices has been inadequately appreciated because they were not made known at the time. It is doubtful whether the people in Great Britain have fully realized themselves what they accomplished. During the war the Press was engaged in a continuous battle with the departments for more information. It was rarely possible to ascertain who was responsible for the policy of silence. The motives were laudable. What the authorities lacked was vision. The Press fully understood the necessity for secrecy in regard to forthcoming naval and military movements and also in reference to many naval and military operations. But there were other matters which might have been described had the authorities recognized the necessity for giving due publicity to what the nation was doing in the war. As already explained, the policy of secrecy was not confined to naval and military operations. It was only after continued protests by the Newspaper Proprietors' Association that publicity was given to the gigantic achievements of the Ministry of Munitions, and the manufacturers and millions of workers associated with it. Nothing was published about the marvellous working of the railways, one of the most remarkable feats in history. The railwaymen were left to fight their battles alone. It was stated officially that "the Navy did not wish for publicity." The result was that the wonderful British seamens, including the mercantile marine, mine-sweepers and fishermen, did not receive adequate recognition of their services to the Allies. After continued representations by the newspapers, more publicity was given to their doings in the later stages of the war.

It must, however, be recognized that the censorship bristled with difficulties. It was necessary to prevent the enemy from receiving information; it was necessary to avoid publishing information that would unnecessarily alarm British people or their Allies, or mislead neutrals as to the progress of the war; and it was also necessary for British censors to pay due regard to the censorship policies of other countries with whom Great Britain was associated. The authorities may be excused for their inability in the early days of the war to grasp the essential facts
of the situation, but they laid themselves open to severe criticism for the delay in realizing that a change of policy was necessary.

Callow, The Experiences of a Dunk-Out (1920); Sir Douglas Brownrigg, The Indiscretions of a Naval Censor (1919). (RL)

(2) UNITED STATES.—American Federal legislation in the matter of censorship shows nothing comparable to the British and French Government censorship of newspapers. The Federal Government had no traditions of censorship except the disastrous ones in connexion with the Alien and Sedition laws of 1798. The freedom of the press rests on the Constitution and must make no law ... abridging the freedom of speech or of the press . . . ." There had been no sufficient number of cases before 1917 to afford a clear interpretation of this, except that it had been held that it was binding in war as in peace (Milligan case, 71 U.S. 2,000,000

In the first weeks after the United States had declared war, Congress rejected an amendment to the Espionage Act that would have established a censor's bureau. Recognizing that a war involving the whole nation necessitated full information, the President established a Committee on Public Information on April 14, 1917. This agency for publicity concerning war efforts and purposes developed into a great news agency and a means of distribution of patriotic propaganda. Its only direct relation to the control of the press was a request made by it in the name of the Secretaries of State, War and the Navy that newspapers censor themselves in the matter of news that might help the enemy or embarrass the Government. There was no legal force behind this. It was generally observed but with much grumbling and denunciation of the chairman of the Committee, Mr. George Creel, as a "censor.

The adherence of Congress and the President to the traditions of free press and free speech is simply requesting a voluntary censorship was striking, but it was more in appearance than in reality. It seemed exceptional, for in addition to the usual reasons which justified the other belligerents in instituting official press bureaus and censors to control seditious utterances, the United States faced conditions unknown to them. It was the domicile of about 4,000,000 unnaturalized citizens of the Central Powers—"enemy aliens," to use an old and misleading phrase that was revived. In addition there were millions more born in those lands and using their languages, who had become citizens legally. During two and a half years of neutrality, the free and acrimonious discussion of the war had been incessant in every home and community and school as well as in Congressional debates. The propaganda agencies of all the nations, and especially of the Central Powers, had flooded the mails, used the lecture platforms and organized their semi-official press. The country had heard much of the German espionage system, spies were suspected everywhere, and many acts of sabotage, arson, and violence in factories engaged in munition production were ascribed to them. The activities of German agents, some real and many imagined, seemed to call for a vigorous action. In other respects, too, the United States departed from its old individualistic tendencies, as in instituting the draft, regulating food, raising huge loans, observing meatless days and sending an army of 2,000,000 to fight in Europe. That wise and necessary restraint did not more often give way to oppression and violence is amazing in a country where the frontier had but recently disappeared.

The fact that no new agency was established to control the Press did not mean that communication, the Press and public speech were to continue to be unrestricted. On April 6 1917, the day war was declared, the radio stations were taken over by the Department of the Navy under the law of 1912. On April 28 the President placed the cables in charge of the same department and the dispatch of messages and use of codes was strictly regulated. On the latter date the telegraph lines were placed in charge of the War Department but transferred later to the Post Office Department when the Government took over the telegraph and express companies. Under the old Interment

Statute of 1798, the Attorney-General was authorized to the President to intern dangerous enemy aliens and by an Act of Congress the Alien Property Custodian assumed charge of enemy aliens' property.

So far Federal officials were acting under pre-war legislation including the old Treason law. The earliest war measures aimed at sedition and disloyalty had as a background the passage of the conscription or Selective Service law. It was a great venture in legislation for the United States. The possibility of interference with its enforcement was clearly in mind in the Espionage Act (June 15, 1917), which provided that (Section 3, title 1): "Whoever when the United States is at war, shall willfully make or cause to be made or printed or published or transmitted by any means or device any written, printed or electrostatic matter which contained or was intended to contain any false, scandalous and malicious writing or statement with intent to defame the United States, or any officer or employee thereof, or to expose any officer or employee thereof to public hatred, contempt, or disguised contempt, or to excite hatred, contempt, or disguised contempt against any officer or employee thereof, or to instigate or excite any disorderly or belligerent act oraggregate, or to incite to war, or to bring about or to procure the suspension of the operation or success of the military or naval forces of the United States or to promote the success of its enemies, and whoever when the United States is at war, shall willfully cause or attempt to cause insubordination, disloyalty, mutiny, or refusal of duty in the military or naval forces of the United States, or shall willfully obstruct the recruiting or enlistment service of the United States shall be punished by a fine of not more than $10,000 or imprisonment for not more than 20 years, or both." The last of these clauses was the one often invoked by Federal legal officers. Another section declared non-mailable all writing, prints, or printed matter which violated any provision of the Espionage Act. This Act was not amended until May 1918 by the Passport and Sabotage Acts and the so-called "Sedition Law." The latter, a loosely drawn statute based on an Act of the state of Montana, sought to suppress all utterances of a disloyal character. It provided punishments up to 20 years' imprisonment for anyone who published "any language intended to bring to the government of the United States or the Constitution into contempt, scorn, contumely and disrespect." It opened the possibility for all kinds of complaints and prosecutions by those whose judgment was affected by war hysteria. The Federal Attorney-General, his assistant and the 88 U.S. district attorneys were flooded with silly complaints and beset by unofficial disloyalty hunters and amateur detectives, but kept their heads in most cases remarkably well, as did most of the judges. In the end no prosecutions were permitted until the Attorney-General reviewed the facts and gave authorization. The meaning of this statute was not interpreted by the Supreme Court until 1919, after the fighting was over. Not till then did the courts of first instance have a uniform and controlling indication that the relation between words alleged to be criminal and the armed forces of the nation must be direct enough to constitute a "clear and present danger." Before this, state and Federal courts had taken wide latitude in considering the "general tendency" of utterances. Men had been convicted for criticizing the Red Cross, doubting the utility of knitting socks for soldiers, using abusive and intemperate language in arguments about the war or producing such a motion picture as The Spirit of '76 which in one part represented British soldiers using bayonets at the Wyoming valley massacre. The obsession that the country was full of German spies persisted until 1918, although Federal officers had broken up German espionage early in the war. The Federal Attorney-General, his assistant and the 88 U.S. district attorneys were subjected to mistreatment of the war ended. Federal legislation was supplemented by Acts of even a more drastic character, in most of the states. Many of the state Acts on sedition had date of 1910, i.e. after the close of the war and therefore the subject to application and interpretation in fields quite unrelated to the nation's safety during war. In 25 states the display of a red flag was a specified offence. The other source of complaint against Federal activity was the qualitatively unreviewable power exercised by the Postmaster-General, Mr. Burleson, in closing the mails to journals of which he disapproved. This control was most often exercised by cancelling their classification as second-class matter entitled to low mailing rates. This virtual exclusion from the mails was continued to the financial ruin of some newspapers even though the objection was based on the material in one issue. Much bitter comment (some of it
CEREBRO-SPINAL FEVER

partisan) and discontent were aroused by the action of the Postmaster-General.

So far as the foreign language press was concerned there were about 750 newspapers in the 14 chief language groups with which the Government was chiefly concerned. Most of these regularly published the official news from Washington concerning war activities and purposes. The President was empowered under the Trading with the Enemy Act (Oct. 6 1917), to require that translations of political views and comment touching the United States or any other nation engaged in the war should be filed with the post-office officials at the mailing point in the case of all foreign language publications. Exemption from this rule by special permit was allowed and freely granted. The Post Office Department was designated by executive order as responsible for enforcement of the regulations. The act a very inclusive section gave the President complete power to control any form of communication to be delivered directly or indirectly to any enemy or ally of enemy, or communications of any sort between the United States and any foreign country.

By executive order of Oct. 12 the enforcement of this was put in the hands of a Censorship Board composed of the Secretaries of War and the Navy, the Postmaster-General, the chairman of the War Trade Board and the chairman of the Committee on Public Information. This body made the necessary regulations and by Dec. 11 1917 had gathered a large staff at the necessary ports to enforce them. The regulations in no way modified the voluntary censorship exercised by the Press over itself.

About 6,000 out of 4,000,000 "alien enemies" were interned or put under restraint. In all, 1,532 persons were arrested under the Espionage Act; about 75 more for threats against the President or for sabotage. There were 905 indictments for conspiracy. Acquittals and cases pending reduced the number of those actually convicted under the Espionage Act to about 600. The best-known case was that of Eugene V. Debs, former Socialist candidate for president, who was sentenced to 10 years in a Federal prison for a speech opposing the war and denouncing war as the work of capital. Others were the suppression of the Masses, a radical monthly, the cases of Abrams, Goldstein, Kate O’Hare, Berger, Rose Pastor Stokes, and the I.W.W. cases (Haywood and 92 others).

Beyond the realm of Federal action were the state laws, drastic in some cases, and the executive orders of some zealous governors and state defense councils who saw danger in speaking foreign languages in public or over the telephone, or teaching German in the schools, or using certain textbooks. There was sometimes a lack of discrimination between the parties essentially loyal, representing agrarian or labour discontent, and those of their leaders whose purposes and sentiments were doubtful. There was also the sort of unofficial censorship, undefined by law but real, which communities exercised against those who had been pro-German or who were now less real by than their neighbours thought fitting to subscribe for loans and the Red Cross, and to observe food regulations.

On the whole, however, it is doubtful if all these legal and extra-legal activities in a nation of 100,000,000 were serious enough to justify any general condemnation of war legislation, the courts, and the nation. The quick reaction and sharp criticism of unfortunate acts and decisions indicated that free speech and free press were still basic ideals in the United States.

CEREBRO-SPINAL FEVER (see 18.130).—Although serious outbreaks of cerebro-splinal fever had occurred in Belfast in 1907, and in Glasgow and Edinburgh in 1906 and 1907, and although there was still a suspicion of a disease no longer present in Scotland in 1897, yet no considerable outbreak of the disease occurred in England or Wales until the first winter of the World War.

Cerebro-spinal fever had been made compulsorily notifiable in England in 1912, and in that year, in 1913, and in 1914, approximately 300 cases were notified in England and Wales each year.

In 1915 the disease increased more than tenfold, there being 2,342 cases and 1,136 military cases. From the first outbreak indeed assumed very menacing proportions, and in a single week 228 cases were notified. Considerable alarm was aroused as the mortality was exceedingly high, and the serum treatment which had been so successful in the New York and Belfast epidemics appeared at this time to have little effect upon the mortality rate. Special investigations were therefore commenced by the responsible authorities (especially by the army with the assistance of the Medical Research Committee), which were continued during the war, and added greatly to the knowledge of the bacteriology and epidemiology of the disease.

Diminishing somewhat in 1916 the disease broke out with fresh vigour in 1917, military and civil cases being now about equal in numbers.

Aetologically, there can be little doubt that the outbreak in England which followed the birth of the new armies was principally due to the overcrowding of young recruits in depots, camps, and billets. It is also probable, although this has been widely controverted, that fresh and highly virulent strains of the meningococcus were brought to England by the Canadian contingents arriving in the late autumn of 1914 after having served in several years in their home camps before embarkation and during the voyage east. New importations, and a sharp outbreak on arrival on Salisbury Plain several weeks before British troops were affected. These virulent Canadian strains I have gravely the outbreak.

At Portsmouth, for example, the disease began on Jan. 15 1915, at Eastney barracks among men who came in contact with a Canadian football team which visited there on Jan. 9, and the first case of the disease at Caterham depot occurred in a man who travelled up from Scotland by night with three Canadian soldiers in the same compartment.

The aetiology of cerebro-spinal fever is peculiarly instructive from the fact that, in at least 95% of all cases, the disease results not from infection derived from another patient suffering from the disease but from infection derived from an apparently healthy carrier, that is a person who harbours the meningococcus in his nasopharyngeal secretion without contracting the disease, and who is usually unaware of having ever been in contact with a patient suffering from the disease. Infection is most often transmitted in sleeping quarters.

Carriers are of two kinds: temporary carriers who harbour the meningococcus for only a few weeks or less, and then become spontaneously; and chronic carriers who harbour the germ for many months and even years.

Clemenson has shown that almost all chronic carriers have marked nasal coughs, and that in the vast majority of cases there is an obstinate mucous contact between a deflected and thickened nasal septum and the middle turbinate.

Chronic carriers are responsible for carrying on the disease from epidemic to epidemic and also for the sporadic cases which occur between epidemic periods. Recovered patients are often chronic carriers, the meningococcus having been recovered after two years from the nasopharyngeal secretion in several instances.

In ordinary times the population probably contains some 2% of carriers, but at the height of an epidemic in a crowded community, such as that on a ship or in a crowded depot, the carrier-rate may rise to 5%, the vast majority of the carriers being temporary.

At the outbreak of war the necessity for rapidly raising enormous forces at once led to very serious overcrowding of the available barracks and depots, and the hastily erected camps and hutsments were overcrowded as soon as they were occupied. Every necessary was urgent and imperative.

In Jan. 1915, all the known requisite factors for an outbreak of cerebro-spinal fever were present: severe overcrowding, cold weather, and already-seeded mucous carriers, and it appears that the lick of rapid training, by nostalgia, and by entry into a new method of life. Recruits have always shared with infants a peculiar susceptibility to cerebro-spinal fever. The armies in the field admitted that hardship suffered much less than the recruits training at home. The incidence of cerebro-spinal fever in the U.S. training camps following their entry into the war was 35 times as great as that in corresponding male age groups in civil life.

Overcrowding has at least a threefold importance as a factor in the production of cerebro-spinal fever epidemics:

First, the atmosphere of an overcrowded and ill-ventilated room or hut, by lowering the individual resistance, tends to favour the
CEREBRO-SPINAL FEVER

597

chances of the meningococcus attacking the meninges with success. Secondly, by shortening the distance between man and man, overcrowding and close contact increase the incidence of respiratory passages, since these are present in droplets of secretion which are liable to be sprayed out into the surrounding air, in the acts of coughing, sneezing and loud speaking. For this reason, overcrowding has always been associated with epidemics of miliary diseases, which so frequently precede and accompany an outbreak of cerebro-spinal fever. Thirdly, for a similar reason, overcrowding tends to produce a higher concentration of meningococcal meningitis, and thus allowing to any susceptible individual, freshly introduced, a massive dosage of the organism.

In addition, the rapid transmission from one temporary carrier to another carrier of a higher type of meningococcus, which is about as much more potent and therefore more dangerous to a susceptible individual, greatly tends to increase the virulence of a strain of meningococcus previously of low virulence.

Glover's work on carrier-rates demonstrated that the meningococcus is a direct index of the degree of overcrowding, and that, when this overcrowding is remedied by increasing the distance between the beds, a high carrier-rate rapidly falls to a normal rate. There is a sharp rise in the carrier-rate of a community before an epidemic, that is to say, a "carrier epidemic" precedes and accompanies the "case epidemic." For practical purposes, a carrier-rate of 20% has been regarded as the danger line.

Cerebro-spinal fever is an acute infectious disease, due to the meningococcus. It occurs sporadically and in epidemics, and has usually as its chief manifestation an acute meningitis affecting both brain and spinal cord. The causal organism is undoubtedly the diplococcus intracellularis of Welchelbaum, a gram-negative coccus, and is thus the diagnostic diplococcus in pairs, and having no well-defined capsule. In the body fluids, and especially in the cerebro-spinal fluid, it is usually seen inside a polymorphonuclear white corpuscle. Often, however, the diplococcus is seen to be extracellular. Prognosis in a case is usually considered to be better when a slide of the cerebro-spinal fluid shows the majority of the diplococci intracellular rather than extracellular.

The meningococcus stains well, and is invariably gram-negative. An excellent culture medium is that of Difco's agar enriched for equilibrium, and consisting of maltose, peptone, beef extract, and a little raffinose or dried milk. The optimum temperature is 37°C. The meningococcus ferments glucose and maltose, but not levulose or saccharose. While it may be distinguished from other gram-negative diplococci by certain cultural tests, the best criterion for identification is serological, that is by agglutination tests with the sera of animals, immunized by repeated injections of killed meningococci obtained by culture from the cerebro-spinal fluid of patients suffering from the disease.

By the use of this method of agglutination and the allied method of absorption, Gordon divided the meningococci found in military cases of the disease in 1915 into four types. Dopter had previously divided the meningococci into two types, 1 and 2. The serious cases were composed of a mixture of patients' own meningococci, and the first two types of Gordon, which together account for 85% of the cases, correspond to Dopter's types 1 and 2. Gordon's type 1 may be termed a "treatment" meningococcus, and type 2 Dopter's parameningococcus. Gordon's type 3, which is more closely allied to type 1 than to type 2, gave rise to some 15% of the cases, whilst Gordon's type 4 was of rare occurrence except in patients suffering from meningococcal meningitis.

A patient suffering from cerebro-spinal fever harbours only a single type of meningococcus in his cerebro-spinal fluid and it is almost invariably present in his nasopharyngeal secretion.

Determination of the type of the invading meningococcus is of great practical importance, as the serum of an animal immunized against one type has little or no therapeutic or protective value in a patient suffering from an invasion of a different type of meningococcus. It may even be proved fatal, and if monovalent, be used only for its appropriate type when the type has been determined. For general use a polyvalent serum has the advantage of a wider specific activity and with potent serum the results are extraordinarily good.

Tullock has shown that type 2 is a complex type divisible into three sub-groups, and the much greater difficulty in producing a successful and lasting immunity, to this type, as compared with the other types, is due to this fact.

Criticism of Gordon's types has concentrated mainly on his types 3 and 4, but there can be no doubt that Gordon's types were of the utmost value for the epidemic of 1915-8. In a series of 528 strains of meningococcus from 41 epidemic sources, 391 were clearly identifiable with one or other of the four types, and one-fifth belonged to types 3 and 4.

It is important to remember that the nasopharynx probably always takes place first. In most cases a blood infection appears to precede the meningeval invasion, but the actual channel of infection between the nasopharyngeal secretion and the meninges is uncertain; it may be either through the blood stream, or by the shafts of the olfactory nerves passing through the cribriform portion of the ethmoid, or by the sphenoidal sinuses.

The incubation period is usually three to four days. The onset is sudden and contrasts with the usually more gradual onset of tuberculous meningitis. The case is a very acute type of illness and of great importance. Intense headache, vomiting, a moderate degree of pyrexia with a comparatively slow pulse, stiffness of the muscles of the neck and a positive Kernig's sign are the primary symptoms. The inhalation of meningococci is usually being all present in 85% of cases, and only some 10% of cases are atypical, the most common deviation being a long initial pyrexia.

If meningococcal meningitis is present any suspicious cerebro-spinal fluid should be performed at the earliest possible opportunity for the purposes of both diagnosis and treatment. Retraction of the head is a later symptom and should never be waited for.

The rash is present in a percentage of cases, which varies considerably in different epidemics. Rashes appear more constant in American experience. In 1917 in London it was present in about 25% of cases. A typical and rare rash appearing in the skin and the dorsum of the foot, then spreading to the elbows, buttocks and back. Large purpuric patches are characteristic of fulminating cases, which form about 5% of the cases. Petechial maculae, erythema, rose spots, and blotches often occur in cases of ordinary severity.

Lialb herpes is a later symptom than the rashes, and is of favourable import. Inequality of the pupils is less common than in tuber- culous meningitis. Hemiplegia, usually transient, and nerve deafness, usually permanent, each occur in about 5% of cases. Albinumuria is common, but usually transient; haemoglobinuria is rare. Constipation is almost invariable and with the incessant vomiting may lead to the diagnosis of an acute abdominal condition.

Retraction occurs at an earlier stage than in adults. Persistent tetany of hands and feet is common and rapid emaciation occurs.

These three main clinical types of the disease are described, fulminating, septic type, and 2nd type. In each case is described in terms of the systemic invasion results in so profound a toxemia that the death or early collapse of the patient may obscure the meningeval condition. Death may take place in a few hours after onset. Fulminating cases are common to some extent in all epidemics, and are frequently the cause of an epidemic. Typical severe cases form some 85% of all cases and in them cerebro-spinal fever forms as clear a clinical feature as does any disease. Adults more commonly suffer from a second type of a long preliminary pyrexia which may be diagnosed as enteric or trench fever. Ambulant or slight attacks do not occur.

The essentials of the treatment of cerebro-spinal fever are three--

First, early and repeated relief of pressure by lumbar puncture; this procedure alone will considerably reduce the case mortality rate in adults. Secondly, the early and repeated intrathecal administration of a potent antimeningococcal serum (intravenous administration may also be beneficial if the systemic invasion be marked). Thirdly, the relief of pain.

Serum treatment depends for its success upon early administration, upon sufficient dosage and upon the therapeutic potency of the serum. Serum has been made available in commercial quantities by the researches of Flexner and Jobling in the New York epidemic of 1905 with great success, and reduced the "untreated" case death-rate of 75% to the "treated" case death-rate of 40% in patients who received serum in the first week of illness.

Unfortunately, at the beginning of the 1915 epidemic in England the only serum available proved very disappointing. It had been obtained from laboratory animals and proved a very little therapeutic effect. Subsequently it was found to fail to agglutinate types 1 and 2 at a dilution of 1 in 50. Following the collection of fresh strains from the current epidemic by Arkwright, Gordon, and others, however, a very potent serum was produced from them by McConkey at the Lister Institute in 1916, which again fully vindicated the value of serum treatment, reducing the mortality rate in cases to 15% used from the first week to 14%.

It is shown that the therapeutic value of serum treatment depends chiefly upon its capacity of neutralizing the toxins of the meningococcus. There is great variation in therapeutic value even in serum produced from cultures of a given meningococcus, and a modification of Besredka's method for determining anti-endotoxic content promises well as a method whereby a standardization of anti-meningococcal serum could be reached.

Lumbar puncture, preferably under an anaesthetic, should be done as early as practicable. It is not usually done until about 60 c.c., as will flow should be allowed to run from the needle into sterilized test tubes for culture and examination, until the fluid comes one drop at a time with each respiration. If the cerebro-spinal fluid be cloudy or purulent, 30 c.c. of serum must be given to blood-heat is then run in through the needle by gravitation with a rubber tube. The foot of the bed is raised after administration.
This procedure is repeated at intervals of 24 hours until four doses have been given, which are usually given with a period of 3 to 4 days between doses. The initial dose of fluid becomes clear and free from meningococcus. Often two or three doses are sufficient. It is often wise to conclude the series with a lumbar puncture without the use of serum for the relief of pressure of meningococcus. Curative vaccines have been used in prolonged cases, where serum appears to be losing its effect. An autogenous sensitized vaccine should be used.

Another method of treatment used in cases where the patient does not respond to curative herpes in any form, or where no curative serum is available, is to inject intrathecally 30 to 50 c.c. of the patient's own serum, separated under strict aseptic conditions from blood drawn from his basilic vein. This is done upon the theory that anti-bodies are developed in greater extent in the brain than in the cerebro-spinal fluid, and in some instances appears to do much good.

The eighth to the tenth day is often observed, but is not usually serious. Anaphylaxis is very occasionally seen. It is more liable to occur with intravascular than with intrathecal injection.

The principal complications met with are pneumonia, the supravention of a pneumatocoele meningitis; arthritis, and cystitis due to the meningococcus, hydrocephalus, panophthalmitis.

In patients who recover, complete nerve deafness is the most common (3 to 5%) of the serious sequelae. Permanent mental change is unusual. A prolonged convalescence is essential.

The chief post-mortem findings in the majority of fatal cases are confined to the central and nervous system. Their macroscopic appearances are found in cases of other forms of meningitis. Fulminating cases may show little save injection of the dura mater, a lustreless arachnoid, a soft and swollen appearance of the brain together with a pink congestion of the pia mater. The cerebro-spinal fluid is turbid, and may contain exudate. Flaky and turbid fluid is found in the distended ventricles.

In chronic cases there is marked hydrocephalus. The convolutions are pale and flattened; localized adhesions and the formation of laminated pockets in the cranium and theca. The various foramina, particularly that of Majendie, may be obliterated, interfering with the circulation of the cerebro-spinal fluid. Marked thickening of the tela.

The post-mortem appearances in other organs are not usually striking. Embleton has shown the frequency of empyema of the saphenous sinus. A broncho-pneumonia is almost invariable. Purpura is found in other organs in common in many organs, and have been especially described by some observers in the suprarenal capsules in fulminating cases. Arthritis, orchitis, and pericarditis are described and a meningocoeal meningitis may be found.

The chief point in the prophylaxis against cerebro-spinal fever is, of course, the prevention of overcrowding; this is of paramount importance. Ventilation and distance between the beds in sleeping quarters of much greater importance than mere floor or cubic space. "Wall space" is essential.

The early isolation of cases of catarrhal disease is of great importance in preventing the increase in the carrier-rate for the reason that a case may act as a source of catarrhal spray, which catarrhal pro-
coccus in a much more effective manner than the same carrier without a catarrh. As a rule the meningococcus itself does not give rise to catarrhal symptoms in the carrier.

Washing the nose is unavoidable and space-out impracticable, steam spray treatment, using a 2% solution of zinc sulphate, may be given for 10 minutes daily to the overcrowded community. In several instances this procedure appeared to check the incidence of cases between actual outbreaks of cerebro-spinal fever. This method of treatment should, however, never be used as a substitute for spacing-out and improved ventilation.

Prophylactic vaccination cannot be regarded as having been proved to afford protection, though at Salisbury and at Camp Funston it appeared to give promising results. (J. A. G.)

CEYLON (see § 738).—The pop. had increased from 3,578,333 in 1901 to 4,110,572 in 1911 and was estimated at 4,787,598 on Dec. 31, 1919, giving a density of 187 per sq. mile. The proportions according to race, per 1,000 of the total pop., were:—Europeans 1,5; Burghers 6-2, Sinhalese 628-3, Tamils 904, Moors 58-2, Malays 3, others 34-9. European residents numbered 7,334 in 1919. The death-rate was 35-6 per 1,000 in 1916—the highest yet recorded—and was mainly attributable to the influenza epidemic and an outbreak of cholera. The urban pop. represented about 15% of the total, the chief towns being: Colombo, pop. (1911) 211,274, Jaffna 40,444, Galle 30,060 and Kandy 24,451. Both immigration and emigration figures showed a general decrease—from 120,354 and 90,374 respectively in 1911 to 47,260 and 35,119 in 1917.

It is estimated that 2,182 Ceylon men (Europeans 1,573, and Sinhalese 609) joined the army during the World War and a further 1,204 were recruited for service as clerks and mechanics.

The Ceylon Sanitary Company, raised in 1917, rendered conspicuously valuable service in Mesopotamia. The Letters Patent embodied in the Letters Patent of 1919, Ceylon was administered by a governor aided by an executive council of seven members, including the officer commanding, the colonial secretary, attorney-general, controller of revenue, colonial treasurer, Government agent of the western province, and one member nominated by the governor; and a Legislative Council of 21, including the 7 members of the executive, 4 other official, and 10 unofficial members, of whom 6 were nominees of the governor and 4 elected to represent separate communities.

On Oct. 1, 1920, with a view to giving a larger measure of popular control over administration, changes in the constitution which had been for some time under consideration received the approval of the King. The provisions were as follows:—

As regards the executive council, the governor is instructed to appoint an additional three unofficial members; and, as to the Legislative Council, the modifications will (i) involve a considerable extension of the Franchise and elect four additional members, (ii) give the unofficial members a substantial majority over the official vote.

The reformed Legislative Council will number 37 members (exclusive of the governor who will preside), viz. 14 official and 23 unofficial. As each of the 14 official members will represent the European community, and the 23 unofficial members the Burgher community, one of the Chamber of Commerce, one the Low Country Products Association, and (until the registers for the Kandy and Indian communities can be undertaken) two members will be nominated to represent these communities. Of the remaining four members, one member will be nominated (as before) to represent the Mohammedan community—it being thought impossible to obtain sufficient or Mohammadians in the island to introduce an any system of election for this community—and the governor will have power to appoint not more than three unofficial members to represent interests inadequately provided for.

By this arrangement, the unofficial members of the Legislative Council will be in a majority of nine over the official, but the governor will have both an original and a casting vote if he should choose to exercise it, and, in order to prevent a deadlock, it is provided that he may declare the passing of any measure to be of paramount importance to the public interest and, in such case, the measure may be carried by the votes of the official members. Somewhat similar reserve powers are contained in the Government of India Act.

The reforms have been opposed by certain sections and, in Oct. 1920, the Ceylon National Congress unanimously resolved to boycott the Legislative Council until it had been dissolved before being confirmed by the governor in executive council. The board consists of not less than 16, or more than 20, members nominated by the governor, of whom the director and assistant director are ex officio members while the others hold office for three years.

In 1919 there were 884 Government vernacular schools, with an attendance of 97,819 boys and 32,570 girls; 1,885 Government aided schools, with 129,027 boys and 78,642 girls; 256 aided estate schools, with 925 boys and 247 girls; 295 English and Anglo-vernacular schools attended by 36,526 boys and 10,462 girls—a total of just under 400,000. The total sum expended by Government on vernacular education in 1919 was Rs. 1,1,264,000, of which approximately two-fifths were spent on Government and three-fifths on aided schools. The total number of pupils attending secondary schools was 8,065 in 1919. The Government training college (1919) had 39 men and 41 women in training; 36 men and 42 women in the Anglo-vernacular, and 40 men and 40 women in the Sinhalese.

A scheme was on foot in 1919 for affiliating Ceylon University College to Oxford University. The building of a new Royal College was begun in 1920.
Police.—The strength of the force on Dec. 31 1919 was 2,884 of all ranks. Statistics show an apparent increase of crime: there were 7,581 convictions in 1917, 8,328 in 1918, and 8,577 in 1919, the larger proportions of which were for breaches of the peace.

Revenue and Expenditure during the five years 1915–9—the financial year ending Sept. 30—were as follows:—

<table>
<thead>
<tr>
<th>Year</th>
<th>Revenue (Rs.)</th>
<th>Expenditure (Rs.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1915</td>
<td>51,545,475</td>

</tbody>
</table>

The principal sources of revenue in 1918 were: customs, Rs. 19,857,235; railways, 16,702,050; spirit licenses, 8,991,795; stamps, 7,523,981; port and harbour dues, 2,218,155; the salt monopoly, 606,000; and government lands. From such expenditure: railways, Rs. 12,246,895; public works, 8,218,935; interest and sinking fund on loans, 5,394,485; military, 4,668,660; medical department, 4,061,430; post and telegraph, 2,879,450; education, 2,456,050. The area of crops sold decreased from 32,832 ac. in 1913, to 6,019 ac. in 1918, but rose to 6,456 ac. in 1919 which in the year of outbreak sold, instead of leasing in perpetuity, was reverted to.

Public Debt—At the close of the financial year 1919, the public debt stood at £1,124,268, or approximately one and one-tenth times the annual revenue.

Currency.—The value of currency notes in circulation was Rs. 40,333,042. The Ceylon Savings Bank had a sum of Rs. 4,080,722 to the credit of 39,769 depositors on Dec. 31 1919, as against Rs. 5,132,980 and 37,099 depositors in 1911.

Other Industries.—Sub-committees were engaged in 1910 in investigating the possibility of establishing paper and glass manufactures for which the raw materials are available in great quantity; and the development of the fisheries (the present primitive state) was still being studied in 1921. The Public Works Department continued to investigate the question of hydro-electric production for the supply of electricity to industries and railways.

Trading.—The total length of railways was 728 in 1919, as against 712 in the previous year. The extension of the main up-country line by 21 m. to Badulla, the principal centre of the Uva province, was undertaken in 1917. The total length of roads was 4,086 m. of which 267 m. were mere bridle-tracks. At the end of 1919, there were 550 post-offices (including 160 telegraph) as compared with 441 in 1911.

The table that follows gives the round numbers in the export of rubber and tea during the period 1910–9:

The staple exports (values in lakhs of rupees) in 1919 were: rubber, 1,321, tea, 1,165, copra, 323, coconut oil, 273, desiccated coconut, 259, and cinnamon, 37. Of exports in 1919 the United Kingdom took 42%: United States 13%, British 6% and of imports British India sent 30.4%: Burma 33% and United Kingdom 14.3.

The following table gives in round numbers the exports of rubber and tea during the period 1910–9:

Shipping.—During 1919, 4,130 vessels (including 1,015 sailing craft) with a total tonnage of 9,988,810 (tonnage of 224,000 for sailing craft 102,230) entered the several ports. The distribution according to nationality was: British, 6,167,584 tons; Japanese, 1,084,318; Dutch, 1,777,767. United States, 87,499. The total coastings amounted to 6,863,443.

CHAFFEE, ADNA ROMANZA (1842–1914), American soldier (see 5,800), died in Los Angeles, Cal., Nov. 17 1914.

CHAMBERLAIN, JOSEPH (1836–1914), British statesman, was born at Highbury, Birmingham, July 2 1914. From 1910 onwards, as for the three or four years previously, after he had been struck down by illness in 1906, Mr. Chamberlain remained in the political background, personally crippled, but intellectually an abiding source of strength to his old political followers, who continued to cherish his inspiration and to work for his ideals in the development of a united British Empire. Since they were now in opposition, the cause of tariff reform and imperial preference was no longer one of practical politics, and after the outbreak of the World War the conditions which had produced this active movement in 1903 were substantially altered. Nevertheless, it fell to Mr. Chamberlain's son, Austen Chamberlain, as Chancellor of the Exchequer in 1916, after his father's death, to include imperial preference in the budget of that year, and thus to carry this part of his programme to victory.

In 1916 Mr. Chamberlain's widow married Canon W. H. Carnegie, rector of St. Margaret's, Westminster, and chaplain to the House of Commons.

CHAMBERLAIN, (Joseph) AUSTEN (1863– ), English statesman, eldest son of Joseph Chamberlain (see 5,817) by his first wife, Harriet Kenrick, was born at Birmingham on Oct. 10 1863. He proceeded from school at Rugby to Trinity College, Cambridge, his father having determined to secure for the eldest son, whom he destined for politics, those academic advantages which early entrance on a business career had denied to himself when a young man. After a good degree at Cambridge and a useful apprenticeship in speaking at the Union, Austen Chamberlain completed his studies at the École des Sciences in Paris, and at the university in Berlin, where he attended the lectures of Treitschke. But valuable as this training was for the profession of politics, it was secondary to the advantages of daily contact with living issues which he enjoyed by growing up beneath the roof of perhaps the most compelling political personality of the day.

He entered the House of Commons at a by-election in E. Worcester in 1892. He was returned again at the General Election in July, and in the following year, as junior Liberal Unionist Whip, he was to witness the slow slaughter of the Second Home Rule Bill after nearly 90 days' debate, in which Joseph Chamberlain was the protagonist. When Joseph Chamberlain became in 1895 Colonial Secretary under Lord Salisbury, his son became Civil Lord of the Admiralty. For five years, until 1900, Austen Chamberlain held this office, with Lord Goschen as First Lord; and although it was not called upon to speak often in the House, he succeeded in impressing his chief, and the permanent officials, with the integrity of his character and his solid grasp of mind. Wearing a single eye-glass like his father, which his distinguished appearance (ardent, critical, and often looking as if he were doing an affine resemblance) but. "Joe's" genius was his own; and Austen's strong gifts came to be recognized as none the less remarkable because they pleased to differ widely from his father's. The S. African War was virtually over when in Oct. 1900 the "Khai" General Election took place; and upon Lord Salisbury's return to power Austen Chamberlain became Financial Secretary to the Treasury, with Hicks-Bech as Chancellor of the Exchequer. War finance explained the increased burdens of that year, and the 2d. rise in the Income Tax of the budget of 1901. But the most significant financial change appeared in the budget of 1902, when the 2d. duty upon imported corn was revived.

In the following summer Lord Salisbury resigned, and in the reconstruction following Mr. Balfour's accession to the post of Prime Minister, Austen Chamberlain entered the Cabinet for the first time as Postmaster-General. Peace in S. Africa had been declared; a season of reconstruction had now set in; and Joseph Chamberlain took advantage of the lull to visit the S. African colonies, so recently won and secured. It was on his return in 1903, only to find that a majority of the Cabinet had converted in his absence to a remission of the tax on corn, which had been destined by him and his son as a weapon, however elementary, for forcing Imperial unity—before reducing it upon its followers in the Dominions overseas—that the Tariff Reform movement was intiated by Joseph Chamberlain, with the result that in Sept., after launching the Tariff Reform League in the summer, he resigned from the Government. His son, however, joined the Cabinet as Chancellor of the Exchequer, technically a higher office than his father had ever held.
Although the Tariff Reform controversy raged throughout 1904, only faint fiscal ripples disturbed the new Chancellor's budgets of 1904 and 1905, which remained mainly orthodox. But the split in the Government and the party upon this paramount issue, together with other political causes (see 3.254), led to their crushing defeat in the election of Jan. 1906. Austen Chamberlain was again returned to Parliament. Subsequently in this year he married Ivy Dundas, by whom he had a family of two sons and one daughter. The Unionists had dwindled to 158, against 212 Ministerialists under Campbell-Bannerman, in the new Parliament, and the task of this disheartened residue was formidable. Austen Chamberlain, however, encouraged them, not only by his industrious activity, especially among the younger Tariff Reformers, in assisting the propaganda work, but in the House of Commons by his spirited assault upon the budget of 1906, as well as by his bold denunciation of Mr. Asquith's high taxation in the budget of 1907. In the year following, Mr. Asquith succeeded Campbell-Bannerman as Prime Minister, and his introduction of old-age pensions somewhat disarmed the critics of his finance. In 1906, however, Austen Chamberlain led the opposition against Mr. Lloyd George's "People's Budget." In a brilliant impromptu speech he moved its rejection, arguing that the Government was welding a weapon for oppressive taxation; and for 40 days in committee he fought it clause by clause and line by line, until the proposed diversion of the old Sinking Fund was dropped, the duty on ungotminerals had to be jettisoned, and the land taxes were whittled down into weapons of such weak revenue-raising capacity that they finally vanished (with Mr. Lloyd George's assent) in his own budgets of 1910 and 1912. In the period of constitutional crisis which followed the Lords' rejection of the budget, and after the breakdown of his father's health, he consolidated his own position in the Unionist party as the leader of the Tariff Reform movement in his father's absence; and when Mr. Baldwin resigned the leadership of the Unionist party in 1911 he had established strong claims to the succession. But another section favoured Mr. Walter Long, his senior, and it was characteristic of both men that they would not put the party to any division in the matter. Austen Chamberlain gave his full loyalty to Mr. Bonar Law when he was unanimously adopted.

In 1913 he became chairman of the Royal Commission on Indian finance and currency, acting until March 1914. When the World War broke out, it had become evident that the Coalition Government became necessary, and he then joined the Government as Secretary of State for India. In this capacity he inherited extensive military commitments in India and the conduct of a campaign in Mesopotamia, over which distance gave him spasmodic and scant control. When difficulties overcame the expedition in its advance upon Bagdad, a commission was appointed to inquire into the causes in Aug. 1916. It reported in June 1917, and, since it reflected upon the medical preparations in India, a debate followed in the House on July 11. To the general astonishment Mr. Chamberlain in his speech announced his resignation, admitting the truth of the breakdown of the hospital arrangements, but exculpating that he was entirely ignorant of it until the damage had occurred. Although the Prime Minister urged him to remain, he insisted upon the constitutional duty of a responsible minister to resign when his office had been censured, and in doing so he confirmed his reputation for disinterested and high-minded independence.

In 1918 he returned to office in Mr. Lloyd George's Coalition Government, as minister without portfolio. At the general election in Dec. he was returned unopposed for W. Birmingham, for which, on his father's death in 1914, he had been returned at a by-election, and he was then appointed, at Mr. Lloyd George's invitation, once more Chancellor of the Exchequer. The Peace was being negotiated in the early months of 1919 in Paris, but Mr. Chamberlain's valuable contribution to the deliberations thereof on the Supreme Economic Council, over which he presided, did not prevent the introduction by him of the budget on the last day of April, in a speech reflecting the gigantic pecuniary sacrifices of the nation and the urgent need for economy. Taxation was increased to meet an expected deficit; but the distinctive departure of the budget was the reduction of existing duties by one-sixth upon articles of general consumption from the Colonies. The principle of Imperial Preference thereby became an integral element of the British financial system; and by a strange stroke of fate it was thus first introduced by the son of the statesman who had sacrificed everything to preach this principle and convert his countrymen 15 years before. A little later in the year, although private pockets were empty and the spirit of sacrifice temporarily exhausted, Mr. Chamberlain issued the Victory Loan. In the budget of 1920 he had the titanic task of attempting to make revenue and expenditure balance, with a deadweight debt of £2,835,000,000 and a floating debt of £3,312,000,000. But not content with £50,000,000 in hand for debt reduction, Mr. Chamberlain called upon the nation for further efforts and increased the excess profits duty to 60%, while introducing a corporation tax for the first time. When he had taken office as Chancellor late in 1918 the budget could not be balanced without borrowing, and currency inflation continued. But in this, his second year, the budget balanced, over £250,000,000 of debt was repaid out of revenue, and inflation took a downward turn. On the other hand trade prospects were favourable, and before it could be realized that wide economic dislocation on the Continent, aggravated by home labour disputes, was about to create a profound commercial depression. Criticism was, however, not wanting in later months that a less drastic policy of debt reduction would have left citizens better able to finance business, and as the year went on some concessions had to be made to this view, with which was combined a growing agitation for economy so as to reduce expenditure. The withdrawal of the excess profits duty next year was announced in Nov. in advance of the budget statement for 1921, and Treasury control was everywhere tightened.

On March 17 1921 the political world was startled by Mr. Bonar Law's resignation of the Unionist leadership, owing to ill-health. Instinctively the party turned for a successor to the man who might have led them 10 years previously, and whose accumulated experience and services were now his overwhelming credentials. There were no competitors to Mr. Chamberlain's candidature; even the usual lobbying seemed absent; and on March 21, in a packed party gathering at the Carlton Club, he was unanimously chosen Leader of the party. As such he became Leader of the House of Commons, and took office as Secretary of State for Overseas Trade, succeeded as Chancellor of the Exchequer by Sir Robert Horne.

CHAMBERLIN, JOSHUA LAWRENCE (1828-1914), American soldier (see 5.816), died at Brunswick, Me., Feb. 24 1914.

CHAMBERS, CHARLES ADDISON (1860-1921), British playwright, was born of Irish parents at Stanmore, near Sydney, N.S.W., April 22 1860. As a boy of 15 he entered the N.S.W. civil service, but two years later sought a more adventurous life as a stock-rider in the Australian bush. In 1880 he first visited England, and two years later established himself there as a journalist, writer of stories, and finally as a playwright. Amongst his best successive plays (see 8.524, 526) may be mentioned Captain Swift (1888); The Idler (1890); John-a-Dreams (1894); The Tyranny of Tears (1899); The Awakening (1901) and Passers-By (1911). He died in London March 28 1921.

CHAMPAGNE, BATTLES IN, 1914-8.—At the end of the fighting after the battle of the Marne, the lines became stable along a front selected by neither of the opposing forces. On the sector W. of the Chemin des Dames, along the heights of Vaux-Chavonne-Soubir-Moussy, the 60th French Div. had relieved British divisions, and its front line was, so to speak, hanging on to the slopes which dominate the Aisne, with the river in its rear, and with all its communications under observation of the Germans, who were holding the fort of Condé.

I. COMBATS OF 1914-5 ON THE SOISSONS-REIMS FRONT

Vaux-Soubir, Oct. 30—Nov. 2 1914.—On Oct. 29 the trenches occupied by the French 60th Reserve Div. were strongly bombarded on the plateau of Rouge-Maison; on Oct. 30 the 153th
Brigade was attacked with great violence; on account of the extent of its front it had no reserves and was compelled to retreat at 9 a.m. on the bridges of Vally and Chavonne and to consolidate S. of the Aisne. On Nov. 1 the German patrols, which had pushed forward on the left bank, were driven off. On Nov. 2, however, at 8 a.m., after a violent bombardment the 138th Brigade was attacked in its turn andced one to two km. of ground, stopping the enemy advance in front of Soupir and Moussey. The 69th Reserve Div. suffered heavy losses: 78 officers and 3,500 men.

This division was relieved by the I. Deligny Corps, which, during Nov. 6-12, failed to retake the lost ground.

The Engagement of Crouy.—On the heights of Soissons—Missy-sur-Aisne the French position was rushed forward too far to the N. of the Aisne. The 5th group of reserve divisions, which occupied this position, had even been compelled to leave the greater part of its artillery on the south bank, whence it was unable to support the infantry effectively. Fearing a repetition of the defeat suffered at Vally by the 69th Reserve Div., Gen. Maunoury, commanding the VI. Army, decided to improve his position—a position which only hung on to the edges of the plateau which overlooked the Aisne. On his instructions Gen. Berthelot, who had just taken over command of the 5th group of reserve divisions, on Dec. 7, worked out a plan of attack on the Plateau 132, which dominates Crouy, with the object of debouching later on towards Terny with his left, then towards Pont Rouge with his right.

The attack on Hill 132 was launched on Jan. 8 1915 at 8:45 a.m., after a bombardment which lasted an hour and a-half. It was supported by artillery of various calibre, in which slow-firing guns of old type preponderated: 60 guns of 75 mm., 24 of 95 mm., 4 of 105 mm., 8 of 120 mm., 10 of 155 mm. (short), 4 of 155 mm. (long). This concentration represented a great effort at that period of the war, but it was insufficient, more especially as the French attack ended in a German attack, and the battle extended over a front of 10 km. Out of six breaches which the engineers were to have made in the wire with battens filled with pe-tards four only were passable, but the others were opened by the attackers themselves. The four attacking battalions, drawn up in ten columns, seized the German trenches in a few minutes without great loss. All the German counter-attacks, preceded by violent bombardments, were repulsed during the two days of Jan. 8 and 9. On the 10th the French attack made further progress, but on the 11th the Germans succeeded in regaining a footing to the N. of Crouy.

On the night of Jan. 11-12 a flood on the Aisne swept away all the bridges at Villeneuve and at Soissons, except the “bridge of the English” at Soissons, so named because it had been constructed by the British army after the battle of the Marne. This unforeseen occurrence greatly hindered the sending-up of reinforcements and rations. The Germans had received considerable reinforcements in infantry and artillery. On Jan. 12, after a violent cannonade, they attacked Hill 132 and took all the ground gained during the preceding days. Gen. Maunoury put at Gen. Berthelot’s disposal the whole of the 14th Clas Div., one brigade of which was commanded by Gen. Nivelle. He wished to hold fast on his right with the 55th Div. and the composite Klein brigade whilst the 14th Div. should attack on the left towards Terny. But on the 13th his right was strongly attacked in the direction of Montal and Ste. Marguerite; these troops were very exhausted after six days of hard fighting without rest, day or night. Moreover, the 14th Div. had only made very small progress. The German artillery with direct observation could not again place its heavy guns on the Aisne, and disaster might follow its destruction. In these circumstances to leave French troops on the right bank of the Aisne was no more than a useless act of imprudence, and Gen. Maunoury gave them the order to retreat to the left bank. That retreat was carried out in good order during the night of Jan. 13-14, without being disturbed by the enemy. The losses totalled 161 officers and 12,250 men killed, wounded or missing.

On Jan. 25-26, after a very violent bombardment, which extended over several kilometres of front, the XVIII. French Corps attempted a local attack, which, in consequence of the collapse of a dug-out which buried several hundred men, lost the crest of Hortebise on the Chemin des Dames. Then the positions became fixed on this part of the front until the French offensive of April 16 1917.

(C. M. E. M.)

II. THE WINTER BATTLE OF 1914-5

The part of Champagne in which the winter fighting of 1914 took place consists of a vast, gently undulating plain between two ridges of hills and plateaux which form its northern and southern boundaries. The greater part of its surface is formed of white chalk covered by a crust of arable soil, often very thin and in some places non-existent. This chalky plain is in its southern part known as “dusty” Champagne, and in its northern part as upper Champagne. To the E. of it lies the hilly upland country bordering the Argonne, a clayey, broken district, covered with woods and well watered. Towards the N. the central plain is broken up by a series of small isolated hills, the principal of which are the hills of Brimont (170 metres), Berri and Nogent l’Abbesse to the N. and E. of Reims and of Moronvilliers (260 metres) further to the E. To the E. the Champagne plain rises in like manner to the hilly zone of Rémois and Tardenois. Ever since the beginning of the 19th century attempts had been made to improve this impoverished land by planting pines in geometrically formed clumps, which form a prominent feature of the landscape. After some 25 to 30 years at least the pine needles decompose into a kind of crust, and it is thus possible to cultivate with some prospect of success. To the N. of the Marne the Champagne plain is traversed by several streams; the Vesle running north-westwards from Somme-Vesle to the E. of Châlons; the Suisse practically parallel to it running from Somme-Suisse to the Aisne near Condé en Suisse; the Ourthe flowing in the opposite direction and N.E. of Somme-Tourbe towards the Aisne at Servon; and the Dormois passing by Ripont, Royv and Cernay en Dormois in the same direction. The Py and the Allin flow respectively to the W. and to the N.E. between Breer, the Aisne and St. Martin l’Heureux on the Suisse. Several old Roman roads cross this region, notably those from Châlons to Rethel by way of Souain and Somme-Py from St. Menchoud to Vouziers along the valley of the Aisne, all running in a general direction from S. to N. They are crossed by the road from Reims to St. Menehould, which runs at the foot of the heights of Moronvilliers, Nogent l’Abbesse, and thence by St. Hilaire le Grand, Jonchery, Suiippe and Somme-Tourbe. Villages are rare and of little importance; Souain, Perthes les Hurlus, Hurlus, Le Mesnil les Hurlus, Tahure and Massiges are all poor and ill-constructed hamlets scattered over the vast plain.

The winter battle began at the end of 1914. After the battle of the Marne the pursuit initiated by the Allied armies was checked after a few days, principally owing to a shortage of artillery ammunition, and the opposing forces took up position and set to work to construct extensive lines of entrenchments of a kind that had not been seen since the 18th century. South of the Aisne the German front swung round to the E. of Reims, included the hills of Nogent l’Abbesse and the forts commanding them, and ran thence along the Roman road S. of the Moronvilliers heights, crossing the Suisse above Aubérive and passing S. of Souain, Perthes and Massiges and N. of Ville sur Tourbe to the Aisne. The choice of this line was not dictated by either strategical or tactical reasons. The two adversaries installed themselves in face of each other by means of a series of successive engagements, the German object being to maintain an unwavering defensible position.

The French Higher Command considered that, despite the munitions crisis, the offensive must be resumed. The moral of the troops might well suffer from the wearsome hardships inseparable from trench warfare, for a kind of Siege of Sebastopol on a large scale appeared ill-suited to the temperament of the French soldier. Moreover, the “home front” had also to be considered; and finally it was necessary to do something to divert the enemy’s attention from the Russian front. The British had opened their offensive sooner than the Germans had be-
chieved possible, and had thus contributed in no small degree to the victory on the Marne. But though this result had been achieved the first promise of their operations had not been fulfilled, and their initial success had been followed by a crushing defeat. It was thus of the first importance to hold fast on the western front as many as possible of those enemy troops who might be diverted eastwards if the situation there were permitted it. French losses, however, were not unaccompanied with regular change of hostile situation. It was believed that the Germans too were suffering as acutely as the Allies from shortage of munitions, while the supposed losses in men and wastage of material were much in excess of the truth. All these causes contributed to Gen. Joffre’s decision to adopt offensive policy, which was expressed in a general order issued to his armies on Dec. 17. “The hour for attack has sounded,” it ran. “We have hitherto checked the enemy’s effort; and now it is a question of breaking it and definitely freeing our violated national territory.” It seemed as if a general offensive was to be undertaken on the whole front from the Swiss frontier to the North Sea; but as a matter of fact all that took place was a few isolated operations, notably in Flanders, Artois, and Champagne.

The IV. Army, under Gen. de Langle de Cary, this time held the line between the V. and III. Armies from Marquizez farm near Prunay to a point between Boureilles and Chalad in the Argonne. From left to right the front was held by the XII. Corps (to which were provisionally attached the 91st and 96th Territorial Div.), the 6th Reserve Div., the XVII. Corps, the Colonial Corps, and the II. Corps.

The operations began on Dec. 20 after a short artillery preparation, and although they were carried out on a wide front from Prosses to the Argonne the results were not great. The offensive continued on the 21st and met with no better success. The XII. Corps lost heavily and was compelled to cease its attacks; the XVII. and Colonial Corps continued their efforts on Dec. 22, 23 and 24, capturing a part of the first German line at the price of numerous casualties. On the 25th the operations were suspended, and the enemy in his turn delivered a series of counter-blows which were repulsed. Towards the end of the month the IV. Army was reinforced by the IV. Corps from Picardy, which for the time being was held in reserve. At this period portions of the whole of the army corps (III., V. Armies) were opposed to the Allies in Champagne; from left to right these were a fraction of the VI., the XII. Reserve, the VIII., the VIII. Reserve, the XVIII. Reserve, a fraction of the VI., the XIII. and the XVI. Corps, besides Landwehr formations.

At the beginning of 1915 the situation was still very delicate in the Argonne, where the Germans reported every day captures of men and material, which French communiqués were unable effectively to dispute. This succession of minor checks could not fail to exercise some effect on the position in Champagne and to hinder Allied progress there. The enemy’s resistance was very stubborn, and he passed from defence to attack on more than one occasion. Up to the end of Jan. the Allies continued the same monotonous series of small attacks in the Perthes–Beaumont area, the net result of which was a small gain of ground to the N. of Beaumont and Massiges. Continual bad weather and fogs then induced the command to order their cessation. By Jan. 15 the line had been pushed some 2,000 yd. to the N. of that held on Dec. 20; this had been effected after some 12 attacks and about 20 counter-attacks had been beaten off. In comparison with the terms of the general order for the offensive the smallness of the results achieved was striking, and the German High Command did fail to use its opportunity of pointing this out, affirming that their opponents’ losses on the whole front during this period were 26,000 dead and 17,800 prisoners, and the total casualties, including the wounded, 150,000 men at least, while their own losses were less than a quarter of this figure. It was stated that the German estimate of Allied casualties was 100% too large; but it seems certain that even so they were much in excess of those suffered by the enemy.

From Feb. 1 to 4 the front in Champagne became even more active; the French continued to progress slowly in the Perthes district, but on the 3rd there took place three German counter-attacks, to the W. of that village, N. of Mesnil and N. of Massiges, and in the last-named alone they met with some success, breaking the French main position on a 2,000-yd. front, and capturing over 600 prisoners, 9 machine-guns and 9 guns of small calibre. On Feb. 10, by a misunderstanding, an isolated attack was delivered near Souain by the 60th Reserve Div. against Salles and was driven back; afterward the French retook the lost ground in the afternoon and captured over 700 prisoners.

The general offensive which was to take place on this date was postponed to the 12th, and then to the 16th. The Russians had just been defeated in the Masurian winter battle, and their X. Army had been practically destroyed. French G.H.Q. considered it essential to assume the offensive on a considerable scale in order to hold fast the German troops on the western front; an easy victory was expected and Vouziers was given as the ultimate objective of the advance. On Feb. 16 5,000 yd. of trenches were captured between a point N.W. of Perthes and N. of Beauméjou, with over 400 prisoners. The IV. Corps was held behind the XVIII., ready to intervene. During that night ten German counter-attacks were repulsed; further progress was made on the 17th N.W. of Perthes, and prisoners were taken belonging to six different German corps—a singular mixture of units on so narrow a front. Two violent counter-strokes took place that night and the next morning between Souain and Beauméjou, but met with no success; five further efforts were equally repulsed during the night of Feb. 18–19. Fighting continued all next day, the advancing French troops meeting everywhere with stubborn resistance; they succeeded, however, in capturing a redoubt N. of Beauméjou, and another work N. of Le Mesnil. These partial attacks naturally proved unduly expensive in view of the results achieved; by the 27th the total of German prisoners taken since the 16th amounted only to 1,000, and the initial hopes with which the operations had been begun had thus in no sense been fulfilled. Meanwhile a new corps, the XVI., had been brought up from the Ypres area, and it was for the moment intended to use it in a new and powerful effort on the left of the battle front.

After the capture of the redoubt N. of Beauméjou on the 27th, units of the Prussian Guard which had recently arrived in Champagne delivered a night attack N. of Le Mesnil, but lost heavily and were defeated. French progress between Perthes and Beauméjou continued and by March the crest of the ridge parallel to the front of attack was secured. On the 3rd again the whole of the German trench system was taken to a depth of 1,000 yd. on a front of 6,000. On the 7th there commenced a series of attacks against a small corpse—Salbot wood—which continued till the 15th; every day saw the same monotonous repetition of partial attacks and counter-attacks, every gain of ground being dearly purchased from the stubborn enemy.

On March 10 the German High Command announced that the winter battle in Champagne was virtually at an end, and that it had brought no change whatever as far as concerned the final result of the war. The main object of the French, to relieve the pressure on the Russians, had not been realized, any more than the proposed penetration to Vouziers. The Germans had made more than 2,450 prisoners; they had certainly lost heavily, more heavily even than in the Masurian battles, but still hardly more than one-third of the French casualties, which exceeded 45,000; and the new front in Champagne was more firmly established than ever. French G.H.Q. affirmed not least definitely, in a note issued on March 12, that the operations had attained all the objectives both local and strategic; it was advanced to a depth of some 2,000 to 3,000 yd. on a front of 7,000 and had obliged the enemy to throw in reinforcements equivalent to a new army corps.

Both these assertions are disputable. The principal French objective, the relief of the Russian front, had been only imperfectly achieved. What were these 20-odd battalions diverted to Champagne in comparison with the masses engaged on the two fronts? Vouziers was still far off. The effect of the French attacks was greater than the enemy were willing to admit, it is
true, but they were out of all proportion to the sacrifices made. The truth is that the French methods had been found unsuited to the gaining of any real success; better artillery preparations, a larger scale of attack, not as hitherto a series of successive efforts on a narrow front, but an advance by large attacking waves along all the front of assault, and closer support of the infantry by the artillery, which should follow the advance and not remain in front of its first positions, were necessary.

The winter battle, however, was not yet over. On March 12 the offensive was resumed N.E. of Le Mesnil. By the 15th practically the whole of Sabot Wood was at last occupied. Operations continued in the next few days between Perthes and Souain, in the Perthes sector, N. of Beauséjour and N. of Le Mesnil. Every foot of ground was bitterly contested, as wit- ness the fighting for Jaune Brulé wood on March 18; but not till the 23rd did the French slacken their efforts. A letter of congratulation was addressed to the IV. Army by Gen. Joffre, and it was ordered to cease its attacks and consolidate its gains. One corps, the VIII., had alone lost close on 8,000 men, including 160 officers, between Feb. 16 and March 23.

Still the Champagne remained active. On April 8th, a violent German attack on Beauséjour redoubt was repulsed after an initial success. Thenceforward the enemy had recourse in the Perthes-Beauséjour area to mine warfare, with its alternative of long delays and sharp assaults. In May the French operations in Artois, and those of the enemy in Galicia which brought about the large-scale Russian retreat, threw the course of events in Champagne into the background. The only action of importance was a German repulse on May 16 at Ville sur Tourbe, of which their first communiqué made so much. In fact an assault delivered by two regiments in close order, following on the explosion of three large mines, resulted merely in the seizure of a few trenches, which were speedily recovered by the French Colonial infantry, with heavy losses for the enemy. (B. E. P.)

III. THE AUTUMN BATTLES OF 1915

After the offensive in Artois in May and June, activity on the French side was transferred to the Vosges and the Argonne, where local attacks were delivered throughout the summer, in the vain hope of confusing the enemy’s ideas as to the point of delivery of the forthcoming offensive. At the same time preparations were taken in hand for an attempt in Champagne on a larger scale than before, and for a simultaneous and powerful diversion in Artois. The situation seemed to favour it. The increase in the British strength had permitted Field-Marshal French to extend his front; the French defensive system had now been so perfected as to allow of a reduction in the garrisons of quiet sectors and a proportionate increase in the reserves available. New divisions had been formed, and methodical instruction of the troops destined for the attack had been taken in hand. Finally there had been a great increase in the available supply of guns and shells.

In Champagne the object aimed at was nothing less than the complete rupture of the German lines on the front Bazancourt-Gratulation, as to outflank their left N. of Reims and their right in the Argonne. It was also hoped, as before, to disengage the eastern front. The plan was to attack on a front of 25,000 yd. between the Moronvilliers hills and the Aisne.

The German defensive position, both in Artois and Champagne, consisted of a continuous front system, with several successive lines of trenches, and further back centres of resistance, themselves immense closed works, with a maze of trenches, capable each of holding out against assault. As a general rule these were some 2,000 yd. apart, but their exact situation was modified in accordance with the ground. This front system, comprising from two to five separate lines, and some 500 to 500 yd. deep, was followed by a second, traced on the ridge to the S. of the Py valley. It was carefully organized and provided with machine-gun positions and thick belts of wire sheltered on the reverse slopes.

At the beginning of Sept. the Germans had 70 battalions in Champagne, belonging to the III. Army (von Einem) and to the 50th Div., XIV. Corps, and XII. and VIII. Reserve Corps. During the artillery preparations which preceded the French attack they brought up 20 more (a division of the III. Corps, the 183rd Brigade, and half of the 43rd Reserve Div.), making in all 99 battalions on the first day of the battle. Ninety-three further battalions had to be put into line to fill up the gaps, so that their forces were practically doubled during the fighting; these were drawn either from the units at rest, such as the X. Reserve Corps, brought from Russia, or from the reserves of neighbouring sectors. In all, then, the Germans engaged 192 battalions. Their reinforcements came into line, not as large units with a view to being used for counter-attacks, but by small dribbles thrown in hastily as need arose; no doubt the command, fearing a break through, carried the danger as best it could by using these troops in single battalions or even half battalions. There thus resulted a regular "hotch-potch," to use Col. Feyler’s expression, on Oct. 2, between La Main de Massiges (Hill 199) and Maisons de Champagne, on a front of 12,000 yd., of 32 battalions belonging to 21 different regiments. The 5th Div., for instance, had one regiment near Massiges, one battalion of another regiment near Tabure, and one of a different battalion at Trou Doux.

On the Allied side the arrival of a new British army, the III., in the Albert area, and the extension of the VI. French Army's front to the N., had rendered possible the transfer of Gen. Pétain’s II. Army from Artois to Champagne. Under the supreme direction of Gen. de Castelnau it was to attack in conjunction with the right of the IV. Army under Gen. de Langle de Cary, and the left of the III. under Gen. Humbert, which was opposed by the German V. Army. On the left of the III. French Army, the V., under Gen. Franchet d'Espérey, faced the I. and VII. German Armies. The Allied fighting forces in Champagne numbered in all 25 divisions, or 420 battalions, at least, more than double the German forces engaged. So little effort had been made to keep the forthcoming attack a secret that, as early as Aug. 15, an order issued by Gen. von Dittfurth announced that it was expected; and on Sept. 22 Gen. von Fleck foresaw a “desperate effort” on the part of the French High Command.

Thanks to the efforts put forward to provide the French army with the heavy artillery and munitions it had lacked hitherto, the preliminary bombardment began on the morning of Sept. 22 and continued for three days and three nights without cessation, and was directed against the whole of the German front as far back as possible. At the same time long-range fire units were carried out against the hostile headquarters, billeting areas, and supply depots, and the Bazancourt to Challeranges railway. The effect was on the whole considerable, certain enemy units being left for 48 hours without rations as a result of the bombardment.

On the 22nd and 23rd the weather conditions favoured observations of fire, but on the 24th heavy clouds blew up. Next day, at 9 a.m., broke in rain, which lasted for several days. This had no little influence on the result of the battle.

At 9:15 a.m. (zero hour) the assault took place along the whole of the long front, and the first infantry waves, in an irresistible rush, broke into the enemy's trench system. On the left the attack was directed against a salient between Aubervilliers and the St. Hilaire-St. Souplet road; the first trench was taken but the attack was held up by uncut wire in front of the second line 1,000 yd. in rear. At the same time a counter-attack from Aubervilliers, supported by the fire of the heavy artillery on the Moronvilliers ridge, took the French in flank; the left was forced back but at the right held its ground. This first phase was very short, and thanks to weak resistance the French suffered little.

The enemy had another strongly fortified redoubt E. of the St. Hilaire-St. Souplet road. A stride this road to the left of it the French infantry broke into the first hostile trench system were checked by machine-gun fire. To the right the assailant units carried four lines of trench, covered by belts of wire and sheltered in the woods, capturing 700 prisoners and 7 guns and penetrating the hostile lines to a depth of 2,700 yd. In the Souvin valley, which marked the right boundary of the IV. Army area, the advance was pushed forward rapidly in three different directions; to the W. it reached the wood of William II., 2,000
CHAMPAGNE, BATTLES IN

On the remainder of the front, as far as the Aisne valley, the pressure of attack continued by means of violent bombardments, bombing attacks and local offensives. But on the 26th the 39th Div. was driven from Maisons de Champagne, and a fresh attack by the 153rd Div. on the 27th in the same region only partially succeeded.

On La Main de Massiges the Germans received reinforcements drawn particularly from the XVI. Corps, and French progress henceforth became more difficult. None the less the I. Colonial Corps continued to advance between the 25th and the 26th. To the N. it reached Mont Tétu (Hill 199), and pushed down towards Ville sur Tourbe, capturing prisoners and material.

By Sept. 28 contact was made with the German second position on a front of 13,000 yd. from S. of St. Souplet and Somme-Py. Westwards the line bent back towards Aubervie, which was still in enemy hands, as was also the hill of Le Mesnil and the neighbouring woods to the E. But progress towards Tahure and Ripont and possession of La Main de Massiges secured the envelopment of this last position on both flanks.

On Sept. 28 and 29 the French succeeded in setting foot in this second hostile position at certain points such as to the W. of Le Mesnil hill and Navarin farm. In this last sector they had even breached this line, but on such a narrow front that the enemy easily succeeded in preventing any further penetration. All hope of a break-through had disappeared. The V. Cavalry Corps, which had been brought forward in view of seizing any chance of exploitation, returned on the 28th to St. Remy, without even having gone into action. A general order dated Sept. 30 announced the close of the operations, the results of which included the capture of 25,000 prisoners of whom 350 were officers, 150 guns and a large amount of material of war.

On Oct. 6 the second German position was almost intact; the attack was held up in front of it in extremely difficult conditions; the French troops were in poor and half-finished trenches, hastily dug on bare slopes and exposed to flanking and enfilade fire. The attacks which continued till Oct. 8 were difficult to carry out and cost many men. Tahure hill and the two Mamelles (Hill 187) N. of Le Mesnil were, however, taken, but Le Mesnil hill remained in enemy hands. Several attacks and counter-attacks took place at the end of Oct. and the beginning of Nov., without resulting in any material change in the situation.

According to Gen. Mangin the Sept. offensive in Champagne cost the French 80,000 killed and missing and 100,000 evacuated sick or wounded. It was therefore extremely costly, and one cannot say that the results achieved were in proportion to the sacrifices and efforts. The Allies had engaged in Champagne and Artois 52 French and 13 British divisions, more than were put into line at the battle of the Marne. These masses were supported by 1,300 French and 300 British heavy guns. The consumption of munitions by the II., IV., and X. Armies attained enormous proportions—3,580,000 rounds for the 75's and 987,000 for the heavy artillery. It was admitted that this last figure especially was too small for good results to be achieved; the Allied fire had been insufficient to destroy the enemy's accessory defences or the trenches of the second and third lines, especially on the reverse slope. Finally the front of attack, 25,000 yd., was not wide enough to prevent effective flanking fire.

In short, the offensive had not all the character of suddenness, rapidity and continuity that was desirable, and it went on too long, involving heavy losses without hope of decisive results. Thus there arose the conception of offensives with limited objectives, which when adopted as a general policy became fatal. In some quarters there began to be observed the German ten- 

dency towards what can be called "nibbling"—that of "nibbling" at the enemy by partial attacks; it was forgotten that by this means the Allied troops used up their moral and physical strength at least as rapidly as that of their adversaries.

(B. E. P.)

IV. THE FRENCH OFFENSIVE ON THE AISNE, 1917

Plan of the Offensive.—The Allied plan of campaign for 1917 was drawn up, like the preceding one, at a conference which
Assembled at Chantilly, on Nov. 18, 1916, together with the commanders-in-chief, Joffre and Sir Douglas Haig, and all the heads of the British, Italian, Russian, Belgian, Serbian and Rumanian Missions.

The formation of new German divisions led it to be supposed that there would be a repetition of an attack during the early days of the spring, probably on the western front. It was therefore decided that active operations should be pushed forward on each front in every possible way compatible with climatic conditions. "In order to deny to the enemy the initiative in resuming operations, the Allied Armies will be ready to make a joint offensive from the first half of Feb. 1917, with all the available forces at their disposal." The beginning of the offensive would be fixed according to circumstances and by common consent of the commanders-in-chief, who would maintain between themselves the "closest liaison." The Russian High Command declared its willingness to undertake the task of putting Bulgaria out of action; the Allied Army in Salonika, brought up to a strength of 23 divisions, should cooperate. The mutual support that the Allies gave each other during the preceding year should continue, and the Franco-British and Italian staffs should jointly study questions of transport and the cooperation of troops.

General Joffre therefore drew up from Nov. 27 a general plan of attack. From Feb. 1 the French armies were to be ready to attack between the Somme and the Oise, at the same time as British forces between Bapaume and Vimy; from Feb. 20, the group of armies forming the centre would attack in their turn in Champagne between Pontavert and Reims.

The method of these attacks is detailed in instructions dated Dec. 16 and based upon experience gained both at Verdun and on the Somme. They were to take place on as large a front as possible, to aim at carrying the enemy's artillery positions in order to disorganize the defense and capture of their guns, and to follow each other with the shortest possible delay in order to gain the whole advantage of any results obtained. The break-through was to be exploited boldly and vigorously; for it is the strength and rapidity of attack which ensures success. The tactical development, which must be indicated in operation orders, is to be realized by the grouping of forces according to the lie of the ground, the strongest forces being reserved for those sectors where progress can be most rapid. The preparation of attacks with artillery support is moreover studied in detail in these instructions; they indicate clearly, however, a change of method and consider the possibility of being able to break the enemy front by mass attack rapidly executed, carefully prepared and studied in its smallest detail.

The question of exploiting a successful attack is not forgotten, and its rapidity should embarrass the enemy and anticipate the arrival of his reserves; the attacks have a definite objective, but they are no longer forced to limit themselves to this objective.

M. Briand's Government strongly urged decisive offensive for the spring of 1917; political parties supported this. The effect produced on the public mind by the prolongation of hostilities and by a war of attrition was exaggerated; it was feared that German submarines would prevent the import into France of food and raw materials; lastly, the maintenance of combatant forces was, it was stated, becoming difficult. In the Chamber of Deputies the War Commission in Dec. handed to the Government the report of M. Violette supporting its conclusions: "If we are wise, we shall recommence active operations from the end of Feb. . . . the initiative in the great battle is a question of life or death for France."

It was in these circumstances that Gen. Nivelle took over the command of the French armies, in order to carry out the operations decided upon by the Allied Governments, drawn up by the Allied general staffs, and in which the plan of attack had been decided upon in general instructions issued by his predecessor. He considered that the front of attack might be slightly extended, and that there would be a great advantage for the progress of the offensive in Champagne in capturing the Chemin des Dames, a formidable position which overlooked the whole plain, and which assured him a bridgehead on the right bank of the Aisne.

Furthermore, the attack on the Somme and that on the Aisne must be simultaneous, and not successive, as in the original plan.

The Anglo-French offensive in the N. was to begin with a considerable straightening out of the British front.

Sir Douglas Haig was to attack Vimy with his I. Army, at the same time the 111. and V. Armies should reduce the pocket left between Arras and Bapaume after the success of 1916. Following this, a concerted action should be undertaken in conjunction with the northern group of French armies, which was to operate between the Somme and the Oise. General d'Esperey had relieved Gen. Foch of his command, the latter having been unjustifiably placed in disgrace after the battle of the Somme, the results of which were misunderstood.

On the Aisne the French offensive was to stretch from Valley to Reims; Gen. Pétain, having been consulted by the new commander-in-chief regarding the offensive that had been planned, had very frankly expressed his criticism, which made it difficult to employ him in carrying out the operations. General Nivelle therefore entrusted their preparation to Gen. Micheler, who at this moment was strongly in favour of a lightning mass attack.

The V. Army under Masel, which had occupied the front of the attack since 1914, closed up on its right in order to make the VI. Army, of which Gen. Mangin had just assumed command; the X. Army under Duchesne was held in reserve in order to exploit any success after the line had been broken.

The operation plans were drawn up for the various branches of the command according to the usual procedure. The general officer commanding, Gen. Nivelle, gave directions and indicated the form of attack; the commander of the group of armies, Gen. Micheler, fixed the objectives; the commanders of the armies, Masel and Mangin, shared the task amongst their army corps, and the instructions which were given to them were strictly limited to the role of their armies in the battle. It could not be otherwise, the commander-in-chief alone is in a position to conceive and draw up the plan of an offensive on a grand scale, as this presupposes a thorough knowledge of the general situation, of the possible cooperation of Allied armies, of the strength and resources of the national armies and of the enemy armies, as well as the instructions issued by the various war commissions—and finally of the intentions of the Government.

General Nivelle had decided on a smashing attack, aiming with the first assault to capture the enemy positions and the entire zone occupied by the artillery; this idea was in accord with the orders issued on Dec. 16 and signed by his predecessor, and carried out on two occasions under his orders at Verdun. Such an operation appeared quite feasible, and no one raised any objection to it. He foresaw also, immediately after the break-through, the possibility of rapidly exploiting his success; the breach made would be immediately enlarged on both sides and the "armée de manoeuvre" brought into action: "the later development of the operations having as its object to bring the main forces as rapidly as possible in a northerly direction: the main pivot Cramoy-Guisse."

General Micheler, in transmitting these directions, added that, in the case of success of the operations, the operations could be accomplished either on the day of attack or at the latest on the morning of the following day. As the objective to be reached he sketched a line passing to the farther side of the hills which overlook the north bank of the Ailette, reaching the plain of Laon to the N. and pushing in an easterly direction beyond the fort of Brumont.

The first schemes of the operations called forth exchanges of opinion, as is always the case under similar circumstances. The only reservations were made by Gen. Mangin, who asked that preparations for attack, followed by this actual carrying out, should take place on several other sectors of the front, in order to obtain at the very least a relative surprise; he asked for exceptionally powerful artillery in order to shorten the period of preparation without endangering the actual task of destruction; and he added: "Seasonable weather is of great importance; march rapidity demands good going of the roads; the development of the operation would be assisted when the days are long and the nights clear. It is to be hoped that operations carried out prior
to the main attack would have denied to the enemy freedom of movement and initiative in attack, and that we shall be able to hope for the splendid day when we shall be able to bring into action our colonial forces." He pointed out to the commander-in-chief that, on a front of attack so difficult, without direct ground observation, it would be very nearly necessary to wait for five days, when aerial observation is good and the ground hard.

These requests and observations were submitted to the High Command as an appreciation to be examined and compared with all others and to affect the final decision, which was the responsibility of the commander-in-chief alone.

General Nivelle never ceased repeating that it was necessary "to go on as far as possible" after the day of attack; Gen. Micheler fixed a first line to be reached in three hours and a second line three hours after. He went into ten minute details which did not allow any initiative to his subordinate commanders; some differences arose which Gen. Nivelle had to smooth over.

To go on as far as possible implies that the attack continues until it encounters an obstacle which it cannot overcome without the help of new and methodical preparation; it is not by orders issued that the attack will be stopped, but by the action of the enemy. The High Command prepares itself to profit by the confusion brought about so often at various points of the field of battle, and, with this end in view, prepares its subordinates by pointing out very distant objectives. This is a principle second to none, and its application in 1918 brought victory to the French after giving the Germans their victories in March and May.

The necessity of foreseeing the exploitation of any success after a break-through is obvious; it was particularly evident in 1917. It was necessary to compel the general staffs and cadres of all formations to study the requirements demanded in a war of movement (which for a long time were lost to view), to think out the equipment of the foot soldier and the lightening of kit, the formation of columns, their march and supply, to decide upon the grouping of the heavy artillery which should rejoin in succession each army corps and army, to study natural obstacles, the network of roads, etc.

General Micheler obviously went rather far when he contem- plated a threat on the enemy communications, "who would then be squeezed up between the Ardennes and the southern point of Holland," but this anticipation, realized in the following year, did not go beyond the general staff of the armies.

Military Situation.—The preparations for the offensive were in full swing when, on March 14, the withdrawal of the German line on the Hindenburg position was completed; this extended, on March 19, to the front between the Oise and the Aisne. The pursuit was immediate and vigorous. The Germans were hustled on to a prepared line, a line at which they had prepared to limit their withdrawal and to allow themselves time to organize at leisure the Hindenburg position. The completion of their field works, hampered by artillery fire, cost them considerable losses.

The German retreat had long been thought out and prepared. Only a small quantity of booty fell into the hands of the Allied armies. The evacuated zone had been systematically destroyed. It was pointed out to the High Command that all the roads of communication had been destroyed—that was war; to destroy inhabited places which could be used as a shelter for troops and which were near to the firing line is admissible, although this practice is strain- ing severely the demands of war necessity. But to devote a large quantity of explosive to blow up stately ruins, like those of the castle of Coucy, and much manual labour to cut down the fruit trees—that is savagery.

It is essential to point out that important means of destruction were thus diverted from military use; by blowing up larger stretches of road, by felling a larger number of trees planted along their line of retreat, the Germans could have hindered to a great extent the advance and supply of the French troops. But not only against the Allied armies did the Germans wage war, but against the people of France, struck at in their past as in their future, in their artistic, industrial and agricultural wealth.

The plan of operations drawn up by Gen. Nivelle was necessarily modified by the withdrawal of the German line; the prepara-
the ministerial office to draw up a dossier against the offensive scheme, and he was disturbed about it. Nevertheless, none of the generals interrogated recommended that the offensive should be given up; they did not believe that it would lead to all the results foreseen by their chief, but they did not take the responsibility of advising its abandonment. Their opinion, therefore, was limited to absolutely sterile criticism. On March 24, M. Painlevé also consulted Sir Douglas Haig and a number of British officers; without going into details of method, their unanimous advice was “to strike rapidly, with full force, a great blow at the enemy”; and he became convinced at the beginning of April, after the Russian revolution and the entry of the United States into the war, that the British were absolutely in favour of the great offensive.

It would have seemed that the Minister of War would be satisfied with this. But, on April 3, a conference was held at his instigation at the Ministry of War between M. Ribot, President of the Council, the Minister of War, the Minister of Marine Adm. Lacaze, the Minister of Munitions M. Albert Thomas, the Minister for the Colonies M. Maginot, and Gen. Nivelle. The question for discussion was to examine if the offensive, the date of which was fixed for April 8, should take place in the new situation following the German withdrawal, the Russian revolution, and the entry of the United States into the war.

This conference, which took place five days before the date fixed for the offensive, was useless; it was unable to decide anything, unless it were the meeting of the War Committee to examine the Chair-decision of the President of the Council of May 20, which was a reason to interfere with the British, in order to modify the plans drawn up in agreement with them and of which M. Painlevé had just learnt that they were firm supporters. Worried by questions concerning the way in which the attack would be unfolded, the commander-in-chief affirmed his unshaken belief in a rapid break-through, followed immediately by the foreshadowed exploitation which would, in the course of about three days, bring the group of armies under Micheler up to the Scelle, 30 km. from his position of attack. In the course of the discussion, the necessity of destroying the Somme river and second lines was pointed out, as well as the advantage of attacking when the weather was favourable.

It was decided that “the commander-in-chief should attack on the front which he had selected, at a time when he judged his preparations were complete, and on a day to be chosen by him.” He had accordingly a free hand.

Everything appeared to be settled, and Gen. Nivelle free at last to prepare for the coming offensive, when Gen. Messimy, Deputy and formerly Minister of War, commanding one of the brigades which was going to take part in the offensive, approached M. Ribot, president of the Council, and handed him a report which, he said, expressed accurately the opinion of officers of the highest réputation in the French army and notably of the Gen. who was to direct the coming offensive, Gen. Micheler.” This report called for the immediate despatch of eight French and British divisions to the Treintino, and affirmed that only limited results could be obtained from the offensive and only at the price of important losses. The report said further that the order should be given immediately to wait for fine weather before beginning offensive operations in France, and in conclusion the commanders of groups of armies should be listened to, either singly or together, commencing with Gen. Micheler.

The report did not bring out anything new, and it was fatal as in the end the irresolution of the Government communicated itself to the subordinate staffs. It was insufficient, however, to bring about the assembly at Compiègne on April 6 of an extraordinary council of war; the President of the Republic, the president of the Council, together with the three Ministers of National Defence, the commander-in-chief and the generals commanding army groups, Micheler, Pétain, d’Espéry, were present. General Foch, who held the rank of commander of an army group, had been sent hastily the day before to Italy and was therefore not present. The Minister of War asked if the new situation did not modify the circumstances of the offensive. General Nivelle pointed out the necessity for an immediate offensive, carried through to the end; the commanders of army groups were all of his opinion on this point, and Gen. Micheler, in direct contradiction to the memorandum which had brought about the war council, got up and said: “It is necessary to attack as quickly as possible, as soon as we are ready and the weather is favourable.” All expressed however, in different ways, their doubts concerning an immediate break-through.

General Pétain was particularly explicit: there were sufficient forces to pierce the enemy front but not to develop success. General Nivelle thereupon said: “Since I am not in agreement with either the Government or with my subordinates, nothing remains for me to do except to place my resignation in the hands of the President of the Republic.” Everyone then protested that it was impossible to change the commander-in-chief on the eve of an attack of which all had admitted the necessity, and Gen. Nivelle, after some hesitation, refrained from sending his letter of resignation. The net result was that the council of war broke up without deciding anything except the necessity of the offensive.

Before the commission of inquiry into the operations on the Aisne, which was called together in July 1917, Gen. Foch expressed himself thus: “Nivelle indeed acted thoughtlessly in accepting the invitation to be present at the conference at Compiègne; but I return to the point that the Government, having heard the opinions expressed at this conference, invited Gen. Nivelle to carry through the operations.” General Pétain, having recalled the fact that he had pronounced an opinion unfavourable to the offensive, first to the Minister of War and later to the president of the Council, concluded by saying: “The Government, fully informed, took no notice. The chief responsibility therefore rests on their shoulders.”

The report of the commission, which comprised Generals Brugère, Foch and Gouraud, is severe on the conference: “The doubt which had crept into the minds of the chief actors would not have been dissipated by the meeting on April 6. They did not give that mutual confidence and that belief in success which give to the commander-in-chief that energy and incentive that enable him to overcome events.” The report records that there was no intervention taken to counteract the action of the commander-in-chief nor to weaken his orders, although the majority of those who met at Compiègne considered them as unrealizable. General Nivelle was allowed a free hand, with the reservation which was not clearly expressed, that if, after 24 hours of fighting, the results were indecisive and losses too heavy, the operation should be broken off. General Nivelle, however, reiterating his belief in a rapid penetration, declared that he did not wish to offer battle in half-measure, and that he did not know what form the struggle would take, once it was engaged. However, the two officers that Gen. Nivelle had taken with him to draw up the report had been dismissed and no written statement had been made. Everything remains, therefore, confused concerning this “extraordinary” council of war, the reason of the meeting, the debates and the conclusion. The memorandum of Gen. Messimy asked that the army group commanders might be consulted “either separately or together,” but it did not ask that they should be confronted with their commander-in-chief before the foremost leaders of the State; it is necessary to point out, as well, a regrettable difference between this memorandum, which was based chiefly on the observations of Gen. Micheler, and the attitude of that general before the conference; all the army group commanders had been consulted by the Minister of War, at the instigation of Gen. Messimy, who had received satisfaction without being aware of it. The raison d’être of the conference thus vanished.

All the army group commanders considered that the offensive was absolutely necessary, and they thought that Gen. Nivelle anticipated from it results which it was not reasonable to hope for. They had spoken of this at the Ministry of War; they repeated it at the conference with different variations which, however, did not affect the essence of their declarations. With what object, then, to reproduce them? The Government are responsible for the general conduct of the war, but the commander-in-chief, their choice, has the command and the responsibility for the operations. The Government considered that the offensive was necessary and
repeated their view on April 3. If they no longer had confidence in the commander-in-chief—let them remove him. Even if this confidence continues or if it diminishes after a change of command on the eve of an attack, why take away so much of its chance of success by undertaking so hazardous a thing?

Assembled without rhyme or reason, this "extraordinary council of war" killed the confidence between the commander-in-chief and his subordinates, a confidence already affected; this ordeal, which had never before been inflicted upon a military commander, threw Gen. Nivelle into a state of anxiety, however impassive he might be before the enemy in battle.

The Offensive.—In accordance with the instructions of Gen. Nivelle, the British offensive commenced on April 9 before Arras and was continued until April 14 with great success.

It is true it had not effected a break-through but the advance was important and the booty taken considerable: 14,000 prisoners and 104 guns. The battle continued on this front. On April 14, the army group under d'Esperey had felt the Hindenburg line at the approaches of St. Quentin and had recognized its strength without being able to make any impression with the weak effective available.

Fixed for April 12, postponed to the 14th and then to the 16th on account of bad weather, the offensive on the Aisne had been prepared in minute detail. First of all, it had been necessary to develop the lines of communication between the Marne and the Vesle and from there up to the front lines. A hundred and ten kilometres of ordinary gauge line had been constructed, 20 km. of metre gauge, 328 km. of 60-cm. gauge; 25 km. of cart roads and 45 km. of air lines. The existing lines had been broadened on a length of 55 km.

Twenty-two thousand men had been employed on this task. Four thousand five hundred tons of transport with an effective personnel of 28,000 men represented the automobile sections. Fourty kilometres was the front of attack; the VI. Army under Mangin, with a front of 15 km., consisted of 17 infantry divisions, one cavalry division and one territorial division; the V. Army under Masen, on a 20-km. front, consisted of 20 infantry divisions, and one cavalry division. The VI. Army had 742 heavy guns, 846 field guns, 81 large-calibre guns, 593 trench mortars. The V. Army had 1,016 heavy guns, 866 field guns, 1,056 trench mortars, 91 large-calibre guns.

The plan of artillery employment allowed quiet registration from April 2 to April 4, counter-battery work on the 5th and 6th; then the destructive bombardment commenced on the 7th and was to have been complete on the 11th; it was continued until the 17th, owing to the postponement of the attack. More than 3,000,000 rounds were fired.

The shooting, however, was hampered by rainy weather and by bad organization of the fighting planes, concentrated unfortunately with the army groups. During the too rare flying hours, the range-registering planes were not protected, and Gen. Mangin's urgent calls for their protection by fighting scouts met with no response. The VI. Army under Mangin had not been able to collect the number of short-range guns that had been asked for to destroy the Hindenburg line on its left, nor the long-range guns that had been asked for to accompany the attack on its right. Nevertheless, and in spite of what may have been said, the preparation was good on the whole and the moral of the troops had risen to the highest pitch. The Hindenburg withdrawal was rightly considered an avowal of weakness; the Russian revolution had removed a Court and a Government bound to Germany, and it was looked upon as an outburst both patriotic and liberal which recalled the dawn of the French revolution. The existing roads had been broadened on a length of 55 km.

The existing roads of the Government and of certain of the staffs had not had time to permeate the troops.

On the morning of April 16, the French infantry rushed from their trenches and captured the first German line on the whole front. The right and centre of the V. Army advanced two to three kilometres. The tanks, used for the first time, were detailed for the capture of the third enemy position; their unexpectedly slow progression left intact the observing posts of the Germans from which they directed the fire of their artillery on them; and owing to the too long distance which they had to cover they had loaded themselves up with extra petrol cans which were set on fire by the shells. The infantry had not been trained to cooperate with them and profited little from their advance. They suffered heavy losses; in this first experience the heroism of their crews bought very dearly slender results.

The left of Masen's army was immediately stopped on the Craonne plateau. The 10th Colonial Div. of the VI. Army under Marchand captured the position of Utrelzhe with magnificent dash and some elements reached as far as the Alleute; but on the plateau of Craonne and Vaulcerc, the enemy machine-guns came up out of deep dugouts where they had remained under the shelter of the artillery. The struggle was very severe, and the detachments that had penetrated too far were taken in rear and compelled to retire. In the centre, progress was more satisfactory although difficult; the attack, stopped after an advance of between 500 and 2,000 metres, was renewed; on the left the set-off was good, but the advance was rapidly held and even thrown back at certain points on to its initial line.

The battle had not assumed the aspect foreseen, but continued. It was not the rapid and tremendous success anticipated, but it was success. As in all dispositions for attack, there is a tendency to block in front; the reserves in closing up to the front lines are liable to get bunched together and to come under enemy artillery fire, thus suffering heavy losses; in the VI. Army, precautionary measures taken in advance enabled them to remain on the left bank of the Aisne. In addition the counter-battery work had been most efficacious and had much averted the effects of the enemy artillery. Machine-guns had stopped the attack. The system employed at Verdun under similar circumstances was immediately remembered; the centres of enemy resistance should be attacked, after having concentrated on them the fire of the necessary number of batteries, but the attack should be continued. This is less wearing for the attacker than for the defence.

On April 16, commencing at 10 o'clock in the morning, Gen. Micheler took all the heavy artillery of an army corps from the VI. Army under Mangin, then three sections of 135-mm. guns; in the evening all his reserves were taken away and his ammunition supply reduced. On the morning of the 17th, Gen. Nivelle visited the headquarters of the army group, where he was insufficiently informed of the situation, and then he took the decision of stopping the attacks of the VI. Army towards the north and of pushing those of the V. Army towards the north-east.

This order was fortunately somewhat delayed in transmission, and on the 17th the attack continued actively on the centre of Mangin's army, with a very noticeable advance on the front Brayen Laonnois—Ostel.

As the pressure continued on the front Vauxaillon—Laffaux, the Germans could no longer hold in the pocket into which they had been squeezed and they gave ground. But the order of Gen. Nivelle commenced thus: "1. The battle fought yesterday clearly indicates the intention of the enemy to hold fast on the front of the VI. Army and to make difficult and costly in consequence the advance of your army to the north. . . ."

As the situation had changed, Gen. Mangin gave orders for a vigorous pursuit, which hustled the enemy and caused him heavy losses; the commander-in-chief approved of this action the following day. The fort of Condé was occupied. At the same time a very slow advance continued on the Chemin des Dames.

Comencing on the 17th, the IV. Army under Anthoine, belonging to Pétain's army group, had attacked the Moronvilliers massif and had secured important gains. The enemy counter-attacks were shattered on the 19th. Splendid artillery observation posts remained in the hands of the French. It was a limited success, but a very appreciable one.

From the 16th-20th, 21,000 prisoners and 183 guns had been captured in the French offensive; little progress had been made, but the advance of from six to seven kilometres, on the Aisne front of 12 km., resulted in the capture of a dozen villages, together with the fort of Condé and all the observation posts which overlooked the valley of the Aisne.

The railway from Soissons to Reims was fired. At last the evacuation of Laon began. Moral remained good at the front, excellent in the VI. Army, and the efforts of defeatist propaganda,
very harmful among the French public, had not yet begun to make itself felt in the army. In the meanwhile German exhaustion continued very fast. Of 52 divisions in reserve on April 1, 16 only remained unengaged. The anxieties of the German High Command could be seen after April 16 in the unusual nature of their communiqués which appeared to prepare public opinion for the worst eventualities. From that moment their moral declined rapidly. The results were not such as had been anticipated, but they were better than those resulting from previous offensives and had been gained with fewer losses.

The number, however, of these losses were greatly exaggerated by rumours which were circulated among certain classes in France and even in certain districts where no information could have come from the front. Enemy agents worked freely and with the connivance of the highest authorities, as certain trials before the High Court and Council of War subsequently showed. In addition to this numerous French deputies had followed the attack on April 16, either from Gen. Michelher's battle headquarters or from the lookout at Roncq. Their accounts spread amongst their friends who shared all their sincere feelings. It is necessary to have a great experience of war not to allow oneself to be unduly influenced by the flock of wounded who pour back to the rear at every big attack after the first day. Having raised alarm in the French Chamber, these accounts, mutilated and exaggerated, spread amongst the public, strengthening the effects of enemy propaganda. The enemy cleverly exploited this.

It was a regular Austro-German counter-offensive, perfectly organized, which turned the French success into failure. During the course of the operation both sides always exaggerate the number of their losses, which later information diminishes as soon as the situation becomes more clear; but exceptional reasons for mistake vitiated all calculations. Precise numbers of the losses were given, very different but all enormous. The first official estimate had been obtained through wrong calculation based on an average of men killed; this calculation was arbitrarily augmented by adding thereto the number of missing. In the second estimate the wounded were counted several times over owing to their passing through the hands of various medical units, to which were added the enemy wounded who had been treated in the French ambulances. When eventually the casualty lists from the armies did arrive the wounded amongst the colonial troops and the Russian brigade had been counted twice over, and that mistake (although proved by documentary evidence) was long maintained before parliamentary commissions by the French Minister of War, who made no attempt to calm the agitation. The rumour spread that the terrible losses were due to insufficient artillery preparation, that whole battalions had been thrown into the assault against uncut wire, that no precautions were taken for the evacuation of the wounded, and that numbers of wounded had succumbed through lack of medical attention. Scapegoats were looked for and guarantees demanded.

Continuation of the Offensive in the Middle of New Complications.—The commander-in-chief continued his operations in an atmosphere that became more and more hostile to him. However, the continuation of the offensive had raised no objections either at Compiègne on the 19th, when the French Minister of War came down to inform himself of his intentions, nor on the 20th at Paris, when Gen. Nivelle had been instructed to discuss matters at the Elysée. The X. Army under Duchesne had come into action between the V. and VI. Armies on the Cramone plateau. Gen. Micheler wrote on the 21st that the offensive undertaken to the N. appeared to him to require forces superior to those which he had available, and pronounced the opinion that it would suit him if he could limit himself to local attacks which he set out in detail. Gen. Nivelle ordered then that he should limit himself to the relief of Reims by carrying Brimont and giving more freedom on the heights of Moronvillers, already captured, and at the same time to complete the seizure of the Chemin des Dames. Preparations for these two attacks began, but each one of them gave rise to characteristic incidents.

The operation on the Chemin des Dames towards Cramonne led to an overture on the part of a young French deputy, who was serving as an officer on the staff of one of the army corps detailed for the attack, to the President of the Republic, in which he pointed out to him the anxiety experienced by the generals entrusted with this operation. An exchange of notes between the High Command and the commander-in-chief was the result and a consultation of generals summoned, an example of the regrettable discussion which was going through the Government and the High Command.

The intended attack on Brimont gave rise to direct intervention on the part of the minister regarding the detail of the operation. General Pétain, who was selected to carry out the newly created functions of chief of the general staff attached to the Ministry, received in his department the scheme of all the operation plans. M. Painlevé, whilst conferring with Gen. Masel, commanding the V. Army, explained the detail of the operation against Brimont, and it seems that a misunderstanding arose between the two speakers regarding the probable number of losses. The scheme gave rise to conversations which lasted from April 22 to 29, and the minister instructed the commander-in-chief to suspend the attack on Brimont which the artillery had begun to prepare for. Generals Nivelle and Pétain were invited to discuss this question on the 30th, and the mutilated plan which appeared as a result of these conversations ended in the small attack of May 4 against two commanding positions. The French seized them, but they were driven off after losses which were really fruitless. Decisions taken affecting the direction of the French armies were the result of indifferent compromise between divergent wills; they were no longer commanded.

The British Government meanwhile, anxious regarding the results of the submarine war, were alarmed at the same time at the intentions which the French Government expressed.

Before the attack on April 16 they had learnt that the French War Cabinet intended to suspend the offensive at the end of a few days if the anticipated results were not attained, or at any rate nearly so. Also, as early as the 18th, Mr. Lloyd George asked Sir Douglas Haig "what would be, in his opinion, the effect produced if the French War Cabinet instructed Gen. Nivelle to cease offensive operations at a not-far-off date."

The noteworthy reply that Sir Douglas Haig made to this question on April 19 must be mentioned:

"In my opinion the decision to suspend immediately the offensive operations, until such a time when Russia and America should be in a position to join us (probably not before next spring), would be most unwise. The struggle is following a normal course. Great results are never obtained in war so long as the enemy power has not been broken; and against an enemy both powerful and determined, operating with large effectives on a broad front, it is a matter of time and hard fighting." Sir Douglas Haig asserted afterwards "that the chances of success, this year, are remarkably good, if we do not relax our efforts," and he stated that "the future would confirm that forecast—that the suspension of the offensive would be more costly than the offensive itself."

On the 26th Haig was called to Paris to confer with M. Ribot and M. Painlevé, who pointed out to him the enormous losses of the French army: 25,000 killed and 95,000 wounded, they said, when the real numbers, confirmed at this time by the casualty lists of the armies, were 15,000 and 60,000; they considered the necessity of stopping the offensive.

Before the members of the French Government Sir Douglas Haig maintained the view that he had expressed to his own Government; the results were not those that had been hoped for, but were such that he found them satisfactory. The German reserves were at this moment inferior to the Franco-British reserves; it was therefore necessary "to continue the battle to the end." On being asked a definite question by Sir Douglas Haig the members of the French Government replied that "the battle should be continued without modification of the general idea of the plan of operations drawn up conjointly."

The British Government became more and more anxious owing to the hesitation displayed by the French Government, and instigated two conferences which were held at Paris. At the first Gen. Pétain and Nivelle, Field-Marshal Sir Douglas Haig
and Sir William Robertson, Chief of the Imperial General Staff, met together. In reviewing the general situation they were forced to admit unanimously the absolute necessity of continuing offensive operations on the western front. A large part of the German reserves were exhausted, but if the enemy was given time to recover himself he would be free to attack either Russia or Italy with the greatest chance of success, and he would thus be able to use the suburbs of Paris to his heart's content, which he had evidently not been able to do to any appreciable effect. In the new situation it was not a question of breaking the enemy front and of reaching at one blow distant objectives, but of exhausting the enemy's resistance. Once this object was gained "it was necessary to develop the results to the utmost possible."

The members of this conference were of the same opinion when they affirmed the necessity of fighting with all forces available, with the object of destroying the enemy divisions. "We are unanimous in thinking that there is no half-measure between that method and a defensive, which at this moment would be equivalent to a confession of weakness. We are unanimously of the opinion that our aim cannot be arrived at except through unceasing attack, with a limited objective." Allied staffs would determine methods and dates.

In the afternoon of the 4th the ministers of the two countries met at the Quai d'Orsay together with the members of the military commission. Mr. Lloyd George explained that he felt the need of persuading himself that all were quite agreed on the principle of the continuous offensive, the details of which were settled by the responsible authorities: "We prefer that the generals keep to themselves everything which concerns their plans of operation. When they are put on paper for communication to ministers it is seldom that the ministers alone see them. What we do not need to know is the precise locality of the attack, nor the date, nor the number of guns and divisions engaged. It is essential that these details remain secret. In England we do not ask these questions." He changed the preamble of the military commission into a formal pledge of the British Government, specifying always that the expression "limited offensive" was not to be understood as an attack by two or three divisions, but as an operation analogous to that which the British armies had just carried out before Arras. Mr. Lloyd George further insisted that, considering the situation with which both parties were faced, a serious and continued effort was absolutely necessary. He endeavoured to show the French Government all that had been done since the month of April: "We must not allow ourselves to underestimate the results of our offensive. Doubtless great hopes had been held that had not been realized. But if we did not hope for more than was possible perhaps we would not find that enthusiasm which was so indispensable in war."

He enumerated the captures: 45,500 prisoners, 450 guns, 800 machine-guns and 200 sq. km. reconquered. "Suppose that it had been the enemy who had obtained this success ... and imagine the wave of pessimism that would have swept over the public. That is sufficient to show the reality of the success which we have gained. ... The losses which we suffer are very painful, but it is impossible to avoid them if we wage war. ... If it is a question of saving human life we say that feeble and repeated attacks cost as much as, and more than, wholehearted attacks. ... I hope that these considerations will lead you both," addressing personally M. Ribot and M. Painlevé, "to admit that we must exert all our efforts at once."

The Prime Minister of England spoke in the forcible and virile language of a true statesman. Well informed of the situation in his own country, he sensed the value of time when it came to men and money. He understood war and all its exigencies, even the hardest; he was capable of the high direction of war because he knew how to govern the expert without entering into the detail of his technique. Mr. Lloyd George took with him to England a written promise, but it was wrapped round with such reticence that he could not have had many illusions concerning the duration of the attack "sans répit" to which the French Government had just pledged themselves.

Whilst the British offensive was in full swing on the Scarpe the struggle continued in Champagne on the Moronvilliers massif; a violent German counter-offensive had been repulsed on April 23 and the IV. Army under Anthonie seized Mount Cornillet. The Craonne massif was seized on May 4, and the mill at Laffaux on the 5th, together with a whole series of positions which the German counter-attacks failed to retake; it was a good success, but it should have been completed by advancing to the Ailette, for the X. Army held on to the crest with difficulty, and the preparation of a new offensive was thus delayed for the want of detachments. But the success of the Allied offensive was due to the suspension of the offensive and not to the offensive itself.

The results of the Franco-British offensive were 62,000 prisoners, 446 guns and 1,000 machine-guns taken; the French armies had lost, April 16-25, 15,000 dead, 60,000 wounded and 20,000 missing. On the whole front of attack the advance was carried far enough to force the enemy to reconstruct his battle-line on an 80-km. front; important positions remained in the hands of the Allies: the Vimy crest, the Laffaux mill, the fort of Condé, the Chemin des Dames, and the Moronvilliers massif. Railways of great strategic value were fired. If to these gains be added those resulting from the withdrawal in March, obtained by the mere threat of attack, the first months of 1917 represented for the Entente a total of very valuable successes.

The total of German losses had not been made known, but it can be estimated approximately by basing it on the number of divisions which were engaged on the attacking front. On April 1 43 divisions were in reserve in rear; nine were en route for the French front, two coming from the eastern front and seven being newly constituted. The German armies had therefore 52 divisions available. On April 22 this figure was reduced to 16; on April 25 to 12; on May 4 all their divisions had been engaged. It was necessary to draw on the quiet sectors in order to maintain the battle. At first, divisions withdrawn from the front could, before returning to the line, take a few days' rest and refit. This soon became impossible. This wear and tear increased to an unbelievable extent; the remnants of troops withdrawn were thrown, without transition, on the Argonne front or on the heights of the Meuse. The 11th Guards Div., for example, cut to pieces from May 5 to 10 on the Californian plateau, was identified on May 18 in the Argonne; and the 28th Div., relieved on the 18th, was identified in front of Verdun on the 28th. These divisions' only rest was during the time of their displacement. The same statements are made as concerns the English front; all goes to confirm the extreme wear and tear of the German army.

On May 25, 99 divisions had already appeared on the front, amongst which 11 had appeared twice; there had been as well 110 divisional movements. But now the number of German divisions which took part in the battle of Verdun in 1916 was 43 in 10 months; in 31 months 137 divisions had fought on the Somme. In 1917 the wear and tear was thus treble.

It is quite true that Gen. Nivelle had not obtained that breakthrough which he had hoped for, but thanks to the length and vigour of the attack the exhaustion of the enemy was very near to attainment. The Allies were in a position to profit by this, because, at the moment when the German reserves were entirely used up, 30 divisions remained intact on the side of the Entente: 16 French and 14 British. As the Germans had a total of 150 divisions on the Anglo-French front, as against 178 Anglo-French divisions, the system of reliefs was much more favourable for the Allies. One can understand then why the British Government and High Command insisted on the continuation of the attack.

But were the French troops in a state to repair their losses and to continue the offensive?

On April 1 1917 the French armies on the front consisted of 2,000,000 men, a figure which had never been reached before. In order to keep up this figure the 1918 class was available, and those that had not been called up from the preceding classes, which might be put down at a total of over 300,000 men for the coming year. Besides, during that very year, after the release began from all the war factories, more than 700,000 men were taken from the front for work in the interior in spite of the protests of Gen. Nivelle, and later of his successor Gen. Pétain, who, in order to arrest this excursion to demobilization, had to threaten his resignation. The suspension of the offensive was inexcusable.
Ludendorff confesses now his qualms: “Our consumption of troops and of munition had been extraordinarily high. We were not able to foresee what would result from the fighting or what efforts we should be called upon to make.” He attributes his safety in the spring to Russian inaction during the Franco-British attack, and in the summer to French inaction. “As I reflect, and imagine that the Russian success had been gained in April to May instead of in July, I do not believe that the German Army could have been able to remain master of the situation. . . .

The Russian offensive came too late, in July, two or three months after the beginning of the Franco-British offensive; there was no concerted Allied action, as in autumn 1916; each went his own way and we were able, acting as we were on interior lines, to repulse and defeat separately our adversaries who were not working in conjunction.” And, in fact, six German divisions were taken from the French front in June 1917, which contributed to a large extent in stopping Brussilov’s offensive. It is true that the French Government was not in a position to cause the Russian army to act; however, the continuation of the offensive would have produced the same effect in using up the German forces, and it is, moreover, quite certain that it was possible to attack again in July the German front, weakened as it was by these previous deductions, and, in consequence, to arrive at the final result foreseen by Ludendorff. In May 1917 the German army was in a condition which only occurred again in Aug. 1918; but then the Entente knew how to profit by it.

The French Government had in their service at Rechczyz, near Belfort, a most perspicacious intelligence agency, under the direction of Gen. Foch, which being as it was on the borders of Switzerland and Alsace-Lorraine made use of the most varied sources of information. This information, now published, testifies to the great anxiety of public opinion in Germany. M. André Hallays, who was stationed there, thus expresses himself: “On reading the German newspapers of the latter half of April it is impossible to make any mistake; behind the line everyone had then the feeling that the armies had just suffered a series of heavy set-backs before Arras and on the Aisne. Whilst at home a wave of pessimism swept over the country and the madness of certain politicians pervaded the Government, the press and the public; whilst false-rumour multiplied, exaggerating the importance of our losses and the seriousness of certain mutinies, exerted themselves to give to France the impression of defeat—whilst this was going on the German staff found itself obliged to multiply reports and comments in order to reassure the dismayed Germans.” These attacks had come as a terrible surprise to them. When the strategic withdrawal took place had it not been promised that “tremendous events” would result from that “stroke of genius”? Had it not been inferred that the areas so carefully devastated would become the theatre of a new offensive? And now it is the armies of the Entente who assault the German positions, capture thousands of prisoners and threaten new positions! In vain the communiqués sang of victory; in vain the military critics announced that, thanks to “an elastic withdrawal,” the High Command had saved the blood of the soldier, that the attempt to break through had failed, that the communiqués of the Entente were a tissue of lies, and finally that Hindenburg and Ludendorff knew how to husband reserves and to retain the initiative.

Public opinion, preoccupied by strikes, remained insensible to these consolations, and was only struck with the enormity of the losses. From May 1, after the threat of revolution was definitely dispelled, news coming from France was read with more attention. Extracts from Paris papers were telegraphed by agencies, the accounts of debates in the French Parliament were noted; the enemy himself was proclaiming his defeat. The press bureau hastened to take advantage of the innumerable signs that the adversary showed of his discouragement. They persuaded Germany that she had just gained “a great defensive victory.” Thus they succeeded in wiping out the disastrous impression which prevailed after the battles of the Aisne and in Champagne; nevertheless a “defensive victory” was not what the people expected; success of this nature did not bring the date of peace any nearer.

The French Government, however, shut its eyes to information which contradicted its preconceived opinion, whether it came from the French or British staffs, from the British Government, from French agents abroad or from the German newspapers. French public opinion, left without information or guidance, was more and more worked upon by enemy agents. “Reason stalks freely abroad,” said M. Galli in a report to the military commission of the Chamber; from the lodges of the Champagne; from the anterooms of ministers, the most foreboding rumours of discouragement oozed forth.” Scapegoats were sought for; on the 27th, on this same commission, the French Minister of War was called upon to censure Gen. Mangin, around whose name had been conjured a very tenuous of lies which a few months later had to be refuted by those of his colleagues who had arrived at unjustifiable conclusions. Yielding to pressure, which he believed at the time to be irresistible, the French commander-in-chief asked the Minister of War verbally that Gen. Mangin might be relieved of his command. The French council of ministers, taken unawares, the Minister of War before any report or written request had been made, agreed to this on the 29th. and it was quite useless that M. Painlevé became convinced that very evening that none of the charges brought against the general commanding the VI. Army could be justified. A later correspondence conducted between the commander-in-chief and the Minister of War cleared the position of Gen. Mangin.

The authority of the commander-in-chief had not ceased to be diminished after the arrival of M. Painlevé at the Ministry of War. This authority, impaired by the conferences of ministers with the army group commanders, further shaken by the conference at Compiègne on April 6, the echoes of which still resounded, had been killed by the way in which the functions of the chief of the general staff were exercised, functions delegated to Gen. Pétain, who, moreover, had been selected with his assent. The commander-in-chief was unable to order an attack, however small it might be, without being compelled to submit all the details to a general who had openly found fault with all his operations and who appeared to be his successor designate. The crisis concerning the command had been no secret for a long time, but it was on May 9 that the President of the Council announced it to the military the Minister of the Senate; the following day, at the French War Cabinet, the Minister of War asked Gen. Nivelle to offer his resignation under any protest which he liked to choose. Considering that a change in the French High Command would be regarded by the enemy as a confession of defeat Gen. Nivelle refused to hand in his resignation, and hesitation on the part of the Government lasted several days. The threat, however, of resignation by the Minister of War and the attitude of the President of the Council determined the council of ministers to relieve him on May 15 by appointing Gen. Pétain. General Foch succeeded as chief of the general staff.

The Battle of Madametz, Oct. 23-29 1917. Evacuation of the Chemin des Dames by the Germans, Nov. 2 1917.—The hesitations which had succeeded the offensive of April 16 on the Chemin des Dames had cost the French much more dearly than the offensive itself. The German line formed a right-angled salient at the Laffaux mill—and the safety of the position to the S. of the Alleto depended on its possession—for which the two combatants had so hotly contested in May. The battle had slackened in intensity in June and gradually died away in July. Called upon to prepare an offensive with limited objectives at this front, Gen. Maistre, commanding the VI. French Army, had fully realised, since June, that his advance to the Alleto would render the whole position on the Chemin des Dames untenable to the Germans, and he had proved the advantages which the enveloping line continued to offer to the attack on this sector of the front. Ludendorff tells us in his War Recollections that the same thought had occurred to him and he had thought of withdrawal, but Gen. von Bochen, commanding the VII. Army, was certain that he would be able to repulse any attack; when, towards the middle of April, indications of attack were evident, he asked for two reinforcing divisions and additional artillery; after having received this help he believed himself to be absolutely certain of
success. His effects had now been brought up to eight divisions on this sector of the front, where the deep coves and concreted shelters and the undulation of the ground offered enormous strength to the defence. General Maistre, on the 12 km. of the attack front, between Mosny farm and La Raque, had in position three army corps in the formation of a square, two divisions in the first line and two in the second: from left to right, the XIV. Corps under Marjoulat; the XXI. under Degoutte and the XI. under Maud'huy; elements of the XXXIX. Corps under Deligny had to support the attack on the right. One thousand eight hundred guns were at his disposal: 900 of 75 mm., 850 heavy guns and 50 long-range or large-calibre guns, besides 460 trench guns. Never before had such a mass of artillery thund- ered on such a narrow front. The long-range guns were placed on the flanks where they could take a large portion of the German line in rear; the field artillery had been pushed up close to the parallel lines of assault in order to be able to support the attack as long as possible. The artillery preparation lasted for six days and completely disorganized the German position. The heavy shells reduced to shambles a number of prepared underground caves. On Oct. 23 at 5:15 a.m., in darkness and in foggy and cold weather, the attack began.

The XIV. Corps under Marjoulat, attacking from W. to E. towards Alleman, seized at one bound the two lines of trenches which constituted the first position, and then captured the village of Alleman, after having surrounded it; the tanks assisted them to reach the second position and a turning movement brought the corps in position facing north. On its right, the XXI. Corps under Degoutte, by an unimpeded advance, captured the two German positions together with the village of Vaudesson and even that of Chavignon, where it found itself in position in line.

The XI. Corps under Maud'huy supported its right; the 38th Div. under Guyot de Salins (which had captured Fort Douaumont on Oct. 24 1916) had the honour of seizing Fort Malmaison and from thence advanced up to Voyeu-Chavignon. The 66th Chasseur Div. was less fortunate, and overlooked Pargny-Filain, which still remained in the hands of the enemy.

During Oct. 24 and 25 the advance continued and reached the Ailette as far as Chavignon. But it was only on Oct. 26 that victory was complete on the right, thanks to the inter- vention of the XXXIX. Corps under Deligny.

The Chemin des Dames was taken in flank and in rear; a relief division, caught by the French artillery, had not been able to come up, and supply had become impossible. During the night Nov. 1-2 the Germans were compelled to evacuate it. "Our losses had been very severe," said Ludendorf, "some divisions had been cut to pieces." For himself, he was in- different whether he was on the N. or the S. bank of the Ailette; but he himself was more objectionable for the Chemin des Dames I suffered a gun in giving the order to abandon it, but we would have suffered losses incessantly if we had wished to stay on there."

This great victory, obtained with relatively small losses, was emphasized by the capture of 11,157 prisoners, 200 heavy guns, 223 trench mortars, and 720 machine-guns. For its careful preparation, clever handling and happy consequence, it will remain as a model of an offensive with limited objectives. (C. M. E. M.)

V. BATTLE OF SOISSONS-REIMS, MAY-JUNE 1918

From the outset the aim of the main German offensive in 1918 had been to break the spirit of the opponents of Germany by numerous blows in the quickest possible succession and to dispose them towards peace. If, therefore, the German Supreme Command wished to retain the initiative, the first great blow must be followed, as rapidly as the transport of the powerful weapons of attack permitted, by a second blow. In itself, the most favourable course would have been to continue the attack against the English front at Ypres and Baillulieu. But here such strong English and French reserves had been posted ready in the meantime that the attack would have to be delayed in the strong Allied resistance. Similar conditions obtained on the neighbouring German attacking front farther to the south. Before the front of the VII. and I. Armies, on the other hand, the Allies, relying on the difficulties presented to the attack by the strong positions on the heights of the Chemin des Dames, accessible only with difficulty, had weakened their forces, having sent to Flanders a large proportion of the fit and rested French divisions stationed here in exchange for French and English divisions worn out with fighting there and in need of rest. The dispositions of the Allied forces suggested that they expected a continuation of the German offensive on the front between the North Sea and the Oise, since by far the greater part of their reserves were held in readiness there, to the considerable weakening of other fronts, notably before the German VII. and I. Armies, facing whose inner wings were stationed three war-worn English divisions. So the choice of front of attack and the battle-ground fell on the oft-contested chain of hills between the Ailette and the Aisne, the Chemin des Dames.

The Battlefeld.—The tract of land between Reims and the great wooded districts of Compiègne and Villers-Cotterêts is divided by the different tributaries of the Seine and the Oise, running from E. to W. into several parallel strips. The most northerly of these strips is a pronounced ridge with steep declivities northwards to the Ailette and southward to the Aisne; along its summit runs the Chemin des Dames leading from Craonne to the Laon-Soissons road. These heights afford an uninterrupted view far over the country lying to the north. In this direction lies the tactical significance of the Chemin des Dames, for the sake of which so many heavy engagements had already been fought. Since the Chemin des Dames had been in French occupation, Laon with its important railway centre lay under their fire. South of the Aisne lies a second ridge, bounded on the S. by the Vesle. On the left bank of the Vesle rises the third strip consisting of the wide hill country which descends on the S. to the spacious valley of the Marne.

The Allied Position.—The French position ran along the Chemin des Dames, and farther eastward into the valley. In front of this position the Alleman in whose valley the listen- ing posts of both sides were close to one another. The French positions were not only of great natural strength by reason of their favourable situation, but were also just here particularly strongly fortified by every technical device. The French also had at their disposal a numerous artillery of all calibres. The German attack on these positions was therefore to be regarded as a bold attempt, whose only prospect of success was in effecting a surprise on the French and English and in keeping secret from them the preparations for attack, especially the advance of the artillery.

Dispositions for the German Attack.—The German Supreme Command had decided, on the basis of a plan of attack proposed by the army group under the Crown Prince as early as the end of April, to attack with the VII. and I. Armies from the district south-westward of Laon—southernly of Berry-au-Bac in the direction Soissons-Fismes-Reims. If this attack proceeded favourably it was to be prolonged on the right over the Ailette to the Oise and on the left as far as Reims. Simultaneously an attack by the XVIII. Army was to be prepared westwards of the Oise with its centre of gravity in the direction of Compiègne. The German Supreme Command hoped that the push southward would succeed in reaching the neighbourhood of Soissons and Fismes, and by this means attract strong forces from Flanders, so that it might be possible to continue the attack there according to plan. The army group under the Crown Prince Rupprecht was to remain purely on the defensive. On this front, as on other sections of the western front where attack was not intended, feigned preparations for attack were to be made.

Preparations began about the middle of May. The VII. Army under Gen. von Böhm was charged with the main Ger- man attack across the Chemin des Dames, the I. Army under Gen. Fitz von der Schulenburg for the neighboring Laon to the left, and the XVIII. Army under Gen. von Huth the at-
tack in the direction of Compiègne. The right wing of the main attack, LIV. Corps and VIII. Reserve Corps, had the task of pushing forward in a south-westerly direction on both sides of Soissons, after taking possession of the plateau W. of Neuville-sur-Margival and the heights of Jouy and Osteil. The XXV. Reserve Corps was to make its way on both sides of Cerny-en-Laonnais direct towards Braine and on the E. to take as much country as possible towards the S.; the IV. Reserve Corps was to attack the "Winterburg" (i.e. the height at the extreme western limit on the Chemin Dames, immediately N. of Cramoie) with the main force and advance farther in the general direction of Fismes; in concert with this on the left the LXV. Corps, especially charged with the attack on the hills N. of Pontavert, was to occupy with its left wing the river bend N. of Berry-au-Bac.

Of the I. Army at first only the XV. Army Corps, advancing simultaneously with the VII. Army, was to throw the opposing forces over the Aisne-Marne canal. The corps was to provide itself with bridgeheads in order to take the heights of Cormicy if the attack of the VII. Army proceeded favourably.

A further attack to the right of the main attack was prepared by the VII. Corps of the VII. Army, which with its centre of gravity on both sides of Guny was to push forward over the Ailette, making its way in a south-westerly direction towards the Oise. This enterprise was not, however, possible until a few days after the beginning of the main attack, since its execution demanded that a section of the artillery used in the centre of the VII. Army should be moved to that position. The total number of divisions taking part in the attack was 41. The whole attack between the Oise and Reims was indeed planned on a wide front, but its aims were limited.

Measures for Securing Secrecy.—The whole success of the undertaking depended on the element of surprise. It was all the more necessary to pay the most careful attention to the measures for the disguising and concealment of the attack as good flying weather and dominating observation posts favoured the enemy's intelligence service. It was necessary to over-run the Chemin des Dames at the first onset, before the local reserves could come into action. The fundamental principle laid down was that the preparation for attack should involve no change of any kind in the landscape. The reconstruction of battery positions, roads, camps or shelters must be reduced to the minimum. The advance must be completely under cover and in the airmen's photographs. The German fighting aircraft continually watched the ground of the front of attack, rail and road traffic, telephone, wireless and postal services receiving the closest attention. All assemblage of troops behind the new front of attack had to be effected with the utmost caution and generally only at night. Every troop, every column, entering the region under the command of the attacking armies received a sheet of instructions in which all the measures necessary for secrecy were again expressly pointed out. There was to be no visible sign of the increase of the number of men bivouacked in any particular place. All transport was to be concealed under trees and irregularly placed. On the appearance of enemy airmen the roads must be empty of troops. No smoke from new positions was to be permitted by day, and at night bright fireslight was to be avoided. Guides familiar with the locality were allotted to reconnoitring staffs, so that they might not make mistakes through ignorance of the country. In day-time road traffic was not to exceed its ordinary quantity. All movements for the advance, especially of battery reinforcements and munitions, were to take place only under cover of darkness. The greatest stress was laid on reducing the danger of transport in moving up batteries on the front. The divisions for the attack were designated as the division of the engineers, the division of the royal artillery and the division of the infantry.

Army Preparations.—The main difficulties of an infantry attack against the immensely strong positions on the heights of the Chemin des Dames were clearly realized. The ascent of the steep slopes was only possible if the German artillery had succeeded in silencing the greater part of the opposing artillery. Therefore, the greatest attention must be given to the artillery preparation. Col. Bruchmüller, whose capacity had already proved in the earlier offensive, was entrusted with this.

The ground over which the artillery was to advance consisted of the depressions N. of the heights N. of the Ailette and the valley running up to the Chemin des Dames and partly overlooked by him. The preparations for the artillery advance were carried out by the divisions in line, the corps staffs entrusted with the attack moving up early enough to be able to direct these preparations. The orders given for the artillery advance were so complete in every detail that a perfect coordination of the whole body of artillery was thoroughly ensured. The infantry had to be firmly convinced that their business in the attack would be substantially eased by the annihilating effect of their own artillery. The numbers of the artillery provided by the Supreme Army Command proved on the whole sufficient.

The employment of the artillery was based on a calculation of the number of batteries, and the kind and calibre of gun required. The re-enforcing batteries and columns were brought up this time for the most part by rail, contrary to the practice in the March offensive. Transport arrived from the whole front; the batteries were in most instances placed, to begin with, behind the ground on which the advance was to take place and beyond the zone of the enemy fire. Extraordinary caution was observed during the advance of batteries pushed up far to the front. The unnoticed advance of the foremost batteries was most effective in the morning on the slope of the Ailette valley as it effectively drowned the noise of transport. In the placing of artillery care had especially to be taken that the shelter of the barrage was assured to the infantry, not only over the summit of the ridge of the Chemin des Dames but over its southern spurs during the descent to the Aisne. For this purpose an exceptionally bold disposition of the batteries was necessary. The mass of the artillery had to be pushed unusually far forward. Hundreds of batteries were brought into position, thickly massed in some parts, almost directly behind the foremost line of infantry. The unexpectedly great success of the attack was largely due to this exceeding boldness and disposition of artillery. Single pieces of the heaviest guns with flat trajectory were also pushed far forward, almost into the line of the other batteries, so as to be able to bring under fire the detraining railway stations lying far behind the enemy line and the quarters of the higher staffs.

In contrast to the procedure in the former attack all registration was to be abandoned, in order to surprise the enemy as completely as possible. Effective bombardment was to begin immediately; and the first object was to be a thorough gassing of the positions right down into the Aisne valley. The bombardment was divided into three phases. The first consisted in a general surprise artillery attack against infantry positions, batteries, mine-throwers, command posts, central telephone stations, camps, and headquarters, with all batteries and as far as practicable with gas munitions. The second phase was directed to an intensified action against artillery, for which purpose the field batteries attached to the infantry were also drawn in, in order to put the opposing batteries out of action at as early a stage as possible. The third phase was directed especially against infantry and artillery positions and targets in the distant rear of the line of battle. The second phase was the attack before dawn, moreover, offered substantial advantages for the success of the infantry attack and its exploitation, for which the whole light day was thus made available.
During the infantry attack the principal task of the artillery was to protect the storming infantry while keeping down the opposing artillery fire, to protect the assaulting infantry by barrage advancing in front of them, as well as by fire of the guns accompanying them. After the infantry attack, owing to the experience gained in former offensives, only so many batteries were to be brought forward as could certainly be sufficiently supplied with enough munitions. Provision was also made to meet the great difficulties which the steep ascent on the S. bank of the Aisne presented to the artillery, by preparing men and material for the building of roads. All these measures demanded the most meticulous care for every detail, and it was vital that nothing should be forgotten. The placing in position of the attacking divisions and the artillery groups, with all the other preparations, was completed by the evening of the 26th. The beginning of the attack was fixed for May 27.

The Artillery Battle.—In the night of May 26–27 punctually at 2 a.m. the German artillery bombardment suddenly began, completely surprising the French and English. This went successfully from the start. The whole valley of the Ailette, the steep slopes of the Chemin des Dames, the Chemin des Dames itself, and the country lying far behind down to the Aisne, were in a short time thoroughly gassed, so that, as was later ascertained, a great part of the gassers left their batteries in panic at the beginning of the bombardment, and many pieces were destroyed at the very beginning by direct hits. In the first ten minutes observers announced numerous munition fires in the battery positions and ammunition dumps of the opposing armies. The fire against infantry and artillery positions was also well directed. Thanks to the powerful effect of the superior strength of the German artillery it was already clear, after an hour and a half’s bombardment, that the opposing infantry and artillery were sufficiently subdued to enable the German infantry to venture the assault.

The Infantry Attack.—Punctually at 4.30 a.m., while it was still quite dark, the German infantry advanced to the attack. Without difficulty or delay they crossed the Ailette valley which was covered with bushes in some places and marshy in others; during the ascent to the Chemin des Dames serious infantry fights only developed at Chavignon, Pargny and Fillain; on the other sections of the front the German infantry pushed forward almost without resistance on to the heights of the Chemin des Dames. Here the remarkable effect of the artillery preparations was already apparent: the steep slopes had been surmounted, and the first lines were taken almost without firing a shot. The rising sun saw the first files of prisoners descending into the Ailette valley. The procedure adopted in previous attacks by the infantry had also stood the test on this occasion. There were no innovations in infantry tactics. By 7 a.m. the I. Army had already reached the canal, the objective of their attack, and part had crossed it. Since they were to await the left wing of the VII. Army before further advance, a halt had to be made there according to orders. Thus the opposing army gained time to reform their units and to rally with strength of the VII. Army were overrun by the advance of the attacking divisions so long as they felt the effect of overwhelming German artillery fire. This was an essential difference between the attack of the I. and VII. Army, and was to be of decisive importance.

By 9 a.m. the German infantry, after breaking through the whole enemy system, had reached the line Vauxaillon–Jouy-Pontavert–Berry-au-Bac; on rapidly built roads, accompanying batteries and mine-thowers had also reached the heights of the Chemin des Dames and followed close on the heels of the infantry. Numerous aeroplanes attached to the infantry and artillery accompanied their advance over and before their fronts, while the battleplanes in repeated flights helped to break recurring resistance.

The Passage of the Aisne.—The farther advance from the heights of the Chemin des Dames against the Aisne became a regular race between the divisions of the VIII., XXXV., and IV. Reserve Corps and the LXXV. Corps. Without waiting for fresh orders each division, taking advantage of the successful surprise over their opponents, had on its own initiative pressed forward without halting. Soon after 11 a.m. the first German companies crossed over to the southern bank of the Aisne on bridges mostly intact. A vast and unexpected success had been gained. A wide and apparently impassable stretch of country, which had been for years the scene of the heaviest fighting, had been captured within a few hours after a short artillery preparation. Of the divisions of the defenders two English and three French had already had to evacuate. The survivors streamed into the prisoners’ collecting stations. The captured guns stood abandoned in their positions, some of them undamaged.

In the afternoon and evening the attack on the principal fighting front of the VII. Army went forward without a pause farther in the direction of the Vesle valley. Engineering and road-making troops worked with the utmost effort to level a path for the columns following through the enemy positions and over the steep way up to and down from the Chemin des Dames.

On the two wings the advance was considerably slower; on the right, before the front of the IV. Corps S. of Vauxaillon, and at Laffaux, the Command had not recognized so quickly the favourable nature of the situation, and had not advanced with such unsparking vigour as in the centre; otherwise Soissons would probably have fallen on May 27 and at latest on the 28th, and the French, before they could have organized themselves for resistance, would have been compelled to evacuate all of the ground lying between the Oise and the Aisne. Here, just as before the front of the I. Army on the heights of Cormicy and farther E., the French had time to take up a position and to rally for fresh resistance, so that the infantry engagements became gradually more and more severe. The machine-guns had to be taken one by one, and here and there the enemy artillery again became active. The VII. Reserve Corps also could only take Vailly after heavy fighting. Here again rich booty in guns fell into German hands, among which were the railway guns, famous for their bombardment of Laon, which had been injured by the German long-distance guns and their withdrawal thus delayed.

The Vesle was reached by the XXV. and IV. Reserve Corps, and in the darkness sections of the XXV. Reserve Corps passed southwards of Courcelles and Paars, while sections of the IV. Reserve Corps occupied the steep slopes at Fismes and Magnieux. On this very first day of fighting the Germans had obtained the front of about 40 km. to a depth of about 20 km. Over 15,000 prisoners and immeasurable army supplies had been taken. The German losses were proportionately small.

The second day of the battle, May 28, saw the first violent counter-attack of the opposing army against the right flank of the German attacking troops. The attempt was made in this to prevent a further widening of the breach on either side, and the first available reserves were flung against the German wings, divisions being hurried up by rail, motor and boat, in order to arrest and throw off the German thrust. Nevertheless the speed of the German advance was not lessened on this day. The IV. Corps after repulsing French counter-attacks, captured the heights N. and N.E. of Soissons. On the left the German divisions pressed forward until midday, over the whole sector of the Vesle, from Missey on the Aisne by way of Lhuy-Courville on the Ardre as far as the northwestern fort of Reims. The objective was thus reached after a day and a half’s fighting. But in the ardour of the pursuit the troops stormed on without orders, though in agreement with the intentions of the higher command, in order to improve their success by determined pursuit. The order given by the Supreme Army Command at noon of the 28th to continue the attack as far as the line of heights S.W. of Soissons–Fère-en-Tardenois–the heights S. of Coulonge, reached the troops when they were already storming forwards. On the right wing of the VII. Army, the VII. Corps had already joined the attack on May 28 without waiting for the completion of the preparations begun at this point. Here, however, the resistance was so
obstinate that it was only in the course of May 29 that the dominating heights at Crecy-au-Mont were captured.

On the following days the VII. Army pushed forward with its centre in a southern direction as far as the Marne. The right wing of the I. Army, which had extended the attack towards Reims on the left, pressed forward between the Marne and the Vesle against the wooded hills of Reims, but soon met here with unconquerable resistance, as strong French reserves had been placed on this front. The right wing of the VII. Army took Soissons, and between the Aisne and the Marne gained ground towards the heights S.W. of Soissons, and up to the eastern edge of the wood in Villers-Cotterêts.

On May 30, a new attempt was made to extend the road and rail centre of Soissons as well as of Fère-en-Tardenois was of tactical importance. In both places immense masses of material fell into the hands of the Germans, especially in the wooded country at Fère-en-Tardenois, where they captured a vast dump of French and American munitions, pioneer and transport material, which the French had not succeeded in removing in time in spite of a violent counter-attack. On the left wing on this day Reims, against the N.E. front of which the VII. Reserve Corps of the I. Army had advanced to the attack, was so surrounded with the German troops that all the roads and railways leading from Reims to the Marne lay under German fire. On May 30 violent counter-threats by the French had held up the advance of the German right wing, while the German centre in a rapid advance had by midday reached the heights of the northern bank of the Marne between Château-Thierry and Dormans, on the possession of which the use of the important stretch of rail Paris–Epernay–Châlons depended. On both days the pursuing German troops had passed beyond the objectives fixed by the Supreme Army Command, so that they reached the Marne earlier than it had been thought possible. A further advance of the centre, pushed out southward like a wedge beyond the Marne seemed to involve great risk so long as the German wings on the E. and W. had not won further ground and so broadened the base of attack.

On May 31 instructions went out from the Supreme Army Command not to penetrate farther S. over the Marne, but to extend the successes against the wooded heights of Reims and up the Marne towards the W. in the direction of Villers-Cotterêts, so as to ensure above all the secure use of the railway line leading E. of Soissons from the Aisne to the Vesle valley, and to be able to give effective tactical support to the later attack by the XVIII. Army over the Montdidier–Noyon line, for which plans had been made.

On May 30 and 31, and particularly in the first days of June, strong counter-attacks were made by the French, with the strong reserves assembled in the district S.W. of Reims and S.W. of Soissons, plainly with the intention of pressing in the flanks of the German advance. All these attacks were nevertheless bloodily repulsed, as were the American attacks a few days later against Château-Thierry, which had fallen into the hands of the Germans on the 31st.

In the first days of June the fighting became steadily more severe, as the Allied resistance, reinforced by an uninterrupted flow of fresh divisions, grew more obstinate and the counter-attacks progressively more violent and extended. The Germans therefore succeeded in gaining only little ground. The powerful impetus of the German attack had come to an end.

According to orders sent on June 7 from the Supreme Army Command, the VII. Army was, indeed, to continue to press forward slowly on both sides of the Aisne, but was otherwise to stand on the defensive; the I. Army was only to carry the attack farther where a gain of ground seemed necessary to reach a tactically more favourable position. The following days saw a series of local engagements extremely costly for the French, in which individual places, heights and tracts of ground changed hands many times without yielding definite success. On June 17 the German armies stood with their right wing and centre roughly on the line Noyon–Fontenoy, the eastern edge of the forest of Villers-Cotterêts, Château-Thierry, and up the Marne to Verneuil; the left wing had penetrated to the outlying woods W. of the wooded heights of Reims, and close to the W. N. and E. front of Reims, which was closely encircled. In view of the unexpectedly rapid advance of the centre of the VII. Army the strategic situation was unfavourably affected by the fact that the capture of Reims had not been effected; this made difficult the bringing up of drafts for the sections of the VII. Army pushed forward to the Marne, because of the need of sufficient railways.

The tactical result of the battle of Soissons–Reims for the Germans was great beyond all expectation. Over 65,000 prisoners fell into their hands. The booty included about 700 guns and lacking munitions. In addition the French and Allied losses in matériel were enormous. The success was due primarily to the spirited attack of the infantry, the equally brilliant preparation and execution of the artillery attack and the complete surprise of the French and English. By the very clever maintenance of secrecy the French command was so successfully misled that they kept their reserves assembled at the wrong place. Thus it was possible by an attack with narrowly limited aims, carried out by relatively weak forces, to develop an operative success which ended in a substantial weakening of the fighting force of the Allies. Gen. Foch had been compelled to bring up gradually against Reims German forces more than 50 divisions. The German losses on the other hand were small. N. of Reims the exhaustion of force on the French and English side was far greater than on the German.

VI. THE GERMAN OFFENSIVE OF JUNE 15 1918

The preceding German offensives of 1918, the Somme, the Lys and the Aisne–Marne, had left the German army with three salients projected from its main line on the western front, salients costly to hold and dangerous because the means were lacking properly to entrench them and the communications were deficient, both in roads and railways. Particularly was this true of the Marne salient. To push the attack on Amiens was obviously the desirable strategic course, but owing to the difficulty of organizing an attack there, and to the massing of Allied reserves behind that part of the front, it offered little chance of success. Ludendorff consequently turned his attention to pushing forward the Lys attack. But the nature of the terrain and the activity of the British artillery and aviation made the accumulation of the necessary matériel a difficult, slow and costly undertaking. Early in July it had become apparent that Crown Prince Rupprecht could not be ready before August. Something had to be done in the meantime to preserve the initiative. The attack in the Champagne was Ludendorff's solution of the problem. The Allied front in that sector was known to be weakly held. A successful attack there would not only ease the difficulties of communication in the Marne salient but might lead to the evacuation of Verdun, giving the Germans an additional and much-needed railway line for the supply of their armies in France. An additional result hoped for was the withdrawal of Allied reserves from N. to S., facilitating the German attack in Flanders planned for August.

The date set for the attack was July 15, but delays in the preparations defert it to the 15th. The plan called for the VII. German Army to force the crossing of the Marne between Jaulgonne and Verneuil (20 km.), gain the heights S. of the Marne and advance eastward by both banks of the river on Epernay. Fifteen divisions were disposed for the attack on a front of 36 kilometres. The I. and III. German Armies, E. of Reims, were to advance southward on Châlons-sur-Marne, connecting with the VII. Army near Epernay. Their front of attack was 44 km., for which they employed 15 divisions in the front line and 10 in reserve. No attack was to be made about Reims itself since that city was bound to fall if the other attacks succeeded. On the French side the I. and III. German Armies were opposed by the IV. French Army of Gouraud; the VII., in the sector of attack, by the V. Army of Bethelot and the VI. of Degoutte. These French armies consisted in the main of worn or second-class troops but were fairly compactly disposed and were rein-

{\textit{Champagne, Battles in}}
forced, that of Berthelot by one British and two Italian divisions, and those of Gouraud and Degoutte (in the sector attacked) each by an American division. As a factor of strength on the French side it should be noted that Gen. Gouraud had exceptional prestige and influence with his men. In the matter of intelligence service the French staff had learned its lesson from the bitter experience seven weeks before in the surprise attack on the Chemin des Dames. In spite of the utmost endeavour of the Germans to maintain secrecy regarding their preparations for attack, every phase of them was sought out, chiefly through air observation, plotted on maps and carefully studied up to determine the time, place, extent and method of the next German effort. The information thus gained was supplemented by statements of prisoners so completely that not only were the approximate time and place of attack known to the French more than a week in advance, but on the eve of attack even the time of artillery preparation and of infantry assault were learned.

The French plan to meet the attack was to abandon their front lines, leaving in them only small detached posts backed by occasional wired strong points, and to take up a position far enough in rear to be beyond the ready interference of the German artillery, thus causing the superior German artillery to waste its preparatory fire on virtually abandoned trenches and neutralizing its influence on the infantry combat. The execution of this plan in the sector of the IV. Army was greatly favoured by the existence, several kilometres in rear of their front lines, of a complete system of trenches which had been carefully constructed and occupied during preceding years. It was from these rearward trenches that the French had advanced in 1917 to gain their present lines. Thus not only could the army change its position back to them swiftly and secretly, but the Germans could have no means of learning, by direct observation, that such a shift had been made.

The battle began on the 16th shortly after midnight, according to the German plan, with an intensive artillery and trench-mortar fire on the French trenches believed to be occupied. In the IV. Army sector of Gouraud, thanks to his dispositions, little damage was done to the personnel, though the abandoned trenches were mostly wiped out by the gruelling fire. In the other sectors under attack, while the same policy prevailed in theory, there does not appear to have been the same consistency in its execution and some of the Allied troops suffered severe losses. The French counter artillery preparation had begun an hour before midnight, but, owing to the relative weakness of their artillery arm, and the rearward positions taken up by the IV. Army, does not seem to have made its influence felt.

The infantry advance began at 4:15 A.M. In the sector E. of Reims the assaulting troops, preceded by a barrage, walked almost unopposed through the abandoned French position except that the French artillery constantly increased the intensity of its fire. After the German protective barrage had been lifted, to enable the infantry to pass beyond its limits, the real battle began—fresh French infantry in a prepared position well supported by guns, against unsupported German infantry in the open. The Germans tried to bring up some accompanying guns by road, but without success.

As to position it was a drawn battle, but the heavy losses completely discouraged the Germans. During the night they attempted to reorganize their attacking line and arrange artillery support and thereby to renew the assault on the 16th, but the attempt proved abortive, and by noon Ludendorff had ordered its abandonment and directed the troops of the I. and III. Armies to be redispersed for the defensive.

In the VII. Army sector of attack the Marne was successfully forced, and, except in the sector occupied by the American division, the heights on the S. bank were occupied to a depth of 5 kilometres. The direction of attack was then shifted eastward on Epernay, but being beyond the range of effective artillery support from the N. bank, and not being able to get artillery across the river to any material extent, the attack soon slowed down.

North of the Marne the attacking troops soon encountered the deep ravines and rocky, forested heights of the mountain of Reims. Progress was made in the Marne and Ardre valleys; but on the wooded heights, where effective artillery support of advancing troops was impossible, the attack was easily checked. On both banks of the Marne the attack was renewed on the 16th in the direction of Epernay, with resulting slight gains of ground, and again on the 17th without result except increasing heavy losses for the attackers. On the afternoon of the 17th, on orders from German G.H.Q., the VII. Army also passed to the defensive and the battle came to an end.

As an incident of the battle S. of the Marne might be mentioned the defense of the sector S. of Jaulgonne, which has been termed a masterpiece of German trench fighting in the war. The 30th U.S. Infantry, under Col. Butts, had prepared for the attack by building numerous trenches for the German airmen to photograph and for the artillery to register on, and more numerous rifle pits and machine-gun nests carefully camouflaged or concealed. By day the trenches were occupied, by night the rifle pits. The German artillery preparation had wiped out every trench, but the infantry in its pits and nests, despite heavy losses, accounted for more than its numbers in German dead and turned back the attack of a division.

The result of this battle was the beginning of a great moral reversal which was to find its completion in the ensuing counterattack at Soissons. Until the attack of July 15 the Germans had been confident of success. The attack showed them that they could no longer command it. The Allied troops, on the contrary, were buoyed up by the fact that not only had a way been found to stop the German attacks, but that they had been stopped with far lighter losses to the defenders than to the attackers. From a tactical point of view it may be said that the German attack had all the strength and all the weakness of the German war machine. The general staff had invented a stereotyped normal attack which was here applied on the western front for the fourth time, virtually without change of method.

The same artilleryman travelled from front to front, to conduct the artillery battle. Infantry units received identical training. The system produced a powerful onslaught, but killed independent initiative and discarded participation in the planning by subordinate commanders. Its failure in the Champagne may be ascribed to its inherent inapplicability to the situation and to the terrain. German G.H.Q., preoccupied by German internal questions—Russian, Austro-Hungarian and many other problems,—had not the time nor the patience to study out the special requirements of the Champagne problem, nor did it permit subordinates to make the plans. The same rigid point of view speeded the military downfall of Napoleon.

On the Allied side great credit must be given to Gen. Pétain and Gen. Mangin for their skilful measures to foil the German plan after it had become known. The Germans were superior in numbers and, at the start, probably had higher moral. The victory was on the side of superior leadership, both higher and lower.

(A. L. C.)

VII. THE ALLIED OFFENSIVE OF JULY 18 1918

On July 18 1918 the Allies regained the initiative, and the offensive passed to their hands, thereby assuring them of victory. It is generally thought that the aim of the attack carried out on that day by the French X. Army was to clear the front of the IV., V. and VI. Armies, which had been attacked since July 15, and that this had indeed been its first result. Herein lies a double error. At first, the success gained on July 15 by the IV. Army under Gouraud had, by checking the I. and XIII. German Armies, nullified the success of their VII. over the V. Army under Berthelot and Degoutte's VI. Army, a success which, being limited, was dearly bought. Ludendorff informs us that after July 17 he issued orders to those elements which had established themselves on the left bank to recross the Marne; this difficult withdrawal was due to take place on July 20. He gave up the idea of renewing the attack on Reims, which would necessitate the immobilization of powerful forces for a subsidiary venture. Accordingly, he diverted all his strength towards Flanders, where a new offensive on a large scale was
developing. He went personally to Avesnes, where headquarters were, in order to supervise the preparations. The French attack of July 18 had not then as its result the stopping of the German attack. This was, moreover, not the aim of this Allied offensive. There was no question of a counter-attack, but of an operation thought out and prepared for its own ends, independent of the German offensive.

Gen. Mangin had taken over command of the X. Army on July 16 in place of Gen. Maistre. The latter had twice stopped the German advance between the Aisne and the Ourcq, and had, in a small operation on June 15, recovered nearly the whole of the ground lost on the 12th and 13th. It immediately appeared evident to Gen. Mangin that he now found himself in command of the X. Army under conditions similar to those that he had just left on the Méry-Courcelles plateau. Now, in his operation orders of June 20, ordering the counter-attack for the following day at “1000 hours” (11 A.M.), Gen. Mangin concluded with this sentence, which he wished to be communicated to the troops: “To-morrow’s attack should mark the end of the defensive battle which we have been waging during the last two months; it should mark the checking of the Germans, the resumption of the offensive, and lead us to success.”

After having saved Compiègne and stopped the German advance, the counter-attack of Méry-Courcelles had been stopped by the French High Command, owing to lack of available forces, but when Mangin found himself on the W. flank of a pocket of much larger extent, he immediately studied with his staff the question of its reduction, to follow up with an offensive and finally to grasp from the enemy the initiative of the operations. On June 18 he received instructions to examine under what conditions the communications to the S. of Soissons could be disturbed: firstly by aerial bombardment, secondly by a rapid advance from this front, which would enable him to place his heavy batteries in a position which would command the bridges of Soissons and the main exits of the town. On the 20th he sent his estimate of his requirements in infantry and artillery to carry through this operation, from which he foresaw a rapid extension southwards; and he asked the Command to consider how the success could be turned to advantage.

In order to start under good conditions, he suggested a series of minor operations which were intended to improve the positions from which he would attack. Without further delay he started carrying out his scheme, and vigorously pushed forward his preparations on the front of attack. Numerous battery emplacements and ammunition dumps were established.

All the ambulances and clearing stations, which had been placed so far back with excessive caution, were brought forward to within a reasonable distance, which would enable the wounded to be conveyed without injury on the latter’s arrival to the new front. The latter’s arrival on the latter’s arrival, and the opening of the batteries, were given by Minors. Minor operations followed rapidly one after the other on the front of this army, and enabled him to ascertain the degree of exhaustion of the German troops, whose heavy losses had only partially been made good. On June 28 a slightly more important advance considerably improved the situation, and 1,000 prisoners were taken. On the 29th Gen. Mangin received Gen. Pétain’s letter approving of the plan of action, which had already started to be put into execution, and which was agreed to also by the High Command, whose approbation had been obtained through liaison staff officers.

The X. Army’s front likewise was improved to the N. of the Aisne by a minor operation, in which, on July 3, 1,200 prisoners were taken. It was indeed important not to draw the attention of the enemy to the position of probable attack, and it was clear besides that, having attacked eastwards, the X. Army would be called upon to attack in a northerly direction. Gen. Mangin was able to write on July 3: “The minor operations undertaken by the X. Army during the second fortnight of June have been carried out very easily. Without attacking to them more importance than they deserve, the proof can be seen that the enemy experienced the same difficulties as we do in defending himself against troops making use of methods of actual attack. There is ample reason for thinking that an attack carried out on the plateau to the S.W. of Soissons, under conditions which were outlined in the scheme of June 16, would present not only the best chance of success, but could also bring about such a development that would result in the immediate exploitation of the factor of surprise and would lead to the elimination of the Château-Thierry pocket.” The factor of surprise was now quite possible. On the one side the forests made it possible to conceal until the last moment the manoeuvres by which the infantry were placed in position; on the other side the incessant movements of artillery which had taken place during the last three weeks on the X. Army’s front would probably prevent the enemy from noticing the installation of new batteries in the Villers-Cotterêts region. General Mangin asked for the selection and putting in position of all forces necessary to enable him to carry out the intended offensive.

On July 8 a further operation improved the position of the X. Army to the S. of the forest of Villers-Cotterêts. On July 9 Gen. Mangin received a letter from the commander-in-chief approving of his plans. It made no further mention of the elimination of the Château-Thierry pocket, but it said:—“Undoubtedly this operation not only presents the best chance of success, but it can be profitably exploited. Further it constitutes a most efficacious demonstration against the German offensive.” From now onwards it was necessary to prepare for the operation in the greatest detail, in such a way that the concentration of forces and the launching of the attack could succeed one another within a very short time—one days as a maximum. The concentration must be ready to start on July 15.

From July 9-13, the situation continued to improve to the S. of the Villers-Cotterêts forest. The Savière valley, which presented a serious obstacle in that area, was taken. On the 13th, Gen. Mangin, in pointing out these results, declared that these minor operations, which had been carried out at very small cost, had been sufficient to exhaust the five German divisions opposing him. They were replaced by other divisions, which only a short time before had been withdrawn from the front and had not had time to rest or reorganize; their strength having been reduced to 360-50 men per company instead of 150. The enemy was considerably weaker after these reverses; the instructions which were issued to sector commanders, and which were captured, were quite clear:—“Hold on at all costs, without hoping to be reinforced; the bulk of the German army is being kept in reserve for the great offensive.” Accordingly, the situation was favourable for an attack.

The X. Army now consisted of 10 divisions, of which were in the first line, with 750 guns, 530 heavy guns, 132 long-range guns. Except for the latter the means at disposal were inferior to those available for previous offensives, but the force had been doubled within a very short time—four days as a maximum. The enemy was considerably weaker after these reverses; the instructions which were issued to sector commanders, and which were captured, were quite clear:—“Hold on at all costs, without hoping to be reinforced; the bulk of the German army is being kept in reserve for the great offensive.” Accordingly, the situation was favourable for an attack.

The X. Army now consisted of 16 divisions, of which were in the first line, with 750 guns, 530 heavy guns, 132 long-range guns. Except for the latter the means at disposal were inferior to those available for previous offensives, but the force had been doubled within a very short time—four days as a maximum. The enemy was considerably weaker after these reverses; the instructions which were issued to sector commanders, and which were captured, were quite clear:—“Hold on at all costs, without hoping to be reinforced; the bulk of the German army is being kept in reserve for the great offensive.” Accordingly, the situation was favourable for an attack.

On July 15, at “0000 hours” (6 A.M.), important moves of concentration which had been commenced two days previously and were to be carried through on the following days were interrupted by order of the French C-in-C., owing to the German offensive which had just started on the front of Gouraud’s IV. Army. Gen. Foch, however, as he was visiting the headquarters of the army groups, heard of this counter-order and annulled it. The preparations, which had been suspended for some hours, were resumed—but so quietly that the enemy, who had thought up to the 17th that an attack was probable, had meanwhile been completely reassured. “The troops had ceased thinking that an attack would come,” said Ludendorff; “one of my friends, a divisional commander, told me that from the 17th he had been in all the first lines and had gained the impression that profound quiet reigned in the lines of the enemy.”

The Offensive.—On July 18 at “0435 hours” (4:35 A.M.), the X. Army hurled itself against the enemy between the Aisne and the Ourcq on a front of 25 km. without any sort of artillery preparation. Three hundred and twenty-one tanks accompanied the infantry over all places where it was possible to go; they
were preceded by a dense barrage, whilst counter-battery work was vigorously carried out. The Germans were completely surprised. The first lines were thrown into confusion in the twinkling of an eye, exposing the batteries, which were captured. 

An advance of 8 km. was made with particularly brilliant results in the centre, where the 1st and 2nd American Divs. cooperated with Dangan’s Moroccan Div., some of the best storm troops.

On the river N. of the Aisne a little artillery preparation lasting three-quarters of an hour had been found necessary against a strong opposition. The 162nd Div. under Messiny had on their side attacked the objectives which secured the flank of the main attack.

To the S., after a short artillery preparation, the VI. Army under Degoutte had likewise gone forward in a brilliant manner. On the left the rapidity of its advance had assisted the right wing of the X. Army, whose progress had been held up in the dense woods. It attacked without reinforcements, with its divisions in line, and was reinforced gradually by the American divisions which infused a new spirit into the troops and called forth a lively emulation. On the first day, 10,000 prisoners and 200 guns were captured by the X. Army, and 2,000 prisoners and 100 guns by the VI. Army.

Meanwhile Gen. Pétain went with Gen. Fayolle to the post of observation where Gen. Mangin was following the development of the battle. General Pétain considered that the results obtained exceeded his best hopes, but that their exploitation was necessarily limited by the means at his disposal and by the general situation; he took into consideration that the enemy was on the S. bank of the Marne. No more reinforcements could be sent to the X. Army, and from now onwards it had to organize itself in depth in such a way as to be able to maintain itself, relying on its own resources, on the ground conquered. But Gen. Foch, warned by Gen. Mangin, gave orders for the advance to be continued. On the following day the X. Army was informed that four new divisions had arrived, two of which were British divisions taken from the reserves at the disposal of the Allied C-in-C. Gen. Fayolle expressed the same view as Pétain’s to the commander of the VI. Army, but the attack likewise continued on that part of the front.

The struggle continued. The VII. German Army had brought into action its three divisions in reserve, which were promptly reinforced by two more. The Germans recovered, and the struggle became intense. Having been compelled to give up his offensive in Flanders, Ludendorff sent to the Aisne all those divisions given to the Crown Prince of Bavaria. The X. French Army fought over open country against troops at least equal in number to their own and sometimes superior. The American divisions had been withdrawn; some gun crews had asked and obtained permission to prolong their stay with the French troops; they made use of the heavy guns captured from the enemy and they appeared to think it their duty at least to send back the supply of gas shells, which was considerable.

The British divisions came into the battle at the most difficult moment. The 5th Scotch Div., under Gen. Reed, covered itself with glory in the attack on the château and park of Buzancy on July 28. The 34th British Div., partly composed of units which had come back from Palestine and were new to the fighting in France, surpassed all expectations when they took part in the attack on Grand Buzoz on July 29. On Aug. 1 this ridge, which overlooked all the country between the Ourcq and the Vesle, was carried by the X. Army.

The importance of this success was last sight of at headquarters, and on the night of Aug. 1–2 the commander of the group of armies, who was anxious to husband his troops, wrote:—“The X. Army will continue to act on the right in the direction of d’Arcy-St. Restitue on the rest of its front it will maintain a defensive attitude. The forces which are in front of it are obviously of equal strength, and the only chance of making any headway is by dealing a succession of local blows, prepared in detail and always planned according to the capacities of the reduced force at its disposal. These forces will be further reduced when the expected withdrawal of the British divisions takes place.” But the continued pressure on the enemy led to quite another result, and the general commanding the army sent the following telegram which was to be immediately communicated to the troops on the whole front:—“Forward!! The victory of August 1st consummated that of July 18th and has ended in pursuit. The roads are terrible, but if it is raining for us it is also raining for the Boche. Press hard on their heels, hustle them and break through the feeble centers of resistance when they will try to hold up your victorious advance. This evening the X. Army must be on the Vesle.”

At 1100 hours the chasseurs de Villemon’s division entered Soissons. The Aisne, as far as its confluence with the Vesle, and the whole course of the latter river, had been reached by the X. Army on Aug. 3, and by the VI. Army on the 4th. The I. American Corps under Gen. Liggett, which had gradually been brought into action during the battle, had taken an increasingly important part in the operations of the VI. Army, which included as many as six American divisions. The V. Army under Berthelot had attacked under most difficult conditions, as it had reestablished its front after some days’ hard fighting, during which it had been compelled to give way a little; but the American troops had held on to the Reims mountain. Although the V. Army had very difficult ground to cover, it arrived at its objective on the Vesle.

The Results.—Gen. Mangin was able to say thus to his troops:—“You have captured 20,000 prisoners, including 527 officers, 518 guns, 300 minenwerfer, 3,300 machine-guns, parks and ammunition dumps and everything that a large army compelled to retreat precipitately had to leave behind it. You have even taken back from the enemy the depots where he had gathered together the results of his thefts. You have saved from pollution by these civilized barbarians, Soissons, Valois, the whole of the isle of France, the cradle of our nation, with its harvests untouched, and its ancient forests. You have removed from Paris a most presumptuous menace and have given to France the consciousness of victory. You are most worthy of your country.”

From the German point of view, this victory as a first result prevented the proposed offensive in Flanders, the preparations for which had already been started on the 16th. Reserves intended for this offensive had been used up between the Marne and the Vesle, where they had been exhausted to such an extent that their normal reorganization had become impossible. As in every battle said Ludendorff, “the losses have been considerable in the engagements fought since July 18th. The 18th July in particular and the defensive engagements which followed cost us very dearly, although we had been able to recover our wounded, and the number of our men who had been taken prisoner was not great.” (He ignored, however, the number of 30,000 for the X., VI. and V. French Armies). “The losses in the struggle were so important that we decided to break up about 10 divisions, 3 to assign their infantry as reinforcements to the other divisions.”

Ludendorff, who with commendable care kept a record of each operation and especially drew therefrom very wise conclusions, had only been moderately well informed on the last battle. He thought that it had been preceded by a short and heavy artillery preparation and by clouds of gas, all of which was pure imagination; he also pretended to discover a new invention. “Tanks were seen to be used for the transport of troops. They crossed our lines, and after unloading the occupants, who formed nests of machine-guns in our rear, returned to find further reinforcements.” The passenger tank, however, still remained to be found.

The presence of the 1st and 2nd American Divs, which attacked so brilliantly near Viezy and Dommiers, themselves capturing 7,200 prisoners and 21 guns, appeared to have escaped Ludendorff altogether. He had the temerity to write:—“The six American divisions which took part in the battle suffered heavily without obtaining any results.”

Further, the reasons which he gave for giving up the offensive in Flanders were surprisingly indifferent. “The enemy had
every opportunity of being prepared for the offensive. If he
gives us the slip as he did to the east of Reims we would be
unable to obtain a decision. Should he resist, his numerous
reserves were in a position to stop us as on the 10th and 11th of
June in the direction of Compiegne." Ludendorff appeared to
admit that the mere fact of establishing a protective zone in
front of a defensive position made it impregnable. His moral
was affected as seriously as that of his troops. (C. M. E. M.)

VIII. THE ALLIED OFFENSIVE OF AUG. 17-20 1918

Even before the French X. Army had reached the Vesle and
the Aisne, the continuation of the offensive on the N. bank of
the Aisne had been considered. The preparations for this
scheme were taken in hand during the advance of the IV. British
Army under Rawlinson and Dibdeney's I. French Army, which
began on Aug. 8. Marshal Foch thought that the progress of
this offensive would cause the Germans in front of the III.
Army under Humbert to retreat, and then those opposing
Mangin's X. Army. Foch then considered that the two armies
could attack in succession in order to cover the right flank of the
Franco-British advance, thus widening the front of this battle.
In the operation plan of the X. Army it was expected that the
attack would bring them into position along the Oise and the
Aisne, and then, all efforts being concentrated on the right,
the attack, facing E., would ensure egress from Soissons and would
thus be developed in such a way as to outflank the position of the
Chemin des Dames.

The British attack, however, met with steady resistance;
the ground cost them more and more dearly, and was no longer
proporionate to the losses in men. In explaining this state of
affairs to Marshal Foch, Sir Douglas Haig pointed out that he
would provisionally suspend his attack, which had been so
brilliantly started on Aug. 8 to the S. of the Somme, but he
would renew the offensive farther to the N. by two successive
operations, the first of which would start on Aug. 20 against
Arras. Marshal Foch informed Gen. Fayolle, commanding the
group formed by the I., III., and X. French Armies, of the de-
cisions, and asked him when his armies would be ready to renew
their attack. On Aug. 16 Gen. Fayolle, in discussing this matter
with Gen. Mangin, informed him that the I. and III. Armies
were not in a fit state to attack, and that consequently the X.
Army, whose effective were not sufficiently strong to attack
unaided, should content themselves with small local demon-
strations. This was not the opinion of Gen. Mangin, who was
convinced above all of the necessity of continuing the offensive.
He said that the X. Army was ready to attack on the 18th with
11 divisions in the first line and 3 in the second line (3rd, 11th
and 14th Inf. Divs.), but that he proposed to postpone the
operation to the 20th, as the new British attacks were due to
start on that day. He carried his point, though he had not
sufficient artillery at his disposal for this attack: 1,138 guns,
including 324 75-mm. guns, 540 heavy guns, and 274 long-range
guns. This artillery strength, it is true, appeared weak in view
of the extent of the front which had to be attacked, but the
moment had arrived to set a limit to calculations based upon past
experience and to consider the shaken condition of the enemy,
whose power of resistance had very much diminished.

The Offensive.—Before the front of the X. Army the enemy
had his chief line of resistance at a distance of between 2 and 3
km. from the front trenches. This scheme of defence, which
was in accord with the ideas adopted by both sides, had enabled
Gen. Gouraud's army to carry out its magnificent resistance on
July 15th, and the numerous prisoners taken had disclosed all
the details of the scheme.

On Aug. 17 and 18, the divisions in line had seized all the
covering zones, and even gained a footing in a certain part
of the line of resistance, taking over 2,000 prisoners.

From the evening of the 18th to the morning of the 20th, for
36 hours, all the artillery was pushed forward in order to be able
to support the advance of the infantry as long as possible with-
out changing position. In the orders for attack it was laid down
that, after the capture of the two enemy positions, the
infantry should be reformed at the foot of the slopes and should
then push on as far as the banks of the Oise and Ailette. Gen.
Fayolle had not wished that positions should be established in
the valleys, where, as he remarked, trenches in marshy ground
would be difficult to occupy during the winter; but the hour
for such anxieties had evidently gone.

From the 17th, artillery preparations against the second
German position had continued without stop. On the 20th,
at "0710 hours" (7:10 a.m.), X. Army attacked, and all the German
positions were captured. On the 21st, the French came into position against the support divisions which had
been brought up to attempt to reestablish the situation, and on
the 22nd they reached the Oise and the Ailette.

Gen. Mangin said:—"The time has come to shake off the
mud of the trenches." It was so. Ludendorff tells us with
regard to these events that, in spite of all preparations, the battle
had taken an unfavourable turn; the nerves of the German
army were strained; the troops did not everywhere stand against
the heavy artillery fire and the assaults of the tanks. "We
received in this a fresh warning. We had suffered our more
heavy and irreplaceable losses. The 20th August was also a
day of mourning. In truth, it encouraged the enemy to con-
clude his offensive. I calculate that the enemy offensive will con-
continue between the Oise and the Aisne in the direction of Laon.
The direction of the attack was well chosen, as the position of the
XVIII. Army to the N. of the Oise and that of the VII. Army
to the N. of the Vesle should be made untenable thereby. The
enemy maintained a strong pressure against the Soissons-
Chauny line. Very severe engagements were fought here,
marked by cruel alternatives if unsuccessful. One could not
yet say what would be the issue." It is interesting to com-
pare these remarks of Ludendorff with the considerations that
followed Gen. Mangin's in bringing about his attack. These
were:—(1) that the employment of great forces between the
Oise and the Aisne was justified for the reason that this region
would always be the pivot of the manoeuvre; (2) that the
enemy sought to reestablish his position in making use of each
of these lines in succession; (a) the Aisne, (b) the Hindenburg
line (Chemins des Dames), (c) the Ailette, (d) the Serre; and
(3) that the hinge of enemy movement would always be approxi-
mate on the axis Soissons-Laon. Thus it was vital to apply
the maximum force possible in this region in order to smash the
hinge, and to compel successive withdrawals on each wing which
would assume growing importance.

The advance of the X. Army facilitated that of the III. Army
towards the Lassigny massif, and both armies joined up on the
Oise. The X. Army continued to press eastwards between the
Ailette and the Aisne. In spite of a strong resistance the
advance was carried on by successive assaults. On the 30th,
the 32nd American Div. under Gen. Ham captured Juvinoy in
brilliant fashion. During Sept. 4 and 5 the Germans gave up
the Ailette and the Vesle, and retreated to the borders of the
Coucy forest. Between the two it only remained to capture
the Laffaux position which linked them up. The X. Army
only possessed weak efforts in bringing about his attack, and even
in munitions; nevertheless, on Sept. 14 the 1st. Corps under La-
cappe and the XXX. Corps under Penet broke into the Hinden-
burg line on the Laffaux plateau, taking 2,400 prisoners.

The attack developed during the succeeding days, and the
advance continued towards the Chemin des Dames, in spite of
German counter-attacks; it was only stopped on the 20th
upon the order to "organize on the ground taken in such a way
as to hold on to the advantages won and to take every step to
cut down losses and prevent fatigue with a view to be in a
position to pursue the enemy should be retreated.

But the general attack had begun. In the centre of the vast
line, the X. Army: hustled the enemy, who was being a retreat;
it reached the Ailette, and then changing front on the right
threatened the Chemin des Dames to the E.; its right seized
this redoubtable position after having crossed the Aisne; the
Italian Corps under Albricci overcame all obstacles with great
dash and reached the Ailette in its turn. On Oct. 12 the enemy
was surprised in the middle of his preparations for a retreat, which he had intended to carry out the following day. He was hustled without respite along all the front of the X. Army before he had time to complete the destructions which he had prepared. The St. Gobain massif was taken and Laon at last freed. The X. Army advanced 18 km. in 36 hours.

On Oct. 15 Gen. Mangin addressed his troops:—

"You have won the battle of the Ailette. On the N. bank of the Aisne the enemy waited for your attack after your victory at Soissons, and he had withdrawn still farther his line of resistance. On the 17th and 18th you defeated his advanced posts; and then on the 20th, after your strong artillery had been brought up, you defeated him on the field of battle which he had selected himself; you have pursued him beyond the Oise and the Ailette. After the 2oth of August, the struggle became fiercer, the front facing E., for the conquest of those plateau parts which overlooked Soissons. It was necessary to conquer them step by step after having crossed the Aisne and the Ailette by means of force. There you defeated the best divisions of the German army, who exhausted themselves in defending the approaches to the Hindenburg line. On September 14th, the Laffaux mill was carried by assault and the Hindenburg line crumbled right up to the Ailette on an 8-kilometre front. In vain did the enemy, by bloody counter-attacks, attempt to re-take that important position. You have not ceased to advance and have driven him back, compelling him to abandon the line of the Vesle. On October 1st, after you reached the Chemin des Dames, he has been forced to retire, in front of your left, to the Ailette. In the meantime the victorious advance of the Allied armies on your right and on your left threatened the communications of the German armies in position before you and they had to withdraw. You were waiting for this moment; on October 12th, surprising once more the enemy in the very act of moving. With your right and centre you crossed the Ailette, and with your left you seized the borders of the St. Gobain forest, and with a single bound, breaking the resistance of the rear-guards and then hustling them, you have covered 18 kilometres in 36 hours. This was done fighting and in spite of forests and marshes and a most thorough destruction of roads and bridges. You have captured 26,000 prisoners, more than 400 guns and an immense quantity of war material that can never be replaced. Laon, ancient city of communal freedom, and 100,000 French whose joy is for you a wonderful reward, have been freed from the most terrible slavery that has ever weighed upon the human race. The pressure of the adjoining armies has caused the enemy to retire before you; the position which you have just taken forces the enemy to retire before them. Thus the hour of deliverance and justice draws near, with the punishment of the perfidious, shameless thieves, murderers of our wounded, butchers of our women, and children, who must expiate their crimes and build up with their hands the ruins brought about by their insensate ferocity. But you have done nothing since. There remains more for you to do, as the sacred soil of our country is still fouled by the unclean foreigner, as thousands of Frenchmen are still in slavery, and since the world is awaiting its salvation through your courage. Soldiers of Freedom! Forward!"

(C. M. E. M.)

CHANTAVOINE, HENRI (1859-1918), French man of letters (see 5,847*), died at Galuile (Rhône) Aug. 15 1918.

CHAPLIN, HENRY CHAPLIN, 1ST VISCOUNT (1841- ), English statesman (see 5,852), was generally welcomed on his return to the House of Commons in 1907 as a type of parliamantarian fast disappearing. He intervened with effect on questions of land and of social and tariff reform, but otherwise was not so prominent as in past years. As a thoroughly going Tariff Reformer, he deplored the change of policy with regard to food taxes which was forced on the Unionist leaders in the winter of 1912-3. When the first Coalition Government was formed in May 1915, he was left the solitary conspicuous Unionist on the Opposition front bench; and it was felt to be a fitting close of a distinguished career in the Commons when at the age of 75 he was raised on the recommendation of that Government to the peerage in April of the following year.

CHARLES (KARL FRANZ JOSEF) (1887- ), Emperor of Austria and King of Hungary from 1915 to 1918, was born Aug. 17 1887 at Persenbeug in Lower Austria. His father, the Archduke Otto (1865-1906), the younger brother of the Archduke Francis Ferdinand, was a clever man of easy morals; his mother, Princess Maria Josepha of Saxony (1860-1912), was a zealous Catholic. Charles, as early as three years old, was given full charge of the Bohemian garrison towns. At that time no opportunity was given him of gaining a closer insight into affairs of State, although the death of his father in 1906 and the renunciation by his uncle, the Archduke Francis Ferdinand, on the occasion of his marriage with the Countess Chotek, of any right of succession for the children of this union, made him heir presumptive to the Emperor Francis Joseph. In 1911 he represented the Emperor at the coronation of King George V. in London. In October of the same year he was married at Panzore (Italy) to the Princess Zita of Bourbon-Parma. Of this marriage, which is elsewhere described as a happy one, there were several sons and daughters, the eldest of whom, Otto, was born in 1912.

Charles's relations with his great-uncle, the Emperor, were not intimate; and those with his uncle Francis Ferdinand, the heir to the throne, not cordial, the differences between their wives increasing the existing tension between them. For these reasons Charles up to the time of the murder of Francis Ferdinand, obtained no insight into affairs of State, but led the life of a prince not destined for a high political position. It was only after the death of the Archduke Francis Ferdinand that the old Emperor, moved by an innate sense of duty, took steps to tutor his heir to his crown in affairs of State. But the outbreak of the World War interfered with this political education. Charles spent his time during the first phase of the war at headquarters at Teschen, but exercised no military influence.

In the spring of 1916, in connexion with the offensive against Italy, he was entrusted with the command of the XX. Corps, whose affections the heir to the throne won by his affability and friendliness. The offensive, after a successful start, soon came to a standstill. Shortly afterwards Charles went to the eastern front as commander of an army operating against the Russians and Romanians. On Nov. 22, the day of his great-uncle's death, he succeeded to the throne.

Seldom has a ruler on ascending the throne been faced with a more difficult situation. The struggle between the nations had been going on for more than two years; for more than two years the troops of the monarchy had been fighting heroically against the superior forces of their enemies. The military and economic resources of the monarchy were beginning to fail. Behind the front, especially in the towns of Austria, there was want of the necessaries of life, and already it was clear that anti-dynastic feeling was spreading widely especially in the non-Austrian and non-Magyar territories.

His programme on his accession was to combat this feeling, to renew the splendor of the dynasty, to give to the peoples under his rule the longed-for peace, and to bring about a settlement between the different nations composing the Habsburg Monarchy. But how was this programme to be carried out?

The Emperor Charles thought that for this purpose he needed new men; he therefore dismissed many of his predecessor's most influential advisors, and replaced them by persons from his own circle of friends and that of the late Archduke Francis

CHARMES—CHEMISTRY

Ferdinand. The Obersthofmeister, Prince Montenuovo (1854— ), was superseded by the former president of the council of ministers, Prince Conrad Hohenlohe (1863-1920); the position of head of the military chancery, which had been held during the last years of the Emperor Francis Joseph by Freiherr von Bolfras (1838—), was given to Field-Marshall von Marterer (1862—1919); Count Polzer (1870—) succeeded Freiherr von Schiesel (1842—) as head of the civil chancery. The Archduke Frederick, the commander-in-chief, was dismissed, the Emperor himself taking over the supreme command of the army, and headquarters were transferred from Teschen to Baden, near Vienna. Shortly afterwards Conrad von Hützendorf was replaced as chief of the general staff by Arz von Straussensburg. In the great offices of State there was also a change of personnel. The position of the Hungarian prime minister, Stephen Tisza, was indeed much too strong for his removal to be thought of at that time, and this was not effected till May 1917. But the Austrian prime minister, Ernst von Körber, was replaced by Count Clam-Martinitz, and the Austro-Hungarian foreign minister, Baron Burian, by Count Ottokar Czernin. These changes, however, were more on the order not to become the free men, with the exception of Czernin, could not free themselves from the traditional principles of government, while they lacked the experience of their predecessors.

The Emperor Charles himself had not the energy and strength of character necessary to carry out his views. Even his adherents while praising his powerful memory, his gift of rapid comprehension, his marked sense of the greatness of his House, his devotion to duty, and his personal charm, admit that he lacked the stronger qualities. His efforts for peace, which embroiled him with Germany, and his attempts to save the Habsburg Monarchy by concessions to the various nationalities composing it are described in the article AUSTRIAN EMPIRE (Foreign Policy).

During 1918 his attitude became more and more vacillating. Immediately after the capitulation of the Bulgarian army he announced that the various nationalities were free to sever their connexion with the monarchy, but on Oct. 16, in the hope of saving the dynasty, he issued a manifesto forecasting the conversion of Austria into a federal state, but with no mention of Hungary. This project also failed, the revolutionary elements having gained complete control in the various territories, and on Nov. 17 the Emperor, in order not to hinder the free development of his peoples, resigned all share in the government of Austria. Two days later he made a similar renunciation in the case of Hungary. The German Austrian Republic was proclaimed by the National Assembly on Nov. 12; the Hungarian at Budapest on Nov. 16. Yet Charles did not resign the crown of his dominions. He retired to his castle of Eckarotau on the Danube; thence he went on March 24 1919 to Switzerland, where he stayed first at Schloss Gstaad, and later at Frangins. His attempt at the end of March 1921 to secure his restoration as King of Hungary failed owing to the unfriendly attitude of the Hungarians and the unanimous opposition of the Succession States and the Entente. A further and more serious attempt, on Oct. 22—24 1921, was defeated with fatal results to the ex-Emperor’s chances of restoration. Having made a surprise air-flight with his wife from Switzerland to the Burgenland (where for some weeks a revolt had been organized against its transference to Austria), Charles was there joined by a small force of armed Royalists, at whose head he marched on Budapest. But the Allied Powers, as well as the Little Entente, at once made it clear that a coup d'état would not be tolerated; and there was a strong rally at Budapest to the side of the Horthy Government. The Royalists, within 12 m. of Budapest, were met and defeated, with heavy losses, Charles and Zita being themselves arrested at Komorn. On instructions from the Powers, the definite deposition of Charles and renunciation of his claims to the throne were insisted upon, and he and his wife were handed over to the custody of the Allies for internment. With this dramatic failure was ended the hope of a restored Habsburg dynasty in Hungary.

(A. F. Pr.)
CHEMISTRY

matter in a fourth state previously unrecognized (1879). The fundamental character of the discovery was not realized, however, until it was interpreted by Sir J. J. Thomson (1897), after Röntgen (1893) had shown that peculiar pulsations (X-rays) were excited by the impact of the discharge against a solid surface.

From 1852 onwards, the year in which Frankland first made known the simple theory of atomic valency upon which hitherto all structural formulae have been based, chemists spent laborious days in verifying the Deukonian theory of atoms, itself a most wonderful prediction of geniuses. They have been engaged in defining atomic properties and in the comparative study of the elements; also they have been at infinite pains to elucidate molecular structure, in the hope of explaining the properties of compounds generally in terms of such structure. The work done is of colossal proportions. Success was attending their efforts in most directions; and a finished stable system was almost in prospect, when, with little notice, although the storm had long been brewing, their peace of mind was disturbed by the rudest possible intrusion from the side of physics. It is true that a note of warning came through the discovery of the radio-active properties of uranium by Becquerel; but it was not until the high-explosive shell radium was let loose that all preconceived views of atomic sanctity and sanity were scattered to the winds.

Although no one regarded the elements as strictly "elementary"—the only explanation of Mendeleef's generalization was that they were genetically related and therefore of complex structure—it had always been supposed that they were infinitely stable, only to be decomposed, if at all, by resort to extreme measures. In radium, however, an "element" was suddenly found that was ever undergoing disruption and yet it was impossible to control its decay, either to hasten or diminish the rate. Even more marvellous was the character of the change—particularly as illustrating the dependence of molecular idiosyncrasies on structure. Radium is a metallic material, resembling barium; the first weighty product of its slow spontaneous decomposition, together with the inert gas helium, was found to be a highly volatile and inert gas emanation now known as radon (or nitrogen) having none of the properties of a metal; this latter, however, also underwent change and very rapidly, a helium molecule being again obtruded. This downward course was progressively continued, until at last what seemed to be lead was obtained. Radium has been proved to be but a child of uranium, the most weighty of the known primary materials (238), though produced from it at a rate far slower even than that at which radium itself commits suicide. Thorium, the oxide of which plays so great a part as chief component of the "mantle" now generally used for incandescent gas-light, has also been shown to be a member of the Suicide Club (see Radio-activity).

Faraday, who early made clear the essential unity of chemical and electrical action, in the researches in which he laid the foundations of electro-chemistry, discovered that, in electrolysis, definite electric charges were carried by the moving atoms of matter; gradually the view grew up that the charge carried by the atom was related to the principal valency of the element. After a considerable interval, Helmholtz, in his Faraday lecture to the Chemical Society (1871), sought to draw the logical conclusion from Faraday's facts: he pictured chemical combination as the consequence of atomic charges of electricity and chemical interaction as involving the exchange and neutralization of such charges. Johnstone Stoney, in 1881, baptized these charges electrons. The hypothesis did not altogether satisfy chemists, more particularly on account of the strange variations in the value of atomic weights and basicity; it did not seem to afford an explanation of so-called residual affinity. The chemist, be it said parenthetically, ever has the feeling that the physicist and he are not in full sympathy and that the physicist has a tendency to treat the phenomena somewhat too broadly, if not superficially—to disregard the fine shades of difference which the chemist learns to evaluate through constant intimate intercourse with materials and his introspective habit of mind.

The electronic hypothesis only began to take firm hold of the imagination after Crookes had called attention to the special properties of the negative electric discharge in high vacua, when Sir J. J. Thomson formulated the view that the Crookes cathode discharge was not particular in the ordinary sense but composed of moving particles of electricity (electrons) little more than \( 1/1,800 \) of the mass of the hydrogen atom. Physicists tell us now that not only is matter atomic—which many scarcely believed 20 years earlier and electricity also atomic; but that atomic matter itself is made up of sub-atoms of electricity, and that, if the properties peculiar to the elements and peculiar to their compounds are to be explained, attention must now be turned to the determination of the electronic structure of the atom (see Matter, Constitution of).

Mindful of the long struggle he has waged in determining structure, the chemist foresees that it will not be an easy task for physicists to penetrate the mysteries of sub-atomic structure by experimental means and to arrive at a general agreement as to the validity of their conclusions. The new discoveries are such, however, as he has long awaited and he is profoundly grateful to his physicist colleagues for having taken up the quest at a stage beyond which he could scarcely hope to travel—the methods to be adopted, the kind of logic required, being so different from those proper to chemistry.

We cannot, in fact, overlook the differences which separate the practice of the different branches of science, nor can we disregard the existence of different types of mind suited to one or the other discipline. The line of demarcation, if not the stumbling block, is mathematics: the position of the chemist, in this respect, is midway between that of the physicist and the biologist. The popular saying, "too much learning has made him mad," may be paralleled by the statement that too much mathematics may deprive the chemist of his practical ability, especially of his constructive power; and mathematics seem to be anathema to the biologist and naturalist. Just as it takes all sorts to make a world, so it takes all sorts to solve the infinitely varied problems of science. The attempt to train all by similar methods is bound to end in failure; if it be persevered in, ultimately only the uneducated will be able to do original work.

The new discoveries are those, we say, that the chemist has long awaited. He has often speculated on the constitution of matter and supposed it to be built up of some primordial constituent. He has long thought that the elements are in some way genetically connected, on account of the striking "periodic" relationship they exhibit. He has not been satisfied with the weights he has been forced to assign to many atoms, feeling intuitively that it was not right that even an atom should be inflicted with a weight that had not the dignity of an integer—at least this has been an impression in the minds of those who were fully alive to the wonderful regularities and relationships manifest among the compounds of carbon. Lastly, he has also been prepared to believe that in some cases he might be dealing with mixtures almost impossible to separate: tellurium is a particular case in point, while nickel and cobalt afford another; probably something similar occurs in the case of chlorine.

The facts, however, go beyond all dreams. As the study of the products of radio-active change proceeded, it became necessary to recognize that although each had peculiar radio-active characteristics, the products in a number of cases were not distinguishable chemically; gradually the conception grew up of elements differing in atomic mass but indistinguishable chemically—termed isotopes by Prof. Soddy.

The constant presence of lead in radio-active minerals of various geological ages containing uranium led Boltwood to suggest that uranium may be the source of radium. Soddy, however, did not seem to afford an explanation of such breakdown in the uranium-radium series. Soddy, speculating on the position of the radio-active elements in the periodic system, came to a similar conclusion as to the origin of the lead in thorium minerals; but on this assumption it appeared probable, taking into account the reduction in atomic mass at the several stages, that the leads from the two sources would be homologous (isotopic). The atomic weight to be expected was in the one case 206, in the other 208. Examining thoric-lead, Soddy and Hyman found the value 207.7, whilst common lead gave 207.2.
The X-rays are regarded as vibrations set up by the impact of the electrons upon material surfaces, the character of the rays being determined by the nature of the material which is bombarded. Moseley’s method involved the study of the X-ray spectra of the elements; these he found were characterized by an orderly progression from element to element, so that it was possible from the spectra to arrange them in true order and even to foresee gaps. The spectra are simple and the relationship between successive terms is unmistakable. The numbers indicative of the place of an element in the successional series are spoken of as atomic numbers. The unfilled gaps seem to be few.

We have to recognize 92 species of elements; of these only five are missing—numbers 43, 61, 75, 83, 87.

These results are a complete vindication of the policy long followed by chemists of classifying the elements in accordance with the periodic law of Mendeleeff. Tellurium, it had always been insisted, must be placed in the oxygen-sulphur series, in advance of iodine. The “number” assigned to tellurium is 52, which places it in advance of iodine (53), although the accepted atomic weights are 127.5 and 126.9. Now that iodine is regarded as whole, it may safely be predicted that tellurium is a mixture of homologues; an infra-tellurium has yet to be discovered. In like manner, cobalt has always been ranked before nickel, although the atomic weights were against this order; the atomic numbers they have received (17 and 18) are in accordance with this view. Recently Mr. Aston has obtained evidence that nickel has two constituents, one of mass 68, the other of mass 70; the intensity of the spectral lines are approximately as 2:1, in accordance with the atomic mass (68.68) hitherto assigned to nickel.

Assuming Moseley’s generalization to be correct and that our knowledge of elementary species is nearly complete, it is possible
to discuss the classification of the electro-primary species with a far greater degree of certainty than heretofore. One fact is clear—that a periodic arrangement was never more justified: formerly this involved placing them in the order of the magnitude of their atomic weights and a sub-grouping under families; there was no means of determining whether or not unassigned numbers were or were not those of missing elements.

We are now on surer ground, as we may substitute atomic number—the integer indicative of place in the evolutionary series—for atomic weight: it was better perhaps to speak of this as the species number. In addition, we have to recognize the existence, within some species at least, of sub-species or varieties differing in atomic mass but in other respects, as a rule, so similar as to be indistinguishable except by special methods. These are the so-called isotopes. In the "isotopic elements," apparently, we are dealing, with substances which are closely related in electronic structure, corresponding to the terms in a series of homologous organic compounds.

No precise distinction can be drawn between the terms "chemical" and "physical"—the chemist has availed himself so fully of physical methods that he has made them his own and has difficulty in giving any precise meaning to the expression "chemical property": nevertheless, it has a clear connotation in his mind. The initial and second terms of the great series of paraffin hydrocarbons, methane (CH₄) and ethane (C₂H₆), are, chemically speaking, identical; indeed this is true of the entire group, putting structure aside: the differences are mainly physical—in mass, molecular magnitude, density, boiling point, etc. In the accompanying table the electro-primaries are classified "periodically," in accordance with their "affinities." It is a striking fact that when arranged in the order of their "species numbers" they fall into eight great families: but progression is not along a continuous spiral. When the 25th place is reached, there is a precipitate fall through 26, 27 and 28; the series is then continued on the descending spiral until a similar precipitate fall takes place at 43 through 44, 45 and 46; again the progression is orderly until at 56 there is an astounding drop to 70; after a short interval, at 75 there is another fall similar to the first and second; during the remaining interval, progress is uniformly on the spiral. The species numbers, in some cases at least, serve but to indicate pockets in which homologues may be stored.

The view which was coming into favour in 1921 involves but an extension of the often discussed century-old hypothesis of Prout, that the elements are all multiples of hydrogen. It has long been held that the ratio of hydrogen to oxygen is 1:0083:6, not 1:16; not only is this confirmed by Aston's observations but his measurements seem to justify the conclusion that integral values are to be assigned to all the electro-primaries other than hydrogen (cf. Aston, Jour. Chem. Soc., 1921). It is now established that the existence of integral variants has been observed in respect of species the determined atomic weight of which is not an integral value within the probable limits of error. Thus no evidence of the existence of variants is forthcoming in the case of helium, carbon, nitrogen, oxygen, fluorine, sodium, phosphorus and sulphur; but lithium, boron, neon, magnesium, silicon and chlorine are each to be regarded as a mixture of one or more varieties of a single species. The absolute departure, however, from a whole number is no greater for lithium (6-94) than for sulphur (32-06), though in the latter case the difference is such as much smaller proportion of the whole: sulphur is evidently a material to be further studied from this point of view.

The extent to which the accepted "atomic weight" differs from a whole number is no indication apparently of the values of which it is an integration. Thus lithium (6-94) appears to consist mainly of a constituent of mass 7 with only a small proportion of one of mass 6; but bromide (79-92) is a mixture in nearly equal proportions of variants of mass 79 and 81; still more remarkable is the composition of mercury (200-5), which appears to consist of 6 variants differing in mass from 197 to 204; krypton and xenon are of like complexity. Apparently the weights of separate species are not stable. Thus the phosphorus should be without variants and of mass 31 is remarkable, in view of the difference of 16 units between many of the superposed terms in the first and second lines of the table—it would have been less surprising had it proved to be a mixture of units of mass 30 and 32.

The table has other noteworthy features. The members of each of the three metallic triads, on the short precipitate faces at the right of the table, might be placed in line and the arrangement would have the advantage of bringing the homologies between their corresponding successive terms Fe, Ru, Os; Co, Rh, Ir; Ni, Pd, Pt. The arrangement has the advantage of being parallel with that which must be adopted in the case of the great group of rare-earth primaries—these cannot be entered across the table—if this is, in any way, to be a picture of the homologies manifest among the primaries. Maybe when this rare-earth group is fully studied, rhythmic variations such as are apparent in the three groups of triads will also be made obvious. It is noteworthy that, of the five presumed missing links in the record, a phenomenon which has attracted a great attention, in carbon compounds, is that of metamerism (isodynamic change), one of the earliest and most interesting cases observed being that of ethyl acetate, which, according to circumstances, functions in two distinct ways, in correspondence with either the one or the other of the two formulae—CH₃CO.COOEt or CH₃:CO(0H):COOEt. It has often been supposed that these are but two reciprocal forms and that they are produced by constant, spontaneous, oscillatory change; the evidence is convincing, however, that like all other cases of chemical change, the alteration is the outcome of a more complex, reversible process conditioned by a conducting impurity. Thus CH₃CO.COOEt+H₂O=CN.CX₂(OH):COOEt+CH₃CO.OEt+H+X. The two forms have been isolated and their stability shown to be a question of purity.

That alterations take place in internal electronic structure in simple compounds and even in "elementary" materials is already clear. Water affords one of the most striking examples, in the sudden large increase in volume which it undergoes on conversion into ice. The volume increase at the melting point of ice cannot be supposed to be due to their arrangement in any "open" form in ice. Can it be supposed that the electronic systems "expand" in some way. What is most striking is the suddenness with which the change is accomplished, at a glance the temperature or nearly so—for there is evidence that ice is present in water above the freezing point and also that ice contains water.

Evidence of "internal" structural change in elementary materials is to be found perhaps in the peculiar manner in which their heat-
absorbing capacity is dependent upon temperature. The amount of heat absorbed by atomic proportions of a majority of the primaries, when their temperature is raised through a given interval, it is well known, is nearly a constant quantity over a wide range of temperature; only in the specifically non-metallic elements, silicon, beryllium, boron and carbon, is the departure from this "rule" at all considerable, and in the case of these, as the temperature is raised, the heat capacity increases, until towards 1,000° their behaviour approximates to that of the metals. It was long supposed, in fact, that there was a general tendency for the atomic heats to converge towards a constant value as the temperature was raised and to diverge as the temperature was lowered. Taking into account the fact that metals generally appear to be of simple molecular composition compared with the non-metals, it was not improbable that the differences were, in the main, differences due to molecular complexity; recent determinations of specific heat at the very low temperature of liquid hydrogen (50° absolute), by Sir James Dewar, have brought to light, however, the surprising fact that heat capacity is subject to periodic variation, much as the volume occupied by atomic proportions varies even at ordinary temperatures. The two properties are contrasted in the accompanying diagram.

The striking fact is brought out in this diagram that whilst the chemically most active metallic elements (the alkali metals) are but little affected, the best defined metals diminish in heat-absorbing power to a very marked extent.

The values deduced with the aid of ordinary materials, especially in the solid state, cannot be regarded as "atomic" in any proper sense of the term, as they are of different degrees of molecular complexity and the molecular complexity varies considerably with temperature. Thus a large number of the metals appear to have monatomic molecules, whilst there is reason to believe that those of the non-metallic elements, carbon especially, are of considerable complexity; but even in the case of the elements having monatomic molecules, intermolecular affinity is subject to great variation, being slight for example in mercury but considerable in the case of metals such as gold, silver and copper. In a complete theory of atomic structure, all these variations must be taken into account.

The correlation of molecular structure with function, in the carbon compounds, has been carried so far that the chemist has entire confidence in his conclusions—because of the large number of instances in which a comparison of fact with hypothesis can be made. The assumptions involved are few and it is more than remarkable that it should have been possible to erect so vast and complex a system upon so simple a foundation. The structural formulae of organic chemistry are to be regarded, however, mainly as condensed symbolic expressions, indicative of the general arrangement of the constituent radicles and of the functional behaviour of the compounds represented, not as absolute expressions of structure; indeed, it is becoming clear that the conventions which have hitherto sufficed should be modified in certain particulars to give fuller symbolic expression to the ascertained facts and to render the formulae more nearly a representation of the molecular architecture. In the case of the compounds of elements other than carbon, valid methods of determining structure are yet to be devised. It is surprising, to take an example, that we have no clear conception of the atomic arrangement of so simple and important a substance as sulphuric acid, H₂SO₄.

New methods of promise are coming into use, and it is to be expected that much will be learnt, especially by the study of the internal structure of crystalline solids, by crystallographic (geometric) methods and by means of X-rays—a field of inquiry opened up by Laue and then by the Braggs and others.

Frankland's original conception that the carbon atom has four affinities still holds the field. In modern times, it has been amplified by the introduction of space conceptions and the use of the tetrahedron as a model of the atom; in this way greater precision has been arrived at because of the limitations which are introduced. Perhaps the most important outcome of the hypothesis is, that whenever—but in no other case—a system is formed in which a single carbon atom is associated with four different unit systems, the complex may exist in two like asymmetric forms (of opposite character), distinguished by their power of influencing plane polarized light in opposite directions.

This conception of the carbon atom is entirely justified by the results of the analysis of the internal structure of the diamond by means of X-rays, carried out by Sir William Bragg and his son W. L. Bragg. The arrangement of the carbon atoms is such that every atom is the centre of gravity of four others arranged around it in tetrahedral fashion. Apparently there are definite sub-centres of force on the outskirts of an atom; in the carbon atom of which the diamond is composed, there is evidence of four such sub-centres arranged symmetrically—that is to say tetrahedrally. The atoms in the diamond form two sets; in each set the individual atoms present the same orientation and constitute a cubic space-lattice, but the orientations of the two sets are opposite. The effect of this difference is mirrored in the X-ray spectrum. This conclusion of the physicist is a complete justification of the views long held by chemists that the carbon atom has directed valencies and may give rise to asymmetric structures.

In the Bragg model of the diamond, although they are united similarly and symmetrically, in all four directions of trigonal axes, the carbon atoms can be allotted to similar sets of six, in each of which the individual atoms are united in the manner pictured by the chemist in the symbol of hexamethylene.

Although, in the diamond, the carbon atom is the physical unit or molecule, the molecule may equally well be regarded as indeterminate, indeed as coterminate with the mass, as the constituent units are uniformly related. As influencing our views as to the manner in which solids act in solutions and attract molecules of their own kind, it should be noted that each carbon atom at the exposed surface of the diamond mass has an affinity free.
Chemists have generally assumed that contiguous carbon atoms may be united in three ways, either by single affinities or by two affinities or by three affinities, leaving three, two or a single affinity free to unite with other radicals, thus—

\[
\text{C}_4\text{C}_4 \quad \text{C}_4\text{C}_4 \quad \text{C}_4\text{C}_4
\]

Accordingly in van't Hoff's spatial formulae, the two tetrahedra are shown united either (1) by two apices, or (2) edge to edge, or (3) face to face. The three forms of union have all been regarded as possible—in spite of the fact, that the assumption is made, that the four affinities of the carbon atom are exercised in the direction of four lines drawn from the center of mass through the apices. It has been assumed that the affinities become more or less bent or stressed—as in von Baeyer's well-known hypothesis: hence the instability and attractive power of the so-called unsaturated compounds. In effect the existence of a difficulty has been recognized but met by a compromise.

The only positive evidence brought forward in disproof of Frankland's contention that two atoms may be united by more than single affinities, and that when each has several affinities not engaged by other radicals they mutually satisfy each other, is that advanced by Julius Thomsen in the fourth volume of his celebrated *Thermodynamische Untersuchungen*. Thomsen, from his thermo-chemical data, that in ethenoid and still more in acenoid compounds, the bond of union was weaker, not stronger, than that in the equivalent paraffinoid compound. He also maintained that the oxygen atom was not held by two affinities in keto—(CO) compounds; and he even threw doubt on the formulae assigned to ethylene oxide. Of late years, the chemist's peace of mind has been disturbed, and a suspicion created that all is not right with the symbolic system in use, by the discovery of unsaturated compounds in which the existence of single free affinities must seemingly be granted: Gomberg's triphenylmethyl, C(CJHJ)₃, being one of the most striking and compelling cases which no structural sophist has been able to explain away. On paper it is all so easy, and chemists hitherto have been satisfied to work on paper to draw plans with the aid of certain conventions; now the time is at hand to attempt the representation of our ideas in the solid. There is reason to suppose that the study of solid structure, by geometric and X-ray methods in combination, may carry us over our difficulty.

Conflict must arise of the difficulty of interpreting the evidence. This is true already in one very simple case—that of common salt. The interpretation put on the results of X-ray analysis is that the chlorine and sodium units are so placed and so arranged relatively that there is no reason to believe in the existence of a molecular unit NaCl, within the mass. The chemist stands unconvinced before such a statement—he is not prepared to sacrifice the cherished convictions of a lifetime, not being satisfied that the new method is one in which implicit faith may be placed—the more as it has been shown, in the parallel case of potassium chloride, that a but slightly different arrangement of the units is required to give a geometrical structure, in entire harmony with all that is known of the geometrical and physical peculiarities of the crystal, involving no sacrifice of the chemist's view that the molecule KCl has separate existence (see Barlow, *Proc. Roy. Soc., 1914*).

An attempt has been made, in recent years, to correlate outward form or crystalline structure with internal molecular structure, based upon the conception introduced by Barlow and Pope, that, in the case at least of the elements carbon, hydrogen, oxygen and nitrogen, the volume occupied by the atom, in any given compound under given conditions, is proportional to its valency, and that, when changes are effected in a molecule, the ratio is maintained constant although the actual volume may be changed. Taking into account the extraordinary number and variety of the compounds of these four elements, their marked stability and the case with which interchanges can be effected within the molecules, this conclusion is all but unavoidable; but the solid models built up of spheres of volume 1, 2, 3 and 4, in accordance with such a valency-volume conception, have not answered expectation. A simple modification is possible, how-

ever, which is of promise. If a single unit sphere be taken to represent an atom of unit valency, such as hydrogen, atoms which are either di- or tri- or tetra-valent (oxygen, nitrogen, carbon) may be represented by models composed respectively of two, three, and four such spheres in close contact (cf. Barlow, *Proc. Roy. Soc., 1914, 91:10*). Such complexes can be made into close-packed unlimited assemblages throughout which each sphere is in contact with 12 surrounding spheres; no such uniformity can be attained if the spheres differ in volume.

The adoption of the method indicated has important consequences. In the case of carbon, the atom is represented by four unit spheres, the centres of which lie at the four corners of a regular tetrahedron. The four hollows on the four faces corresponding to the tetrahedron faces may be regarded each as the seat of an affinity; the union of two carbon atoms by single affinities, therefore, is to be represented by closely approximating two tetrahedral groups face to face, so that the three spheres of a face of the one tetrahedron key into the three hollows between three spheres of the opposed face of the other; the two atoms are thereby oppositely oriented. The eight sphere centres of the complex thus formed mark the angles of a regular rhombohedron, the short diagonal of which, measured on the surface, would be equal to two of the spheres, and the four sides of the rhombic faces would be equal to three of the spheres. In continuation of the two lines of spheres forming a face, the model may be taken as that of ethylene oxide and it has the peculiarity that, whilst the twin oxygen spheres face the hollow in one of the two carbon pyramids, only one of them touches the other carbon pyramid at one of its apices. The condition is much that suggested by Julius Thomsen—certainly one of unsaturation. Such models can be made into close-packed assemblages of any dimensions, which is not the case when the models used are single spheres of varying volume. The adoption of such models has important consequences. In the case of carbon, the atom is represented by four unit-spheres piled in a pyramid. The four hollows on the four faces of the pyramid may be regarded each as the "seat" of an affinity: the union of two carbon atoms by single affinities, therefore, is to be represented by approximating two pyramids, face to face, rotating slightly, so that the three spheres of a face of the one tetrahedron fall into the hollows between the three spheres of the opposed face of the other; this is equivalent to setting one of the pyramids on its base and interlocking it with the second pyramid placed upside down.

The van't Hoff school has always assumed that the affinities act from the apices of the tetrahedron and have not taken the consequences of close-packing into account. One deduction from their assumption has been that single united carbon atoms are free to rotate—but this is not in accordance with the facts. To take only the case of the aldohexose sugars, of the form COH \((\text{CHO})_{n} \text{CH}_2\text{OH}\). The four OH units in the four \((\text{CHOH})\) groups can be arranged relatively to the two terminal groups in eight different positions and each of the forms has its optical opposite. Fourteen of the sixteen compounds thereby formed are known and are stable substances. There must be at least one configuration of principal stability in such a system and if singly bound carbon atoms were free to rotate, a tendency to pass into this stable form should be in evidence. Nothing of the kind is observed: on the contrary, when change takes place it is confined to the part of the system that is directly attacked. The tetra-sphere model of the carbon atom does serve to bring out a certain face-grip between the two united carbon atoms.

By placing tetra-spheres together, in face contact, in the manner described, endless chains may be formed and it is conceivable that the carbon atoms in the paraffinoid hydrocarbons are arranged in rectilinear columns presenting similar parallel sections. It is, however, possible that, under some conditions at least, as in the hexas sugars, there may be a tendency to form condensed systems or rings: peculiarities in the optical behaviour of compounds containing paraffinoid side chains have been noticed which seem to favour such a conclusion, change proceeding irregularly and uniformly, from atom to atom, as the chain is increased in length but a different peculiar value is observed at the fifth carbon atom and at each subsequent fifth atom. It is
to be expected that light will be thrown on problems of this order by studies, such as those Langmuir has initiated, of the space occupied by the molecules in liquid films.

The tetra-spheres may be arranged in sheets in any desired numbers, but from such sheets hexagonal blocks may be dissected out, consisting of six tetra-spheres arranged as in benzene, three base downwards and three base upwards, linked in a six-ring system. If to one such segment, six unit-spheres representing six hydrogen atoms be so added that they occupy the six hollows in the six exposed faces of the six tetra-spheres round the periphery of the model, a model of the benzene molecule is produced. This is easy to construct and the hydrogen atoms form a separate central chaplet, owing to their position in the hollows at the waist of the system. To pack benzene units together, it is necessary to displace the hydrogen spheres slightly from their central position, so as to bring half of them into the one and half into the other outer layer of carbon unit-spheres. The operation is symbolic of the change involved in the passage of benzene from the liquid into the crystalline state.

The configuration of the benzene model thus contracted is that of two superposed triangles, each having five spheres, the three corners being occupied each by a hydrogen sphere, the remaining space by unit carbon spheres. The two superposed triangles are in reversed positions, the apex of one falling upon the base of the other, whilst the carbon units of the upper layer fall into the hollows between those of the lower layer. The model is therefore hexagonal in outline with sloping sides.

A feature in the model is the presence both at the upper and lower surface of three unsatisfied "carbon faces." Benzene, in other words, is to be pictured as possessed of a bundle of three unsatisfied affinities at each free surface: these correspond to the six affinities directed inwards in the centric formula. It is easy to construct models of benzene derivatives, proceeding on similar lines. A matter of interest to be mentioned, in this connexion, is the fact that, in close-packing the units, they cannot generally be arranged side by side but contiguous units must be made to differ in level by one layer in order to secure a fit; the mass therefore has a stepped surface; half its constituent molecular units range higher by the thickness of a layer than those of the other half, the two sets interpenetrating. In a number of cases it has been found that the data deduced directly by geometrical methods from these models, taking into account the recorded characteristics of the compounds dealt with, are in practical agreement with the crystallographic data.

Spheres are used in the construction of the models as a convenient means of showing the relative situations in space of the hypothetical constituent sub-centres of force referred to; these will present homogenous symmetrical repetition such as is characteristic of crystal structure. It is not intended, however, to suggest any difference in properties between the space contained within the spheres and that occupying the interstices between them. Indeed, but for the greater mechanical difficulties involved, a partitioning of space into identical cells of regular dodecahedral form would with profit take the place of a closest packed assemblage of equal spheres of the cubic system of symmetry.

Barlow has succeeded in partitioning space into similar plane-faced cells, each having 13 faces, according to hemihedral cubic symmetry; he contends that, if pairs of the cells are symmetrically chosen to represent the molecules of potassium chloride, the arrangement of the pairs completely matches the crystal form; he points out that this highly symmetrical arrangement is derived, by a very simple modification, from the interpenetrated face-centered lattices assigned by the Braggs to the crystal in question. In a number of cases it has been found that the data deduced directly by geometrical methods from these models, taking into account the recorded characteristics of the compounds dealt with, are in agreement with the crystallographic data to an extent well within the ordinary errors of measurement.

Necessarily, spheres are only suitable for the purpose of hand demonstrations. In developing the crystallographic forms, the compression the spheres undergo has to be taken into account. The simplest form of close-packing would involve their compression into dodecahedral cells; but both 13-faced and 14-faced solid units are also possible. The crystallographic peculiarities of potassium chloride may be completely matched on the assumption that the KCl unit is formed of two such cells.

It, as argued, carbon atoms cannot be united by more than single affinities, ethylene and still more acetylene are truly unsaturated and the conventional symbols C=C and C=C are to be read as implying merely certain degrees of unsaturation.

It is a logical consequence of the same conclusion, that only one form of carbon can exist—the diamond. If so, graphite and charcoal are not composed of allotropes of carbon. The elementary nature of the prime constituents of these materials may be questioned on various grounds. Sir Charles Parsons, who has carried out an extended inquiry with the object of producing diamond, has thus far been unable to satisfy himself that it can be obtained by artificial means: he is inclined to think that the crystals obtained by Sir William Crookes may not have been diamond but perhaps silicon compounds of the carborundum type. Diamonds are found in volcanic vents and it is conceivable that they have been formed under transcendental conditions, which cannot now be realized. If allotropes, the two forms should be in equilibrium: as graphite has the higher heat of combustion, the production of graphite alone, without diamond, at high temperatures is remarkable to say the least, particularly in view of the behaviour of phosphorus. Graphite, apparently, however produced, always contains hydrogen. Most striking also is the whiteness and hardness of diamond and its resistance to all chemical agents, when contrasted with the blackness and softness of graphite and the amorphous carbons and the readiness with which they are oxidized. The conversion of the diamond into graphite (?), when it is bombarded by the cathode discharge, is very superficial and may well be due to the interventive action of water which is necessarily present in any vacuum tube through which a discharge passes.

Lastly, the black colour of graphite and the charcoals is an indication of a complex ethenoid or it were better said benzenoid structure, such as the heaviest hydrocarbons are known to possess. The production of mellichi or benzenehexacarboxylic acid, C₆(COOH)₄, when charcoal is oxidized, may be regarded as proof that, in charcoal, there is a nucleus in which a benzenoid system of carbon atoms is surrounded by several similar systems, and it is conceivable that, fusing these, there may be others.

The stability of such a system, the maintenance of the benzenoid structure, might be secured by the addition of a few hydrogen atoms at the periphery, which would disturb the symmetry sufficiently to modify the electronic orbits and break up the diamond arrangement.

If the carbon atoms in diamond are in paraffinoid arrangement, the properties would be uniform throughout the mass, and the hardness of diamond may be supposed to be due to the manner in which every internally saturated atom is combined with four others: this explanation may be extended to carborundum, silicon being the analogue of carbon. In the benzenoid system of graphite, contiguous benzene units would perhaps be more firmly united than the superposed layers of complexes: hence its softness and the readiness with which it is split into thin layers.

If valid deductions may be drawn from models such as have been described, it would seem probable that no structural alteration—in the ordinary sense of the term—is involved in the production of unsaturated compounds. In the case of the formation of quinine, for example, it is customary to suppose that not only are two atoms of hydrogen withdrawn from quinol but that the two oxygen atoms from which they are taken away become doubly united with the benzene system and that this is coincidently changed in structure—

\[
\text{OH} \quad \text{OH} \quad \text{OH} \quad \text{OH} \\
\text{O} \quad \text{O} \\
\text{H} \quad \text{H} \\
\text{O} \quad \text{O}
\]

The model suffers no such change: only the molecular units need to be rearranged to make good the withdrawals. The changes...
CHEMISTRY

must be in some of the electronic systems within the molecules; obviously, when the oxygen in no way has its attention engaged by hydrogen, its influence must in some way be felt more in the neighboring carbon system; these, however, are dynamic changes, not evident in a model. The limitation is one to which our structural formulae have always been subject.

Whatever be the distribution of affinity in the carbon atom, in compounds it appears to be greatly modified, so that structural models, like structural formulae, must be interpreted with caution. To take a simple case, the change from benzene to hexamethylene seems to involve merely the addition of six more hydrogen atoms at the periphery, not the direct neutralization of the two sets of three affinities at the free carbon surfaces.

This pulling down of the affinities into two planes seems to be a general rule. Mr. Barlow finds, for example, that the model of tartaric acid constructed on this principle is in absolute accord with the crystallographic peculiarities of the acid.

Fig. 2 shows front and back views of the arrangement of the units in glucose, C₆H₁₂O₆. The carbon units may be distinguished without difficulty as the grey spheres, the cross denoting the position of the pyramidal apices; the white spheres are the hydrogen units; the twin dark spheres the oxygen atoms. Each layer consists of a succession of rows of four spheres. The free carbon area is of considerable extent at both surfaces: it will be obvious that, if some degree of residual affinity were exercised over these areas, successive layers of molecules might well be attracted into position, if once a single layer were deposited, as in crystallization.

FIG. 2
Front and Back Views of the Arrangement of Units in Glucose.
(From Journal of the Society of Arts, Sept. 12 1919.)

Chemical Change: Determinant and Catalyst.—Although the subject of chemical change has been much discussed of late years, the chief advance has been in the attention paid to catalysts, which have acquired popularity owing to their use in a number of industrial processes. Although it is recognized that often some determining agent is required to condition an interaction, and the feeling is widespread that this is more generally true than has been supposed, the primary conditions of chemical change are seldom set forth; seldom is the practice departed from of using simple equations in which the two agents and the resultants alone appear, the need of a third substance being left out of account and unindicated.

The determining process is spoken of with increasing frequency as catalysis, the supposed agent being termed the catalyst. The conception was introduced by the great Berzelius in 1835, and was applied by him to such diverse changes as the hydrolysis of starch by acids and also by diastase; the oxidation of various substances in presence of platinum, especially when used in the finely divided state (platinum black); and the formation of ether from alcohol by means of sulphuric acid. Berzelius drew no distinction between interactions in solution and those in which solids such as platinum were involved. It is clear that he took an electro-chemical view of the process—his opinion being that the office of the catalyst is to awaken slumbering affinities through its presence and to determine a greater electro-chemical neutralization; probably no one has been nearer to our modern conception. Whether he had been in any way influenced by Faraday's electro-chemical researches of 1833-4 is not clear.

Now that it is so generally admitted that Faraday's dictum is to be accepted, that ordinary chemical affinity is a consequence of the electrical attractions of the particles of different kinds of matter and that the forces termed chemical affinity and electricity are one and the same, it may be asserted, as a necessary corollary, that the conditions which determine chemical action are those which determine electrolytic action.

Speaking generally, it may be affirmed that two substances cannot interact; a third must be present to determine the necessary slope of potential and flux of current. Thus zinc, whether highly purified or amalgamated, is all but unattacked by an acid, and it is logical to assert that, if pure, it would be unattacked; when coupled with an electro-negative inert conductor, it is dissolved, indeed, very rapidly, if the resistance in circuit be small. Or to condition attack, a depolarizer may be used, as in the case of copper, for example, which readily dissolves in dilute sulphuric acid in the presence of oxygen.

The rule appears to be that the three necessary factors must be conjoined in a conducting circuit; one of them must be an electrolyte; one of the remaining two and the electrolyte must be substances that can interact; the third may or may not take part in the chemical interchange—if it takes part, by acting as a depolarizer, it adds to the efficiency of the change, raising the electro motive force. Breerton Baker, in the course of his refined studies on the influence of water as a determinant of chemical change, has given abundant proof of the accuracy of the above given definition, particularly by showing that a mixture of hydrogen and oxygen cannot be fired, even in presence of water; and that interaction takes place only when an impurity is present, which impurity, together with the water, forms an electrolyte. A trace of acid suffices.

Years before this result was obtained, it was possible to predict that water alone would not condition the interaction of hydrogen and oxygen—because it was not an electrolyte. It is true that this contention is not generally admitted—it is held that water penetrates a slight conductivity; but this conclusion involves the unjustified assumption that Kohlrausch dealt with pure water and that the minimal conductivity which he observed was an intrinsic property of water. The course followed by Kohlrausch in purifying water, however, involving as it did nothing more than distillation within closed glass tubes, was by no means a refined one from our modern point of view; to assume that he had reached finality is absurd: it is impossible to obtain a vessel without surface impurity which is not open to attack; access of atmospheric impurity cannot be entirely prevented; furthermore, some form of electrode must be used; pure water, therefore, will ever remain an ideal, and whilst it is logical to extend the curve representing the loss of conducting power, as the impurity is reduced to zero origin, on no theoretical grounds are we called on to believe that it should come to rest short of this point.

Especially is this the case, in view of the conclusion of the dissociationist school, that in aqueous solutions the dissolved substance is alone resolved into its ions: muriatic acid, for example, is assumed to be a mixture of undissociated molecules of water with the separated ions, H and Cl. Unfortunately, the modern chemist too often lacks feeling for his material, and, without sympathy, understanding is impossible. It is impossible to put two so closely related and similar compounds as water (H₂O) and hydrogen chloride (HCl) on the different planes they necessarily occupy, if the one be regarded as all but entirely stable and the other as entirely unstable.

That a profound chemical change takes place on bringing together the two compounds, hydrogen chloride and water, is beyond question. To regard the water as inert is impossible—if it were, the gas would not be so attracted as it is. Equations such as the following are not merely rational but necessary expressions in illustration of the changes that may occur:

\[ \text{H}_2\text{O} + \text{Cl}_2 \rightarrow \text{HCl} + \text{HClO} \]

The part played by water in activating hydrogen chloride may be compared with that of magnesium in Grignard's well-known
agent. No one assumes that in this agent alkyl and halogen are present in the state of free ions—they are dissociated but only in the sense that they are separately held by the metal. The forces of residual affinity have been entirely disregarded by the dissociationist school; and not being practised chemists, knowing nothing of the organic side, they have left facts out of account. The implications in Longfellow's lines, with reference to the sea—

Only those who brave its dangers
Understand its mystery—

will ever be true and generally applicable. It is necessary to give this warning to the coming generation of workers.

Granted that the interaction, in the case of the interaction of water from hydrogen and oxygen, be determined by the presence of an electrolyte (an acid impurity), is this to be thought of as the catalyst? What is a catalyst?

The definition of a catalyst which is generally current is that it is an agent which merely accelerates a change in being: but this is based upon the gratuitous assumption that two pure substances can interact. If this definition could be accepted, the acid impurity determining the rapid interaction of hydrogen and oxygen when a mixture is fired might be called the catalyst.

The issue is not quite so simple, however, since another class of activating agent has to be considered: namely the solid, such as platinum and the enzymes of natural occurrence. Hydrogen and oxygen at once interact when brought into contact with platinum black or with a "clean" platinum plate. Again, it is customary to think of the platinum only as the determining agent; there can, however, be no doubt that, in this case also, the electrolyte must be present. It does not seem probable that platinum in itself would form a conducting circuit with hydrogen and oxygen: if the two gases were condensed at its surface even to the extent of being liquids, these would be non-conducting liquids.

The probability of this view is enhanced when the nature of the process is taken into account and it is realized that the primary interaction is not even that of hydrogen and oxygen atoms but that, initially, the oxygen is converted into hydrogen peroxide, acting as "depolarizer" in an electrolytic circuit, whilst the hydrogen is "hydroxylated," as shown in the following equation:

\[
\text{H}_2\text{O} + \text{HO} \rightarrow \text{HOH} + \text{HO}.
\]

In the next change, the hydrogen peroxide acts as depolarizer, so that the reduction of the oxygen molecule is affected in two stages. According to this view, the electrolyte is the determining agent, the platinum exercising only an accelerating influence— its definition of a catalyst; as an accelerator be retained, the platinum rather than the acid is to be regarded as the catalyst.

Two other cases may be considered with advantage—(1) that of a ferrous salt in promoting oxidation by means of hydrogen peroxide; (2) the hydrolytic action of enzymes. Hydrogen peroxide has little effect as an oxidizing agent and probably, if it could be used in pure solutions, it would be without action; oxidation at once sets in on the addition of a trace of ferrous salt. Familiar cases are the liberation of iodine from iodides (rendered evident by the presence of starch) and the oxidation of tartaric acid to dihydroxytauric acid (rendered evident by the appearance of a violet colour on addition of excess of caustic soda).

What is the function of the ferrous salt—is it of such a kind that it is to be ranked as a catalyst? Its function would seem to be rather that of carrying the peroxide into action through the formation of a perhydrod which can act as an electrolyte, thus—

\[
\text{Fe}^{2+} \text{SO}_4 + \text{HO} \rightarrow \text{Fe}^{2+} \text{O}_2 \text{H} + \text{OH}_2.
\]

Ferrous sulphate. Hydrogen Ferrous sulphate peroxide. perhydrod.

The case of the enzymes is more complex. These are all of natural origin and can only be judged by their actions. It is desirable to confine the term to hydrolytic agents.

Take the case of invertase, the enzyme present in ordinary yeast, which acts only on cane sugar and certain derivatives of this sugar. Cane sugar is hydrolysed, more or less readily, by all acids, being converted into the two hexoses, glucose and fructose:

\[
\text{CaH}_2\text{O}_4 + \text{OH}_2 \text{HX} = \text{CH}_2\text{H}_2\text{O}_4 + \text{CaH}_2\text{O}_4 + \text{HX}.
\]

It is similarly affected by invertase acting in a solution which is only faintly acid. Taking into account the amount of change effected by a small amount of enzyme compared with that effected by a relatively large amount of even a strong acid, it is clear that the enzyme is far more active than is any acid per se; it certainly, therefore, can be regarded as an accelerator rather than as a determinant of change. The minute amount of acid which may be the necessary may be regarded as active in the same way that a trace of acid is active in determining the interaction of hydrogen and oxygen at a platinum surface.

The essential differences between the two classes of agent, the acid and the enzyme, become obvious when the rates at which action proceeds are contrasted. In any interaction occurring in an aqueous solution, such as that in which cane sugar is hydrolysed by an acid, so long as the solution be not too concentrated, the disappearance of water may be disregarded, owing to the relatively small extent to which it is withdrawn—so that only a single changing substance need be considered. In such a case, the amount of change, during each successive interval of time, is proportional to the amount of unchanged substance present. If 10% disappear during the first period, 10% of the remainder will disappear during each successive period, i.e., 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, etc. The graph representing the rate of change is a logarithmic or exponential curve.

When cane sugar is hydrolysed by the enzyme invertase, the rate of change is of an entirely different order; within wide limits of concentration, well beyond the 50% limit, equal amounts are hydrolysed in each successive interval; the graph representative of the rate of change is, therefore, nearly a straight line. This behaviour is characteristic of enzymes generally, though in many the rate is modified fairly soon by the reversal of the change or otherwise. The same behaviour is met with in solid catalysts, e.g., the reduction of the fatty oils and of unsaturated compounds such as ethylic cinnamon (C,H,CH : CH. CO,Et) and anethol (C,H,CH,OH), by hydrogen in presence of finely divided nickel. Such results cannot well be explained except by the concentration of the interacting materials at the solid surface; as enzymes behave like nickel, they too must be thought of as acting in a similar way and as merely suspended in the liquid in which they are brought into action. This explanation is rendered the more acceptable by the fact that enzymes will act even when suspended in alcohol, in which they certainly are insoluble. It thus appears desirable to confine "catalyst" to particulate agents acting at surfaces of concentration, and to apply the term "determinant" to agents, such as ferrous sulphate or acids, acting under conditions of uniform distribution, in solution. The determinant may be said to be required in all cases, being the agent which constitutes the solvent an electrolyte. It is here assumed that no liquid per se is an electrolyte, excluding fused salts as liquids.
CHEMISTRY

ing to Tamman, ice can exist in no less than six forms, depending on the conditions of pressure and temperature. No substance can be studied better from the electronic standpoint.

On the ground of analogy, the chemist can foresee the existence of an active \textit{Hydronol} and of a variety of neutral \textit{Hydrones} corresponding to the paraflinoid polytheneums, thus

\[
\begin{align*}
H_2O & \quad \text{H}_2\text{O} \cdot \text{OH} \\
& \quad \text{H}_2\text{O} \cdot \text{OH} \\
& \quad \text{H}_2\text{O} \cdot \text{OH} \\
& \quad \text{H}_2\text{O} \cdot \text{OH} \\
\end{align*}
\]

No valid method of determining the complexity of the molecules either of water or of ice is known; all that can be asserted is, that water especially must be a mixture and that its composition not only may but must be subject to considerable variation as the temperature is changed or substances are dissolved in it. Whatever the composition of the mass, at the surface, the simple molecules of hydron (OH) must be present in maximum proportion; and this will also be the condition at the surface of solid particles suspended in an aqueous solution.

As the most active solute in water must be the hydron molecule, in a solution in which fine particles are suspended the liquid layer at the fluid-solid interface should be more concentrated than the general body of the solution. Hence the special activity of enzymes and other particulate agents: apart from any special attractive influence exercised by the solid surface, the layer at the interface is likely to be specially active as a solvent.

The enzymes, however, exercise a selective activity which is altogether peculiar — each enzyme can induce the hydrolysis, if not of a single compound, at most of a set of structurally similar compounds. Thus the enzyme urease will act only on urea. Invertase acts only on cane-sugar or derivatives of this sugar in which its special structure is retained and only an addition made to the molecule.

In the case of glucose, a large number of compounds are formed by the introduction, in place of either the one or the other of two terminal hydrogen atoms, of some equivalent group. Two series of glucosides are thus produced, known respectively as α- and β-glucosides. An enzyme is present in yeast (maltsace) which will induce hydrolysis of all the α-glucosides; the bitter-almond contains an enzyme which acts only on the β-compounds.

The only possible explanation of this behaviour seems to be that the enzyme is structurally related to the compound which it affects, so that it actually fits upon it and grasps it, as it were. This view involves the further assumption that the specific agent of change is also carried by the enzyme, as the amount of acid which suffices to determine the exercise by the enzyme of its maximum activity is so small that it scarcely seems probable that the rapid action is the consequence of the mere concentration of this acid together with the hydrolyte at the surface of the enzyme; nor is such an assumption compatible with the selective activity of enzymes. More probable is it that an acid radicle is operative which the enzyme itself carries, this being in such a position that it is brought into proximity with the attached molecule (the hydrolyte) at the point at which hydrolysis takes place — the acid which is added serving to maintain this radicle free and also acting as the necessary electrolyte, as in the case of platinum.

It should be added that, although platinum and similar catalysts are not structurally selective agents, their action is in some respects limited — as, however, is that of most chemical agents. Thus, whilst hydrogen and oxygen interact at a platinum surface, a mixture of carbonic oxide with oxygen remains unaffected; indeed, carbonic oxide interferes with the oxidation of hydrogen in presence of platinum; this behaviour, however, is perhaps less a consequence of the lack of affinity of carbonic oxide for platinum than of intrinsic peculiarities of the gas. Platinum and similar catalysts, especially nickel, have a very wide range of activity as hydrogenising agents.

The question remains — how is the action of platinum effected; is it merely a physical condensing agent or is it to be regarded as acting chemically? The view has long been held that it may combine with oxygen — if not with hydrogen — and that it promotes oxidation through the intermediate formation of an oxide.

Recently, Willstätter has shown that platinum and palladium are without action even as hydrogenising agents if they have been freed from oxygen. He advocates the view that a compound is formed, which is both hydride and peroxide, in which hydrogen is present in a more readily dissociable form than in the hydrides of the metals. Spongy platinum, prepared by reducing chloro-platinic acid with formaldehyde in presence of caustic potash, may be deprived of oxygen by suspending it in glacial acetic acid and passing hydrogen through the liquid, either in the course of 30 hours at atmospheric temperature or in 8 hours at 50° to 65°. Such a product is insoluble in muriatic acid and does not liberate nitrogen or of an acid — the potash solution, etc., will not condition the hydrogenation of benzene to benzylhydrogen, etc., but acquires the power when shaken, during a short period, with air. During hydrogenation, the catalyst invariably becomes deoxidized by the action of the hydrogen and needs revivification by oxygen. Willstätter suggests that the metal is converted into either the peroxide PtO₂ or the corresponding perhydrod PtO₂·OH and that this is convertible into the hydride H₂PtO₂·OH.

By this assumption, the activity of platinum in promoting oxidation is brought entirely into line with that of ferrous sulphate, which, it has been pointed out, is probably active as a perhydrod. Interesting light is also thrown on the hitherto enigmatic behaviour of haemoglobin, which combines directly with oxygen, forming oxyhaemoglobin, by the fact that the oxidized platinum catalyst may be deprived of its oxygen and rendered nearly inactive by continuous exhaustion with a high vacuum pump, the means by which oxyhaemoglobin may be entirely deprived of oxygen: the parallel is made all the more remarkable by the fact that the oxygen may be displaced from oxyhaemoglobin by carbonic oxide, which renders platinum inert towards hydrogen. Oxyhaemoglobin has a big molecule, as is composed of a protein in association with haematin; if the oxygen be present in it, perhaps in combination with the iron atom, in the form of perhydrod and it acts in the blood corpuscle as a particular agent, the remarkable oxidizing power of the blood may be reckoned among the actions promoted by catalysts.

It is customary to regard haemoglobin as a "colloid," but in using this term we are again in difficulty owing to the lack of a clear definition of its precise connotation. Latterly the word has been used almost as the synonym of the state of very fine sub-division — any substance present in suspension in a liquid in a very finely divided state has been spoken of as a colloid.

Originally this was not the meaning associated with the term by Graham, who introduced it and applied it generally to glue-like substances. He appears to have thought of the colloid as soluble but as merely opposite in the scale of solubility to the ordinary crystalline, more or less easily soluble substances of relatively low molecular weight — in fact, as a big, lumbering molecule, with slight affinity for the solvent and therefore ready to separate from it in the pectus or particulate form. Unfortunately, not only has the connotation of the term been altered but a confused language has grown up about the term which renders the consideration of the activity of substances in the particular state specially difficult. Far worse, the attempt has been made to constitute so-called Colloid Chemistry a separate discipline, the designation being arbitrarily confined to suspensions of fine particles varying from one thousand (μ) to one millionth (μμ) of a millimetre in diameter.

If this definition be accepted, the "colloids," when separated, in the particular state, from solutions should function as catalysts under favourable conditions; and this appears likely to be true. One of the few cases apart from the action of enzymes — which are selective catalysts — of a colloid having been shown to act specifically as a catalyst is the production of hydrazine from ammonia, by the action of a hypochlorite, by Raschig's method, an interaction which is promoted by the addition of glue,
the amount produced being thereby much increased. In this instance, the catalytic effect may well depend upon the intermediate formation of a protein chloramine.

It is desirable here to call attention to certain peculiarities in the behaviour of enzymes which merit consideration in view of their action being that of particular agents. When submitted to the action of the enzyme urease—best used in the form of an extract of the soya bean—according to the amount of enzyme used, urea, for example, is rapidly hydrolysed, at a diminishing rate as the action proceeds. Contrasting the effect on a solution of moderate strength with that on a concentrated solution, it is noteworthy that the amount changed is considerably less in the latter: thus in an experiment in which gramme-molecular (6%) and five-gramme molecular (30%) solutions were contrasted, at the end of 10 hours, the ratio of the amounts of acid required to neutralize the ammonia formed was as 55 in the case of the stronger 10 to 12 in that of the weaker solution.

Proof that the diminished activity of the enzyme is the consequence of the increase in the concentration is given by the observation that, if methylurea be, in part, substituted for urea, the amount of the latter hydrolysed is less than in the absence of the methylurea. Methylurea is not in the least affected by the enzyme, this being strictly selective in its action, attacking only urea, none of its derivatives.

Special reference is made to these observations as showing that in the case of catalysts generally the conditions at the surface cannot be considered independently of those in the medium. It is, however, to be noted that, even in simple solutions, in the case of Interactions taking place under the influence only of determinants—in the absence of a catalyst, as defined in this article—the rate of change is not proportional to the concentration. This is seen at a glance on reference to the accompanying graph (fig. 3) representing results obtained on hydrolysing cane-sugar with nitric acid, the sugar being the only variable. Such variations are certainly due to reciprocal variations in solvent and solute as the concentration is changed.

![Molecular Proportions of Sugar](image)

**Fig. 3. Molecular Proportions of Sugar.**

It is known that absorbents take up relatively more of a substance from dilute than from concentrated solutions. That the condition of “water” at a surface differs from that in the main body of the liquid seems also to follow from the observation that wet paper does not stiffen until the temperature is reduced to about 0°— and that the water in a clay sphere does not freeze until −0.7°. The observation made by Adrian Brown and Tinkler, that when barley corns are steeped in a 50% solution of acetic acid, the absorbed liquid ultimately in equilibrium with that outside the corn contains 80% of the acid, would seem to show that the “water” of the thin film distributed over the surfaces of the starch granules is more active than ordinary water. Substances so diverse and different from acetic acid as aniline and phenol behave in a similar way, accumulating in the capillary spaces. In the enzymes which act on carbohydrates, not only is the rate of change diminished by foreign substances generally but those which resemble the hydrolyte in structure exercise a retarding influence far in excess of neutral materials. Thus the hydrolysis of the glucosides, whether α or β, is specially retarded by glucose, but not nearly to the same extent by the isomeric galactose. If the argument advanced above that the enzyme must fit the hydrolyte be accepted, it is obvious that a substance which could also be fitted upon the enzyme will necessarily interfere more with its activity than would a substance whose interference would be merely mechanical—by getting in the way—or that of a solute modifying the osmotic condition. A special interference with enzymes and with other catalysts which function chemically, not merely as surface condensing agents, may arise through the neutralization of the functioning radiicle; hence perhaps the great influence of acids and alkalies. The accompanying graph illustrates the behaviour of urease when subjected to the action of the enzyme alone or in presence of either one or one of the products of change. Hydrolysis is retarded by the weakly alkaline mixed product of change. Taking the products separately, the more strongly alkaline product ammonia has a still greater retarding influence; on passing carbon dioxide into the solution, however, so that it is present in excess, the action of the ammonia is held more strongly in check and the action is greatly accelerated.

In the case of urea, under the influence of the enzyme, the interaction is complete—there is no reaction or reversal. This is theoretically wrong. Cane-sugar behaves similarly. In other cases, an equilibrium point is reached and the enzyme will act reversibly in a solution—if it be sufficiently concentrated—of the products of change, reforming the hydrolyte.

Thus α and β methyl glucosides are resolved into methyl alcohol and glucose by the enzymes maltase and emulsin respectively; the resolution appears to be complete in dilute solutions but is less and less so the more concentrated the solution; and if a mixture of methyl alcohol and glucose in water be submitted to the action of either enzyme, the appropriate glucoside is reproduced in proportion to the concentration.

The behaviour of a fatty oil (olive oil) in presence of the enzyme lipase affords a particularly striking illustration of the manner in which change in the two possible but opposite directions is balanced as the conditions are varied. On reference to the accompanying graph it will be seen that as the amount of water present is increased the amount of fat hydrolysed is increased; as the fat and the fatty acid are insoluble, it is to be supposed that the water acts by diluting the glycerol and it will be noted that, if glycerol be added, the extent to which hydrolysis takes place is diminished.

The reason why urea and cane-sugar are not reproducible from the final products of change by the respective enzymes is not clear; it is not improbable that the final are not the initial products and that the initial products have but an ephemeral existence in solution: some link in the chain of change is lost by the occurrence of an action outside the range of the enzyme.

Urea is known to undergo change reversibly in solution into ammoniacal cyanate: \( \text{CON}_2 \text{H} \equiv \text{NH} \equiv \text{NCO} \). The proportion of cyanate present at ordinary temperatures is known to be very small; it is slightly increased by boiling the solution; if silver nitrate be added, which serves to fix the cyanate as insoluble silver cyanate, an almost complete conversion can be effected.
No evidence of the production of cyanate during the hydrolysis of urea by urease has been obtained.

It is of interest that, whereas ammonic thiocyanate can be destroyed by bacterial action, thiourea cannot; this compound is not known to undergo change in solution.

Before leaving the subject of catalysts, the rusting of iron may be referred to as a case in which the action is influenced by a particulate agent. The subject is one of perennial interest and it is strange how slowly the nature of the process is appreciated. It must be electrolytic; the metal is attacked primarily in a circuit comprising the electro-negative conducting impurity present in all iron and the electrolyte on its moist surface, usually carbonic acid, the product being a soluble ferrous salt. If this salt remain at the surface, it necessarily undergoes hydrolysis yielding ferrous hydroxide, which is deposited as solid and sooner or later oxidized to a ferric hydroxide. J. A. N. Friend has recently advanced a “colloid theory” in explanation of the process. He shows that in moving water there is little rusting, though the iron is slowly dissolved—as must be the case on the above view. He considers that the ferric hydroxide precipitated on the surface under still conditions acts catalytically, by oxidizing metallic iron with relative rapidity and simultaneously undergoing reduction to a lower hydroxide, etc. It is well that this effect of once formed rust should be insisted on; but it stands to reason that it should act as an accelerator, by promoting, through the surface action of its fine particles, the condensation both of electrolyte and of oxygen, whether or no it act itself and be alternately reduced and reoxidized.

The part played by the determinant in gaseous interactions has yet to be appreciated. The results obtained by Bone and his co-workers at high pressures are specially significant. When a mixture of hydrogen and oxygen, diluted with nitrogen, is exploded, the pressure rises to a maximum almost immediately; if methane or carbonic oxide be burnt in place of hydrogen, the pressure developed rises to a maximum only gradually. The process of change must be far more complex in the latter cases. The slowness of the change, in carbonic oxide, may reasonably be ascribed to the prior conversion of the oxide into formic acid ($\text{CO} + \text{OH}_2 \rightarrow \text{H}_2\text{CO}_2$) before it is burnt (cf. Trans. Roy. Soc., 1915, A. 215, 275).

Whatever the phenomena considered, if the view be taken that chemical change is essentially an electrolytic process, conclusions such as have been formulated cannot be avoided. The process, in the main, is the same in all cases. The “determinant” is the cause of change; when a catalyst is present, the rate of change is greatly accelerated, owing to the concentrating effect this exercises; maybe, in some cases, the catalyst is required together with the determinant to constitute a conducting circuit of the interacting materials.

It is strange that the action of the determinant is so much overlooked. Recent observations by H. B. Baker show that its influence is to be considered even in cases of chemical change not ordinarily regarded as such—the evaporation of liquids. Long ago it was proved by him, that not only do hydrogen chloride and ammonia not interact when dry but that the product of their interaction, ammonium chloride, does not decompose so readily, when heated, if dried. He now finds that as liquids, such as benzene and bromine, are rendered more and more nearly dry, the boiling point rises and at the same time the weight of the molecules in the liquid gradually increases. Strange to say, when shaken with water, the polymerized benzene only slowly passes back into the simpler state.

As the phenomena of chemical change are more and more closely examined into, the conviction grows that molecular structure and affinity are the determining causes; to correlate these with the electronic structure of the constituent materials is the difficult task of the coming generation. Why is carbon so entirely peculiar an element? What has oxygen so remarkable an influence on the development of acidic qualities? An endless series of such questions may be asked. They must be answered in terms to satisfy the chemist—to satisfy his dynamic as well as his structural cravings, and to explain the many variations in function which follow from variations in composition.

A revolt is now setting in against the tendency to accept purely physical interpretations of chemical phenomena, which has so long been prevalent and has too often led chemists to overlook the complexity of the conditions prevailing in solutions. As a result, undue importance has been attached to mathematical agreements which it is clear have but served to give colourable expression to the facts; and the minute and penetrating analysis
to which phenomena should be subjected has been unduly discouraged. For example, the apparently physical phenomena of lubrication have been reduced by the observations especially of W. B. Hardy and of Langmuir to terms of chemical structure and of function as determined by molecular structure. A single layer of molecules is sufficient to cover and cloak a surface—a matter of importance to be borne in mind in considering the action of catalysts—and the disposition of the molecules is determined by their structure. Thus the spread of a liquid upon water is determined by the affinity of the substance for water but this is a localized function of its structure. Langmuir’s measurements show that, in the case of the complex fatty acids, the affinity of the small structural units, the carboxyl groups “dissolved” or dipping down into the water, the complex hydrocarbon group sticking up much as does a fisherman’s float. Molecules so placed, ranged side by side in piles, would present an upper surface composed of the terminal methyl groups (CH₃).

W. B. Hardy’s measurements show that the lubricating effect of substances is definitely a function of molecular structure; it therefore varies with the nature of the surface to which it applies, as both the affinity of substance to surface and intermolecular affinity are functions of the structure of the substances. Much has been done of late, especially by Jacques Loeb, to show that chemical conceptions can be applied in explanation of the peculiar “physical” properties of colloid materials and that the behaviour of these is comparable with that of crystals when determined under proper conditions. The passage of colloid materials from the dissolved to the undissolved particulate state and the accompanying changes are certainly matters to be considered from the point of view above explained.

Most irregular results have been obtained by several workers who have studied the effect of different acids on various properties, such as viscosity and electroefficiency, by passing solutions of gelatin or egg albumin; as a rule, acids have been used in equivalent concentrations, without taking their relative efficiencies into account. Loeb has shown that there is no difference in the effects of a variety of acids when the solutions of the protein acid are of the same acid efficiency (the same pH value) and the same concentration of the originally isoelectric protein. The same is true of alkalies. The proteins exist in three states, by derivation from the aminocarboxylic-acids: either the molecule may be neutral or it may be either acidic or basic. Thus, if brought into contact with gelatin at pH 4.7, gelatin is neutral; but at pH < 4.7, it forms an acid salt, whilst at pH > 4.7, a metallic salt is formed.

Not only are more precise conceptions of the behaviour of colloids being formed by such studies but light is also being thrown on the characters of the acids. W. B. Hardy, in 1907, pointed out that the solvent power for globulin of strong and medium acids is measured by the number of gramme-molecules present, not by the number of gramme equivalents. He wrote HCl = H₂SO₄ = H₃PO₄; adding, “very weak acids have a lower solvent power—HCl = 5H₂SO₄ = 5H₃PO₄. These relations are explained by the very weak basic functions of globulin.” Loeb has obtained results of the same order. Using gelatin and egg albumin, he has found that most acids act as monobasic molecules—not only phosphoric acid but also the organic dibasic acids, succinic and tartaric, even tribasic acid; oxalic acid, however, was intermediate in behaviour between the mono- and dibasic acids; sulphuric acid was definitely dibasic, serving to couple two molecules. That oxalic and the other organic acids should act as monoacids sulphuric.

The whole question of effective acidity is one requiring further study—it may be questioned whether any inorganic acid be more than monobasic in the proper sense of the term.

Benzenesulphonic acid (C₆H₅SO₃H) and similar acids have about 90% of the hydrolytic efficiency of sulphuric acid; it would therefore seem probable that this acid is to be regarded as an unsymmetrical hydroxysulphonic acid rather than as

\[ \text{SO}_3^\text{OH} \quad (\text{cf. Proc. Roy. Soc., 1914, 90, 73}). \]
CHEMISTRY

remarkable ease. Ammonia is obtained by subjecting the cyana-
mite to the action of steam.

Calcium carbide, it should be added, is made on a large scale
as a source of the gas acetylene (CaC₂ + H₂O = C₂H₂ + CaO),
now so much used as a lighting agent for road-traction purposes
and even for domestic lighting away from towns; but chiefly,
together with oxygen, in the form of the acetylene blowpipe,
in cutting iron plates in the shipbuilding and other trades, in
joining iron rails for the electric tram service, etc.

The production of nitrogen for the above-described processes
and of oxygen has been greatly promoted by the researches on
the liquefaction of gases carried out by Sir James Dewar, at the
Royal Institution, Albemarle Street, London, the home of Davy
and Faraday. The metallic vacuum vessels invented by this
indefatigable student of low-temperature phenomena have made
possible also the use of liquefied air, richer in oxygen than air,
in various ways—in hospitals, for example; also, together with
charcoal, as an explosive agent, in mining operations.

The astounding power properly prepared charcoal has, at
liquid-air temperatures, of absorbing gases, another discovery
made by Sir James Dewar, is proving of the greatest value in
operations involving the separation and purification of gases.
It is even contemplated that it may be possible to fill airships
with the incalculable, rare gas, helium, prepared by taking
advantage of this property of charcoal—the source of the helium
being the natural gas associated with petroleum, in the American
oil wells and in certain springs in Canada.

To return to the nitrogen compounds, the outstanding impor-
tance of ammonia and nitric acid will be understood when it is
realized that cereal crops, including the sugar cane, cannot be
grown without nitrogenous fertilizers. At Rothamsted, where
wheat has been grown on the same land year after year under
the same treatment since 1852, the average yield of grain has
been only 12-9 bushels per acre on the permanently manured
plot; whereas on the plot properly supplied with nitrogenous
manures, it has been 31-6 bushels.

Now that both ammonia and nitric acid can be produced,
by synthetic means, in any desired quantity, the world need
have no anxiety as to the supply of artificial nitrogenous manures.
Even if fuel should not be available to supply power, their
manufacture will always be possible where water-power is to hand.

Large quantities of ammonium nitrate were made during the
war, for use in admixture with trinitrotoluene as a high explosive.
Sulphate of ammonia and nitrate of soda are both only of partial
value as fertilizing agents, as the one necessarily contains excess
of acid and the other excess of alkalies; these remain after the
nitrogenous effect is exhausted; also the constant use of the
sulphate involves a steady withdrawal of lime from the soil,
ultimately rendering it acid, whilst the tendency of the alkalies
from the nitrate is to make the soil impervious to water. Of late
years, there has been a gradual growth of opinion, therefore,
in favour of ammonium nitrate, as this combines in itself the
activity of an ammonium salt with that of a nitrate and, being
used up entirely in the service of the plant, has not their harmful
effect upon the soil. The objection to the use of the nitrate is its
tendency to liquify on exposure to a moist atmosphere and that it
sets to a hard mass; moreover, it cannot be transported in bags.

The Germans have foreseen the value of urea, CON₂H₄,
which is free from the disabilities associated with the nitrogenous
fertilizers now in use. It is an entirely neutral substance and is
undoubtedly an effective fertilizing agent under some conditions
but it has yet to be shown that it could be used generally in place of
the more abundant salts and nitrates. It can be made merely
from ammonia and carbonic acid, so that if this manufacture can
be put upon an economic footing and it prove to be suitable at
least for most purposes, though it may not supersede ammonium
salts, it may largely displace them from use.

Other methods of exploiting nitrogen are being studied which
involve the direct absorption of the gas and its conversion to a
cyanide; it is well within the bounds of probability that these
may ultimately prove equal, if not superior, to the highly mechani-
cal methods now coming into vogue: these latter, however, will
have the advantage that they can be carried out with the aid of
water-power, unless the fixation methods should also be such as
to necessitate the use of electric power.

More natural processes are also in sight. It is now customary,
in most civilized countries, not only to waste the excrata of
the urban populations but to do so at considerable cost. In the East,
In China especially, human excreta are most carefully collected
and used on the crops; they are actually a source of revenue to
one or more towns. An activated sewage sludge process is
coming to the fore which may be of service under European
conditions: whether this will do more than conserve nitrogen is a
question; if also the waste of phosphate can even be partially
prevented, infinite service will be rendered. The chief limiting
factor of agricultural production in the near future will clearly
be the supply of phosphate and in the next degree of potash; we
now know how to bring down nitrogen from the air but the
supplies of phosphate and of potash are being drawn upon
at exorbitant rates and must ere long be exhausted; no ways of
withdrawing them from the vasty deep, which can be put in
practice, are before us. It is found that at least the solid matter
in sewage can be recovered in a valuable form by forcing air
into the fresh liquid; when this operation has been repeated
several times, first forcing in air, then allowing the suspended
solid to subsidence, running off the liquid and adding fresh sewage,
the sludge acquires a greatly enhanced bacterial activity and
apparently even nitrogen-fixing organisms come into activity;
eventually it may contain 6 to 7% of nitrogen and become equal
to farmyard manure in value.

The amount of farmyard manure now available is insufficient,
as the number of horses kept is so much less than formerly.
Recent inquiry has shown that a complex series of changes
is involved in the production of this manure from the straw
and animal exuviae of which it is composed and that eventually
it may contain a considerable amount of nitrogen beyond that
originally present in the raw materials. Organisms are at work
which destroy much of the carbonaceous matter but, in the course
of the operation, they induce the fixation of a certain amount
of atmospheric nitrogen, if supplied with the nitrogenous food
they require for their own development. It is therefore conceivable
that an economic process may be developed of manufacturing
farmyard manure from waste carbonaceous materials with
the aid of ammonia. The development of greatest importance in
agriculture, however, to which we may look forward, is the direct
enrichment of the soil with nitrogen, directly withdrawn from
the atmosphere: either by means of organisms functioning in
immediate association with leguminous crops; or by organisms
within the soil, whose activity is promoted by the judicious use
of green manures. No branch of scientific inquiry is of greater
importance to mankind than studies to promote such ends.

The soap industry has undergone marked development of
late years, owing to the increasing consumption of margarine
as a substitute for butter. As the hard fats are required for the
manufacture of this material, it has been necessary to make
use of the natural fatty oils in soap-making; these differ from
the hard fats in that they are glycrides not of saturated but of
unsaturated fatty acids. To harden them, i.e. to convert them
into glycrides like those contained in the ordinary solid fats,
the heated oils are subjected to the action of hydrogen gas
in presence of finely divided metallic nickel, which acts as a catalyst.
The process is now carried out on a very large scale.

In the metal industry, the developments have been in matters
of detail. Aluminum, nickel, tungsten and sodium have been
brought greatly to the fore. One of the most notable achieve-
ments of the past ten years has been the production of molyb-
denum and vanadium. The molybdenum, which will bear sharpening when made into knives;
apparently the special qualities of the steel are the outcome of a
particular structure developed by heat treatment, though
why the alloy should be rustless is not clear.

As illustrations of the manner in which the rarer inorganic
materials are gradually being imported into industry, reference
may be made to the use of vanadium oxide as an oxidizing cata-
lyst; of titanium oxide as a white paint—on account of its high
refractive power; and of cerium alloyed with iron—in substitution for the old flint and steel in kindling fire.

Marked progress has been made in devising synthetic methods of manufacturing some of the simpler carbon compounds heretofore obtained only from natural products. Thus formic acid has been prepared, on a considerable scale, by combining carbonic oxide with caustic soda, under pressure—one of the earliest syntheses effected by the French chemist Berthelot.

Acetylene, another discovery of this chemist, has been converted into alcohol, on the large scale, by processes also due to his acumen, by passing acetylene, prepared from calcium carbide together with hydrogen over a suitable catalyst thus producing ethylene, \( \text{C}_2\text{H}_4 = \text{C}_2\text{H}_2 + \text{H}_2 \); then absorbing the ethylene in sulphuric acid of suitable strength and distilling with water, to hydrolyze the sulphate that is formed \( \text{C}_2\text{H}_4 + \text{H}_2\text{SO}_4 = \text{C}_2\text{H}_5 \text{HSO}_4 + \text{H}_2\text{O} \). The process is said to have been an economic success, in Italy, where water-power is available. The process has also been carried out experimentally with coke-oven gases as a source of ethylene.

During the war, much acetic acid was made from alcohol by first converting this into aldehyde and hydrogen, by passing the vapour over heated copper; then oxidizing the aldehyde by means of air, in presence of a manganese salt. Acid so made is of better quality than that from crude calcium acetate. Acetic acid has also been produced by oxidizing aldehyde prepared directly from acetylene, through the agency of sulphuric acid acting in conjunction with muriatic and ferric sulphates; oxygen diffuses from the outside of the vessels and has been introduced by the liberating gas of the process. The cost of acid prepared in this way, in one of the chief German works, in 1915, is stated to have been £0.50 per ton. The importance of acetic acid is now far greater than it was, owing to the use that has been made of it in preparing varnishes or dopes for airplane cloth. The attempt is also being made to develop the manufacture of artificial silk from acetylene
cellulose.

The manufacture of explosives has involved various other developments. Prior to the war, the aceton used as a solvent, in making the propulsive cartridge—a mixture of the trinitrates produced on superphosphating glycerol and cellulose—was obtained by the dry distillation of calcium acetate, this being made from the crude acid which is obtained, in carbonizing wood, together with wood spirit or methyl alcohol. When a shortage of the supply of acetone was imminent, two new methods of making acetone were developed—one involving the passage of acetic acid vapours over heated alumina (2CH\(_3\)COOH = CH\(_2\)CO. CH\(_3\) + CO\(_2\) + OH\(_2\)); the other the fermentation of glucose by a special organism giving rise to a mixture of acetone and normal butyl alcohol. Success was found to depend on the use of a pure organism and at first much difficulty was experienced in sterilizing the large bulks of liquid used: two of the organisms were not killed until the temperature was raised to 130°.

Acetone was originally used in making cordite, because it is a solvent of cellulose trinitrate. Another way of overcoming the difficulty, created by the shortage of the solvent, was found in the use of a less nitrated cellulose, soluble in a mixture of ether and alcohol. This departure involved the manufacture of ether not by a new method but on an unprecedented scale, without any difficulty. Another substance made on a scale which might previously have seemed inconceivable was hydrogen cyanide or prussic acid. Experience showed that any desired substance may be made on any desired scale, putting economic cost aside.

Ullmann, glycerol has always been obtained from natural fats, usually as a by-product of the manufacture of soap. It is a constant product of the fermentation of glucose by yeast in the brewing process, although only about 3% of the sugar used takes this form. Experiments carried out in America and Germany, during the war, showed that the proportion might be raised even to 20% by carrying on the fermentation in presence of an alkaline sulphite or carbonate. If needs were, therefore, glycerol might be manufactured from starchy materials.

A point of interest in connexion with explosives was the use during the war, for the first time, of Borneo petroleum as a source of much of the toluene required for the manufacture of trinitrotoluene (TNT). Previously, toluene had been obtained only from coal tar. The presence of this and similar hydrocarbons in petroleum was first noticed by Hugo Müller and Warren De la Rue. The complete nitration of toluene to TNT is a matter of some difficulty. As proof of the value of scientific insight and the practice of a rigid scientific method in manufacturing industry, the fact may well be mentioned here that the most efficient British works for the production of this explosive, although only a small one, in point of quality of product and cost of production, was one established, at a very early date, by a Scotch professor and a young colleague versed in physical chemistry.

The explosive picric acid or trinitrophenol was also made on a large scale, not only from phenol extracted from coal tar but also from synthetic phenol, prepared by sulphonating benzene and fusing the sulphonate with caustic soda: \( \text{C}_6\text{H}_5\text{SO}_3 \text{Na} + \text{H}_2\text{O} = \text{C}_6\text{H}_5\text{SO}_2\text{H} + \text{Na}_2\text{SO}_4 \). In England and France the old, barbaric, wasteful process of nitrating the phenol was unfortunately followed and the manufacture was never put on a scientific footing. A substantial amount was made, however, by a very superior process, involving the conversion of benzene, \( \text{C}_6\text{H}_6 \), first into chlorobenzene, \( \text{C}_6\text{H}_5\text{Cl} \), then into dinitrochlorobenzene, \( \text{C}_6\text{H}_5(\text{NO}_2)_2\text{Cl} \), next into dinitrophenol, \( \text{C}_6\text{H}_5(\text{NO}_2)_2\text{OH} \), finally into trinitrophenol, \( \text{C}_6\text{H}_5(\text{NO}_2)_3\text{OH} \). The operations are all carried out with extreme ease and except the first afford all but quantitative yields.

Many substances were made for the first time on a large scale during the war, and used as "poison gases" and to excite weepiness. One of the most remarkable of these was mustard gas, prepared by "chlorinating" picric acid, in presence of soda. The one which became of most consequence, the so-called poison gas, really a by-name easily volatilized liquid, was always manufactured by the Germans by a rather involved process devised by Victor Meyer, which was never brought into operation, in an effective manner, elsewhere than in Germany. Shortly before the Armistice was declared, however, a far simpler method was developed, in England, which involved merely chlorinating sulphur and then passing ethylene into the chloride:

\[
\text{C}_2\text{H}_5\text{Cl} + 2\text{C}_2\text{H}_4 \rightarrow \text{C}_2\text{H}_5\text{Cl} + \text{C}_2\text{H}_5\text{Cl} \rightarrow \text{S-Cl}
\]

Very large quantities had been prepared for use in the field, just before the war came to an end. No difficulty was experienced in preparing any desired quantity of ethylene, by heating alcohol with phosphoric acid.

Two substances have acquired importance, the one as a detonator, the other as a primer in starting the ignition of the less sensitive TNT, lead azide, \( \text{Pb}(\text{N}_3)_2 \) and trinitrophenylmethyl nitramine, \( \text{C}_6\text{H}_5(\text{NO}_2)_2\text{N}-(\text{CH}_3)\text{NO}_2 \). The former has the advantage that it is stable under the high temperature conditions of the East, where mercuric fulminate, the detonator commonly used, cannot be kept long. Prior to the war, the acid \( \text{HNO}_3 \), from which the azide is made, was little more than a chemical curiosity and almost feared on account of its instability. The nitramine referred to was made preferably from methylamine but chiefly from dimethylamine, two substances much used in the dyestuff industry.

Attention has been directed very frequently, of late years, to the production of a substitute for indiarubber. Thus far the German manufacturers have not been able to control the final stage of the process, that by which the simple hydrocarbon used initially is converted into the rubber complex. The "polymerization" is effected only gradually and at a slow rate; in fact, the material is merely placed in hermetically sealed barrells and allowed to remain undisturbed, during six months, at about 32°C, the rubber being finally obtained as a white spongy mass which has to be bored out of the barrels. The minimum cost of production appears to have been about 18s. per pound. The Germans went so far, however, that they organized the manufacture on the scale of a possible output of 1,000 tons per month.

The opinion that prevails is that the process cannot under any conditions be an economic success, until it can be controlled and much accelerated; it is dangerous to assume that this will
not be done. Moreover, the attack on the rubber trees by fungoid pests is becoming so serious and the conditions of growth are so special, if not unnatural, that the future of the "natural" industry cannot be regarded as established and secure; it may well suffer the fate of the coffee plantations in Ceylon. The direct vulcanization of rubber, it may be mentioned, is now effected, in a most ingenious manner, by subjecting the material to the action of sulphured hydrogen and sulphur dioxide gases, the sulphur-vapour sulphur being produced in situ by their interaction.

In the great dyestuff industry, the developments have been mainly in the direction of improvements in the manufacture of the intermediate materials and in the use of by-products as substantive agents; the tendency has been to aim at the production of dyestuffs of ever-increasing fastness, that is to say, able to withstand light, soaping and the bleaching agents so largely used in cleansing fabrics. To cite an instance of progress in the making of materials, phthalic acid is now produced by merely passing the vapour of naphthalene mixed with air over a heated catalyst—vanadium oxide—instead of by the uncertain and trol'esome method of heating with sulphuric acid and mercury. The most notable advance in the manufacture of dyestuffs is the use particularly of the hydrocarbon anthracene, the parent of the madder dyestuffs, in the production of a series of pigments known as vat dyestuffs; one of the latest of these is a green, in many ways superior to the green dyestuffs hitherto known. Like indigo, these are reduced, in the dyer's vat, to a soluble state, by means of sodium hydrosulphite; when the cloth has been impregnated with the solution and it is exposed to the air, the reduced material becomes oxidized and the dyestuff is deposited within the fibre. The really serious rival of indigo, in the future, may well be one of these dyestuffs, indanthrene, which is a magnificent blue considerably superior to indigo in fastness. The contention that natural dyestuffs are superior to the artificial is now disproved in a multitude of cases.

In addition to indigo, a variety of indigoid dyestuffs, similar in constitution to indigo, including derivatives of this latter compound, are now in use, differing from it in shade of colour. Indigo, the product of various species of indigofera, has never been made artificially: only its chief pigmentary constituent, indigotin, is manufactured. Synthetic indigo, is now largely used, especially in calico printing; it is of particular value in dyeing light, clear shades of blue. These cannot at present be secured with the aid of indigo; but the natural product is now known to be superior for heavy shades on wool (blue serge, etc.), owing to the presence of other dyestuff constituents, together with indigo. Much has been done during the war to re-establish the indigo industry in India. If scientific findings be accepted, provided the commercial side of the problem be properly handled, indigo may well resume the place it had lost as a dyestuff, though it can never attain to exclusiveness.

One important development in this field is to be chronicled. In photographic chemistry, which has long been at a standstill, there has been a notable advance, particularly in the all but complete control secured over the colour sensitiveness of the photographic plate. When the necessity arose, the required staining materials were produced in English laboratories without any difficulty and a command of the problems of staining has been secured far beyond that of the Germans.

Astonishment has been created by the discovery that certain stains (notably pheno safranine) so diminish the sensitiveness of the gelatine-bromide emulsion to light, that if the most sensitive of plates be exposed, then placed during a brief period in the solution of the stain, development afterwards may be carried out in the weak light of an ordinary candle.

A great new field on the verge of development is that of the carbonization of coal at low temperatures, with the object of conserving the gaseous and oily products that are burnt wastefully when it is used directly as a fuel, as well as of obtaining a solid fuel, of higher efficiency than coal, which can be burnt without producing smoke. The long-discredited process of making illuminating gas for domestic use by merely distilling coal must soon be superseded by rational methods, especially as the demand for gaseous fuel is increasing very rapidly. The change will involve the disappearance of gasworks tar, so that the dyestuff industry will be forced to rely upon the high temperature cokeing ovens for its raw materials—or discover other sources of supply; the use of tar on roads will also be diminished. The development of a synthetic process to convert a mixture of carbonic oxide and hydrogen into methane may well prove to be of importance in this connexion. It is known that the conversion knowledge of the chemical difficulties, using nickel as a catalyst; but the process has yet to be developed on an economic scale. The successful use of nickel as a catalyst, in purifying coal gas from sulphur (other than as sulphured hydrogen), may be referred to as another striking instance of industrial advance.

A wave of scientific method is pulsating throughout the world, which is everywhere influencing industrial development. There is an obvious desire to assimilate the procedure of the works with that of the scientific laboratory and particularly to develop the use of machinery in the former; but if empiricism be departing, progress is at very different rates, not only in different lands but in different industries, some being very slow to move. The chemist of the future, to carry the burdens of his day and succeed, will need be both very widely trained and gifted with reflective power and insight: victory must fall to the scientific rather than to the strong or the swift.

Progress in Organic Chemistry.—It is necessary to clear what the expression "Organic Chemistry" should cover. As a philosophy, at the present time, chemistry is in a difficult position owing to the extent of the field, the over-subdivision of the subjects and the ever-growing tendency of workers to specialize, knowledge of facts having been multiply cultivated at the expense of breadth and precision of scientific outlook. Looking back to one of the earliest of his celebrated Letters on Chemistry, "The attaching too high a value to the mere facts is often a sign of a want of ideas. It is not fertility, but poverty of ideas which clothes itself with a mass of coverings of all sorts or wears old, battered, threadbare and ill-fitting garments." It is to be feared the criticism holds to-day.

The science of chemistry is conventionally divided into two main sections—the inorganic and the organic; but these are most unfortunately defined. Substances derived from plants and animals thus thought under, and, to some extent a vital force—were originally the subject matter of organic chemistry. When the discovery was made that such substances could be prepared by artificial means—first in 1828, when Vöhler synthesized urea—organic chemistry became the study of the compounds of carbon: though the systematic definition was a gain of precision, the chemist's outlook was narrowed and confined, as attention was withdrawn from the concurrent study of vital phenomena. A more unfortunate consequence of the rigid subdivision of the field is, that the two branches have been treated as separate disciplines; usually the carbon compounds have been regarded as the subject mainly of higher academic and professional study, so that those who have sought to acquire only an elementary understanding of chemistry have been denied the very knowledge likely to be of most importance to them. The study of carbon compounds has been prosecuted with extraordinary diligence, during the past 50 years, by a large number of workers who have been attracted by the beauty of the problems the subject affords and the consistency of its methods. An astounding fabric of structure has been reared which is all but unknown, except to the few; and yet it is laid upon the simplest of foundations and its main features and lessons are easily grasped. No one can claim to be a chemist who is not seized with the spirit of this knowledge.

The study of structure has played little if any part in inorganic chemistry and until recently this branch attracted relatively few workers; it has further suffered, not only from neglect to apply the lessons to be derived from carbon compounds but owing to its own subdivisions—through the treatment of metals under metallurgy, as a separate subject. Of late years subdivision has been carried still further, by the creation of a physical section of very limited range, as something apart; the attempt has
even been made to treat "colloids" as a separate branch. To make chemistry of avail some change of attitude is desirable. The prime need of our time appears to be that we should recognize the essential unity of chemical science, in order that we may teach the fundamental principles and the syntactical issues as a single discipline. The characteristic of organic chemistry has been the attention paid to the determination of molecular structure and to that of function, both chemical and physical, as an outcome of structure; too little attention has been paid by the inorganic chemist to these issues. It is essential that the conception of structure and the methods followed in determining structure in the case of the simpler compounds of carbon should be brought before the student at an early stage.

Cessing to draw the invidious distinction now made by classing carbon apart, mainly because this element has so numerous a progeny, we shall with advantage treat each of the great family groups of elements as a separate stock or tribe, but take into account the graded interrelationship of families and the effects of unions between their members.

No science can work alone. The chemist in future will be associated either with the physicist or with the biologist, if not with both. In conjunction with the former, he will extend his studies of structure and function into atomic regions: the quest is one that seems to need the mathematical habit of mind. He will cooperate with the latter by applying his knowledge of molecular structure and function to the explanation of the living mechanism and of its activities as functions of structure—even in extending that to the mind of this field the mathematical habit of mind seems to be a matter out of place.

We may anticipate, wrote Liebig, more than 70 years ago, that from organic chemistry the laws of life—the science of physiology—will be developed. It is in this sense that we need to raise up a science of organic chemistry in future—the organic chemist must once more be the proclaimed student of vital phenomena, not merely of materials. The two outstanding exponents of the art thus defined have been Liebig himself and Pasteur, the one having rendered supreme service by his general prescience, the other by demonstrating the essential interdependence of chemical and vital phenomena.

The great lesson we have thus far learnt is that the activity of nature is of a circumscribed character, far more so, in fact, than is that of the chemist in the laboratory. At some time choice has been made of particular types of material and definite lines on which alone action may proceed have been laid down. Nature has learnt to wear only a single glove: all living things are essentially composed of one-handed (asymmetric) materials. The controversy long waged over spontaneous generation must be regarded as futile, in face of this conclusion. Whether the lines of action in nature are innate in the primary materials used, time alone can show. The chemist is tempted to think that this may well be, as within his own field of operation he finds that the structural possibilities are more definite in character and relatively few in number. The underlying policy of nature would seem to be the repetition of units of a simple kind. Tennyson has summed up the situation in the line—

So careful of the type she seeks,
and Pasteur, in the more definite comprehensive phrase, La vie est dominée par des actions dissymétriques.

Apparently the destinies of life are determined by the element carbon, which is distinguished from all others not merely by the multiplicity of its compounds but by their relative stability—a stability, however, which is accompanied by remarkable plasticity. If there be life elsewhere, it can scarcely be very different from ours—carbon seems to be the only possible nucleus element, the only one which can give rise to combinations imbued with the necessary stability and also sufficiently reactive.

Next to carbon, water is the factor of primary importance. The operations of dehydration and of hydration play the determining part in the constructive process; next to these come those of oxidation and reduction, which are but the separated activities of those of hydration or its reverse.

The level of energy is raised by oxidation; it is gradually lowered by successive "hydrations," as in the process of fermentation. Whilst the chemist is frequently forced to resort to high temperatures and high electromotive forces to produce his result, nature does most of her work at a low energy level. In only one operation is she helped by a transcendent, irresistible power—that of solar radiations of short wave length: but this is the first step in life and the energy taken in at this stage must suffice in all subsequent acts, as even that derived from oxygen is to be thought of as stored up in the same operation; the separation of the oxygen from the natural system carbon dioxide plus water, now with the aid of chlorophyll but primarily through some simpler agency. Nothing is more wonderful than the silent, steady way in which the glucose, formed at the expense of the carbon dioxide present to the extent of only three ten-thousandths in the air surrounding the plant, is built up underground, in the dark and at atmospheric or a lower temperature, into starch—
as in the potato tuber, for example. In no way can the chemist imitate the act. Selective and directive influences are clearly at work: we have reason to believe that these are to be found in an enzymic mechanism.

The observations made, of late years, on the formation of minute amounts of formaldehyde and even of glucose on exposure of solutions of carbonic acid to rays of short wave length, are of little if any assistance in enabling us to follow the natural process. A complete mechanism is provided in the chlorophyll system but what this includes we do not know. The suggestion has been made that there is a factor at present unknown, as assimilation (measured by the amount of oxygen liberated) is less active in leaves brought into light when only a few days old than in leaves equally greened several days older.

Of chlorophyll itself much is now known. So long ago as 1864, the late Sir George Stokes came to the far-reaching conclusion that the chlorophyll of land plants is a mixture of four substances, two green and two yellow, which by proper treatment may each be obtained in a state of very approximate isolation. Most of the chemists who followed him succumbed only in isolating decomposition products, but Willstätter, who took up the inquiry in 1906, has shown that the inference of the great physicist was correct. He finds that all green plants contain Chlorophyll a, blue-black, in solution green-blue C_{55}H_{70}O_{5}N_{4}Mg Chlorophyll b, green-black, in solution pine green C_{55}H_{70}O_{5}N_{4} Mg Carotene, orange-red crystals C_{41}H_{62} Xanthophyll, yellow crystals C_{40}H_{64} O

The brown alga contain a third yellow constituent, fucoxanthin C_{49}H_{64}O_{3} though a very small proportion of b chlorophyll. The pigment of the ripe tomato is an isomeride of carotene, lycopin. Egg-yellow is coloured by an isomeride of xanthophyll, and the red of the beetroot is due to a similar substance. The brown pigment of the mushroom is an isomeride of chlorophyll; the yellow pigment of the mushroom is shown to be the same as that of the onion. The brown pigment of certain fungi is essentially the same as that of the mushroom; its chief difference is the strongly orange-red type of pigments in plants of different species than in leaves of any one plant of different age or subject to different conditions of exposure. The amount varies from 0.6% to 1.2% of the dry weight and is usually about 0.5%, 0.6% being the a and 0.2% the b component. There is no noticeable variation during the day. The yellow pigment varies in amount between 0.1 and 0.2%, 0.07 to 0.12 being xanthophyll and 0.03 to 0.05 carotene. Expressed in molecular proportions, the a component is present in the ratio of 3 to that of the b variety; the yellow pigments are present in the reversed ratio of 1 to 5-2 of the corresponding compound of chlorophyll but the variation being greater between exposed and shaded leaves than in the chlorophylls. The ratio (a+b) of the chlorophylls to the yellow pigments (d-x) as a mean of all the determinations made is 3:56, the value for exposed leaves being 3:07 and for shaded 4:68. Only further inquiry can show whether the coloured components of the chloroplasts are all genetically connected and which have functional significance.

It is a striking fact that chlorophyll has the closest affinity with haemoglobin, the red colouring matter of blood, the central system of each being apparently a complex of four substituted pyrrole rings; the two compounds are so closely related, in fact, that they may be reduced to the same compound, atiophor-
phein in $C_2H_3N$, when decarboxylated; in the one, an atom of the metal iron is included, in the other an atom of the metal magnesium; these metals, however, are not in the state in which they occur in their ordinary salts. When completely degraded, both compounds give rise to a mixture of the three simple pyroles:

- $CH_3-C-C_2H_4$
- $CH_3-C-C_2H_4$
- $CH_3-C-C_2H_4$
- $CH_2-C-C_2H_4$
- $CH_2-C-C_2H_4$
- $CH_3-C-C_2H_4$
- $NH$
- $NH$
- $NH$

The character and complexity of their structure will be apparent on consideration of the following formula assigned provisionally by Willstätter to aithiophorin, the derivative common to both compounds:

$$CH=CH \quad C-C \quad C-C$$

Aithiophorin is convertible into a magnesium derivative, aethiophyllin, $C_5H_3N.Mg$, which is probably formed from it by the displacement of the two atoms of hydrogen in the two NH groups shown in the above formula. Perhaps the iron occupies a like position in haemoglobin.

In haemoglobin, the coloured system is loosely coupled with a peculiar protein, globin, present to the extent of 94% in the complex molecule; in the less weighty molecule of chlorophyll, the coloured system is coupled with the wax alcohol, phytol, $C_{25}H_{56}$. Both appear to be derivatives of dicarboxylic acids; the disposition of the COOH groups in haemoglobin is not clear but probably they are in connexion with the globin; in chlorophyll, one is neutralized by methyl, the other by the phytol radicle. Chlorophyll, unlike haemoglobin, is associated, in most plants, with an enzyme, by which it is hydrolyzed into phytol and the carboxylic acid, chlorophyllid; not only may the action be reversed (to the extent of 65%) but if hydrolysis is not affected, in presence of either methyl or ethyl alcohol, methyl or ethyl takes the place of the phytol radicle. The behaviour of the enzyme is precisely that of the enzyme lipase towards fats and towards mixtures of fatty acids and alcohols.

Alkalies convert chlorophyll into the corresponding dicarboxylic acid, from which the magnesium is easily displaced by hydrogen by means of acid:

$$[MgNC_6H_4OH(CO_2H)] + 2OH^- = [MgNC_6H_4OH][CO_2H_2] + CH_3OH$$

The special activities of haemoglobin and chlorophyll are in no way accounted for, at present, by what is known of their structure; colour apparently is of no consequence in the former but it is held to be the prime factor in the functional activity of the latter. Presumably both act as particulate agents, in virtue of their high molecular weights, not in solution. The oxygen-holding power of haemoglobin is commonly ascribed to the iron and it is supposed that the gas enters actually into combination with the molecule; whilst the former is mere matter of opinion, the latter view is supported by evidence, i.e. by the fact that the formation of oxyhaemoglobin involves the addition of a definite proportion of oxygen. Chlorophyll is not known to behave in a similar way towards carbon dioxide. Willstätter has shown, however, that when the gas is passed into water in which chlorophyll is suspended, this is converted into phaeophylin, the magnesium being wholly displaced, as indicated by the equation:

$$C_6H_5O_2N.Mg + 2HCO_3^- = C_6H_5O_2N + Mg(CO_3H)$$

The action may be stopped halfway, when apparently the magnesium is only half dissected out of the molecule and is retained, perhaps, together with an added molecule of carbon dioxide, thus:

$$\begin{array}{c}
\text{C}_3\text{C}_3\text{C}_3\text{N.C.} \\
\text{Mg} + \text{H}_2\text{CO}_3 \rightarrow \\
\text{MgO.C.O.OH} \\
\end{array}$$

On the assumption that such a mechanism is operative, it is possible to understand how the carbonic acid is brought into the circuit of change and under the direct influence of the pigment. The acid would be at a maximum concentration at the surface of the particles. The acid radicle MgO.CO.OH would necessarily be a terminal point from which electrolysis could proceed; so that if, on exposure to light, a photoelectric wave were propagated from this point, throughout a circuit in which acid-water was included, the water would be electrolysed and the carbonic radicle might well be subjected to the attack of hydrogen ions and reduced, ultimately to formaldehyde, chloroplyl being regenerated in the process. The correlative product of electrolysis would be hydrogen peroxide ($2H_2O_2 \rightarrow 2H_2O$).

The evolution of oxygen from the plant in such case would be the consequence of the decomposition of hydrogen peroxide, perhaps by "catalase." That evolution of oxygen and reduction of carbonic acid are coincident phenomena can scarcely be doubted, as the gas is only produced in presence of the acid and the volume liberated is proportional to that of the carbon dioxide absorbed. It is conceivable that one of the chlorophyll components may play the part of a catalyst, even that the more oxidised may act as platinum black, in the manner Willstätter has suggested: but these are all matters of mere surmise at present. Maybe a more complex circuit is formed than that postulated, one in which perhaps a depolarizer is included; these are all points, however, which must be left for further inquiry.

It is conceivable that the function of iron in haemoglobin is similar to that pictured of magnesium in chlorophyll: that the iron atom becomes partially separated from the molecule, owing to the formation of a perhydrox radical, similar to that postulated by Willstätter as the active agent in platinum black and as operative in ferrous sulphate perhydrox.

Whatever the process it is to be supposed that formaldehyde ($CH_2(OH)_2$) is the initial product of the assimilation of atmospheric carbon dioxide by the plant; no other explanation that will meet the facts has been advanced. No laboratory proof that carbonic acid can be reduced and carbon produced in minute amount, however, is of the least value in enabling us to understand the origin of life. We have to account not for the formation of sugar but of one of the several not to say many possible isomeric forms as a fundamental structural unit: to explain why of the two glories of like structure but enantiomorph—i.e. related to one another as an object is to its image or one hand to the other—both of which are produced simultaneously in equal amounts when the synthesis is effected under artificial conditions, only the one is formed within the plant. What act or accident determined such selection, it is impossible to say; whatever happened, the future course of natural action was limited thereby to one type of symmetric material—to the one-handled forms, in genetic relationship with that first selected. Innate peculiarities, only dimly perceptible at present, are also operative in restricting the number of the primary constructive units. It is a remarkable fact that formaldehyde gives rise to a hexose almost directly, yet it is to be supposed that condensation takes place gradually. In presence of weak alkali it rapidly gives rise to both fructose and sorbose; other products are formed which have not yet been identified; no intermediate products have been reported, such as are formed fortuitously undergo further change. The product of the interaction of two molecules would be glycolic aldehyd—

$$C_2H_4(OH) + C_2H_4(OH) \rightarrow C_2H_6(OH).C_2H(OH) + O_2$$

This is a known substance; it has been shown to give rise to the same hexose as formaldehyde under the influence of alkali. If three molecules of formaldehyde were to interact directly or glycolic aldehyd were to be attacked by formaldehyde, two
trioses might be formed, glyceraldehyde and glycerol; ketose; thus
\[ \text{CH}_2(\text{OH}) + \text{CH}_2(\text{OH}) \rightarrow \text{CH}_2(\text{OH}) + \text{CH}_2(\text{OH}) + \text{OH}_2 \]
and other isomers. Both compounds are known: they are easily obtained by oxidising glycerol, \( \text{CH}_2(\text{OH}) - \text{CH}_2(\text{OH}) - \text{CH}_2(\text{OH}) \). In solution, in the presence of a trace of alkali, the one is rapidly converted into the other; consequently a solution made from either is a mixture of the two in equilibrium; but as the molecule of glyceraldehyde is asymmetric, this compound is present in two forms of opposite optical activity:

\[ \begin{align*}
\text{CH}_2(\text{OH}) & \quad \text{CH}_2(\text{OH}) \\
\text{HC.OH} & \quad \text{HO.CH} \\
\text{CH.(OH)} & \quad \text{CH.(OH)} \\
\text{CH(OH)} & \quad \text{CH(OH)} \\
\text{H.CO.OH} & \quad \text{H.CO.OH}
\end{align*} \]

Fructose and sorbose, the two ketohexoses obtained in laboratory operations, in the manner described, whether from formaldehyde, glycollic aldehyde or the complex triose mixture referred to, are constituted as represented by the formulae

\[ \begin{align*}
\text{H.OH.OH} & \quad \text{H.OH.OH} \\
\text{CH}_2(\text{OH}).\text{C.O.H} & \quad \text{C. C. C. CH}_2(\text{OH}) \\
\text{CH.(OH).H} & \quad \text{CH.(OH).H} \\
\text{Fructose} & \quad \text{Sorbose}
\end{align*} \]

The formation of the two isomerides is accounted for, and is indeed to be expected, on the assumption that the condensation is effected equally between glycerol and each of the two oppositely active forms of glyceraldehyde, which would necessarily be present in equal proportions: for the same reason each isomer would be produced in its two forms of opposite optical activity. It is a remarkable fact, therefore, that whereas fructose is of universal occurrence in plants, sorbose is very rarely met with; this is one of the many indications that in plants the course of synthesis is narrowly directed.

It is conceivable that if six molecules of formaldehyde were brought into position side by side and condensation took place throughout the series, all the possible hexoses might be formed: there is the fortunate arrangement of the molecules in the many possible arrangements. The force of the argument is lessened by the probability that affinities would come into play which would determine arrangements in particular ways: probably the number would be less than is conceivable but yet greater than it actually happens to be. This conclusion, however, but serves to confirm the argument used above as to the actual course of the process: that it is essentially a stage process. Perhaps in nature, at least, pentoses may be formed directly, but to judge from laboratory experience it is equally if not more probable that the hexoses are the only primary products and that other simple carbohydrates are derived from them: in other words that the hexoses are the primary products and reserve materials.

The preferential formation and the superior stability of the hexose system is to be referred to certain peculiarities of structure which are probably innate in the component elements. It has long been held that the aldehydeic sugars are not true aldehydes and the ketonic not true ketones; they are too inert in behaviour to pass as such. The true aldehydes and ketohydroxy compounds are present, in the form of acetal reaction products, which are present in the form of the two isomerides which will arise in this way. As a matter of fact "glucose" is known to be an equilibrated mixture of an \( \alpha \) and \( \beta \) form, differing in optical activity and other ways, which can be separated. If either be redissolved in ordinary water it soon passes over into the other until equilibrium is again reached. If hydrogen chloride be added to a solution of glucose in methyl alcohol, after a time two methyl-glucosides can be separated, an \( \alpha \) and a \( \beta \) form:

\[ \begin{align*}
\text{HO.H}_2 & \quad \text{CH.OH} \\
\text{HO.C} & \quad \text{CH.(OH)} \\
\text{H} & \quad \text{CH.(OH).CH(OH).CH(OH)}
\end{align*} \]

These are neutral, very stable compounds as compared with the parent sugars. They are the prototypes of a large class of glucosides met with in plants and may be hydrolysed by enzymes which attack these latter. Hence it is possible to classify glucosides generally, in so far as they can be hydrolysed by enzymes which hydrolyse either a \( \alpha \) or a \( \beta \) methylglucoside and can thus be correlated with either the \( \alpha \) or the \( \beta \) form of glucose. The enzyme maltase or a-glucase, present in yeasts, is used in characterising a-glucosides, the \( \beta \)-glucase in almond emulsion in characterising \( \beta \)-glucosides.

All sugars of the allose and ketose types behave as described. The fructose sugars exist as condensed stable systems similar to that of glucose and, therefore, should persist, if formed when formaldehyde undergoes change and is converted ultimately into hexose sugars. Their non-production gives further weight to the argument that these latter are formed from the trioses.

Recently a third or \( \gamma \) form of methylglucoside has been found in the mixture obtained by the interaction of glucose and methylalcohol. This new glucoside is very different from the \( \alpha \) and \( \beta \) forms; it is easily hydrolysed and easily oxidized by permanganate and very active in other ways. Probably it is a condensed system of the ethylenic oxide type:

\[ \begin{align*}
\text{CH}_2 & \quad \text{O} \\
\text{CH.OCH}_2 & \quad \text{CH.OCH}_2 \\
\text{CH}_2 & \quad \text{O}
\end{align*} \]

Ethylene oxide and glucoside

The discovery is of primary importance, as it has led to the discovery of a similar form of fructose and has given the clue to the nature of cane sugar, long remarkable on account of the extreme ease with which, in comparison with other sugars, it is hydrolysed by acids and by the special enzyme invertase. The formula suggested for cane sugar is:

\[ \begin{align*}
\text{Glucose} & \quad \text{CH}_2(\text{OH}) \cdot \text{CH}(\text{OH}) \cdot \text{CH}(\text{OH}) \cdot \text{CH}(\text{OH}) \\
\text{Fructose} & \quad \text{CH}_2(\text{OH}) \cdot \text{CH}(\text{OH}) \cdot \text{CH}(\text{OH}) \cdot \text{CH}(\text{OH})
\end{align*} \]

The difficulty in accepting this interpretation is that sugar is shown as either an \( \alpha \) or a \( \beta \)-glucose and that it is hydrolysed only by a specific enzyme, not by either \( \alpha \) or \( \beta \)-glucose. There can be little doubt that the fructose element is present in the \( \gamma \) form; if the glucose were also in the \( \gamma \) form the peculiar behaviour of cane sugar towards acids would be even better explained.

Although, in the laboratory, the sugars obtained from formaldehyde are the two ketoses, fructose and sorbose, in the plant glucose plays the preponderating part to a remarkable extent. Only three of the sixteen possible hexaldoses and two ketoses, glucose, mannose, galactose, fructose and sorbose, are met with as such or in combination in plants. Three of these are reversibly interrelated—glucose, mannos and fructose. If a solution of any one of the three be made alkaline and kept, gradually the other two make their appearance. A natural process is at work which seems to assure even the rapid passage of any one of the three into the others. It has been shown that, during fermentation with the aid of the juice expressed from yeast, an enzyme—phosphatase—is active, which, in presence of phosphate gives rise to a diphosphoric glucoside, \( \text{CH}_2\text{O}_4(\text{PO}_4\text{P}_2) \), the result is the same whether mannose, glucose or fructose be taken, but when
this glucophosphate is hydrolysed only fructose is recovered. It is noteworthy that phosphoric acid has a determining influence on the plant, especially during the ripening period: it may well be one of its functions to promote the interconversion of carbohydrates in the manner indicated; if it can convert glucose into fructose it should be able to produce the contrary change, and so supply the material for producing either starch or cellulose or both.

The actual change in an alkaline solution is pictured as involving the production, by dehydrogenation of an unsaturated "enolic" compound common to the three hexoses and the conversion of this by dehydration, only in part into the original form and in part into the other two. The process is one apparently which plays a prepondering part in the course of vital changes. The alteration is only in the first and second carbon systems of the sugar; the manner in which it takes place is simple, thus:

\[
\begin{align*}
\text{CH(OH)₂} & \quad \text{Glucose} \\
\text{HC.OH} & \\
\downarrow & \\
\text{Mannose} & \quad \text{CH(OH)₂} \\
\text{CH(OH)₂-OH=} & \quad \text{COH} + \text{OH} \rightarrow \text{HO.COH} \\
\text{CH(OH)₂} & \quad \text{Fructose}
\end{align*}
\]

It has been pointed out that, in the laboratory, sorbose is formed together with fructose, when formaldehyde is condensed, and that it is of rare occurrence in nature; if changed in solution as fructose is changed it would be converted into the sugars idose and gulose, but neither of these is met with. This fact and the rarity of sorbose is further proof that the vital synthetic process is narrowly controlled.

It remains to account for the production of galactose, which is very widely distributed and probably always present in plants, in small amount (as raffinose); this hexose is characteristic of mammalian milk, being coupled with glucose in milk sugar. Galactose is closely related to glucose: to account for the conversion of one into the other, it is necessary merely to assume that the glucose is resolved, by hydrolysis, into two molecules of glycerol, one of which is then changed in the gummy of fructose, the other, by the reversal of the position of the median OH group—a change known to occur in solution; if the two molecules of opposite activity were then associated through the agency of a directing mechanism the change might well be complete.

Two pentoses are commonly met with in plants but only in combination, the one d-xylrose, corresponding to glucose, the other, L-arabinose, to galactose; a third, d-ribose, is also found, which is the only pentose normally present in animal tissues, in both cases as a characteristic constituent of the nucleic acids. Arabinose and xylolose are important components respectively of the gums and of straw and wood; at present, there is no clue to the manner in which they are formed from hexoses in the plant, if indeed they are so formed: it is not improbable that an oxidation process may be at work, by which the CH₂OH group is removed from the hexose molecule whilst it is held in combination at the aldehyde end.

The higher carbohydrates are made up of hexose and fructose units in ways in which we are only beginning to know: in fact, starch, cellulose and inulin are the only three of whose complete anatomy we have learnt anything, and the information does not carry us far. The labour involved in similar work is immense, and methods of dissection are few. The most informative is that introduced by Purdie and developed by Irvine and his school, involving the methylation of the carbohydrate, the resolution of the complex into the constituent hexose fragments and the determination of the position taken up by methyl radicals in these: whence it is possible to infer, with more or less certainty, the manner in which the fragments were linked.

Whilst the primary unit of starch is glucose, into which it is resolved when completely hydrolysed, the chief secondary unit is the dihexose maltose, which is obtained as main product when starch is hydrolysed by the enzyme diastase; whether the sub-

sidary more complex product, dextrin, is also composed of maltose units is uncertain. Maltose is formed by linking two molecules of glucose in direct apposition. The primary unit of cellulose is also glucose; the secondary unit, however, is a dihexose isomeric with maltose, cellose, differing from the former in that the two glucose bricks are laid, as it were, the one advanced a sixth of its length beyond the other. Moreover, the one is an a-glucoside hydrolysed by maltose; the other apparently is a β-glucoside, as it is hydrolysed by emulsin. A third diglucose is known in gentiobiose, which is obtained, together with cane sugar, when the trihexose gentiobiose from gentian root is hydrolysed by invertase; it is not only hydrolysed by emulsin but has been reproduced from glucose by the action of this enzyme; it is therefore undoubtedly a β-glucoside, and probably the β-glucoside alternative to the α-glucoside, maltose.

The formula of the three sugars may be written as follows:

\[
\begin{align*}
\text{CH₆(OH)₃.CH(OH)₂.CH.CH₂(OH)₂.CH₂} & \\
\text{CH(OH)₄.CH(OH)₂.CH.CH₂(OH)₂.CH₂} & \\
\text{CH₆(OH)₃.CH(OH)₂.CH.CH₂(OH)₂.CH₂}
\end{align*}
\]

Trehalose, a glucol-dihexoside widely distributed in fungi, appears to be the representative of the third type, but its structure is not yet ascertained. As it has no "aldheydic" properties, such as are shown by the three sugars previously considered. It is supposed that the two glucose components may be joined as shown by the formula:

\[
\begin{align*}
\text{CH₆(OH)₃.CH(OH)₂.CH.CH₂(OH)₂.CH₂} & \\
\text{CH₆(OH)₃.CH(OH)₂.CH.CH₂(OH)₂.CH₂} & \\
\text{CH₆(OH)₃.CH(OH)₂.CH.CH₂(OH)₂.CH₂}
\end{align*}
\]

It is to be expected that such a compound would be hydrolysed either by maltase or by emulsin; such is not the case but it is resolved by a special enzyme present in fungi which appears to be peculiar to the sugar. The examples given may suffice to illustrate the manner in which hexose units may be linked together.

Inulin, the reserve material of the artichoke and dahila tuber, is entirely composed, apparently, of fructose units in the γ-form. When acetylated it gives rise to a well-defined crystalline triacetate, which is clearly a simple derivative of the parent substance as inulin may be reproduced from it by careful hydrolysis. The determination of the molecular weight of this compound shows that it contains nine fructose units—a peculiar number. In some plants, the monocotyledons especially, the place of starch is taken by cane sugar, little if any starch being formed; even in those in which starch is produced in considerable amount cane sugar is always present in the leaves, and it has been argued that cane sugar rather than starch may well be the primary product of assimilation. It is difficult at present to offer any rational explanation of the formation of cane sugar; the wish would be to regard it as traceable to enzyme activity.

All attempts hitherto made to synthesise cane sugar have failed: it is completely hydrolysed by invertase. Either the point of equilibrium is so near to that of complete hydrolysis that it escapes detection, or the intermediate products at once undergo change in solution and cease to be susceptible to the revertive influence of the enzyme: the fact that fructose is present in the γ-form in cane sugar and that this form does not persist in solution, either in fructose or dextrose, may not be without bearing on the problem. It is a matter of interest that cane sugar is usually present in leaves in considerable amount in the cellulose and together with invertase, but in some way separated from it:
CHEMISTRY

The most interesting member of the class perhaps is that first studied, amygdalin, present in considerable quantity in the fruit of the bitter almond and also in the fruit of most of the Rosaceae. It is resolved by emulsin—which is equally well obtained either from the sweet or the bitter almond—into two molecules of glucose, one of benzoic aldehyde and one of hydrogen cyanide:

\[ \text{C}_6\text{H}_5\text{O}_2\text{N} + 2\text{H} + 2\text{C}_2\text{H}_5\text{OH} + \text{C}_2\text{H}_4\text{O}_2 + \text{HCN}. \]

The two latter are present in direct association, as in the cyanhydril, \( \text{C}_4\text{H}_8\text{CH(OH)}\text{CN} \) in its dextro-rotatory form, the isomeric laboratory form being present in sambunigrin, from which it differs—which, however, contains only one glucose residue. By the action of one of the enzymes in emulsin, amygdalin, amygdalin is resolved into glucose and prunasin, the isomeric of sambunigrin; this heteroglucoside occurs naturally in the leaf of the almond and of the common cherry laurel—in fact, in the leaves of all Rosaceae whose fruits contain amygdalin. Laurel leaves particularly are rich in an enzyme, prunase, which hydrolyses prunasin; this is present together with amygdalase in all fruits containing amygdalin. The resolution of amygdalin therefore, involves, it will be seen, the action of two enzymes in succession. What appears to be amygdalase is present in some one, together with maltase. The advantage to the plant is that the leaf contains the more soluble glucoside, that in the fruit being but slightly soluble; the presence of glucose and fructose in the leaf and stem but of starch in the tuber of the potato is a parallel case. How the two glucose residues are united is not determined: the probability is that amygdalin is derived from gentiobiose. Prunase apparently is the \( \beta \)-glucase in emulsin which acts on the \( \beta \)-methyglucoside and the \( \beta \)-heteroglucosides generally: to explain its indifference towards amygdalin and the varying degree of activity which it displays towards different \( \beta \)-glucoses, it is necessary to assume that the group associated with glucose influences the fit of the enzyme. If the enzymes be, as suggested, but replicas, in part, of the hydrolyses they effect, in each particular class, the glucoside characteristic of the class may well be contained in the enzyme: thus prunase from the Rosaceae is conceivably a prunasin derivative, whilst the linase of the Linaceae may be a derivative of the cyanhydril of acetone, \( \text{C}(\text{CH}_3)_3\text{O} \) \text{CN}; consequently although both enzymes affect prunase they do not act with equal readiness; the addition of a second molecule of glucose to prunase, although it happens in the \( \beta \)-position, may spoil the fit of prunase, entirely. The problem is one of extraordinary interest and importance.

Glucose and its congeners are of special value in the plant, as constructive materials, on account of their peculiar plasticity under the numerous enzymic and other influences simultaneously brought into action in nature. These are specially manifest in the phenomena of fermentation. In recent years the controversy which has long been waged over the fermentation process, as effected by yeast and other organisms, has been settled against the vitalists, as it is proved that it can be carried out apart from the living cell, in its entirety, by means of the juice expressed from yeast, and even in the presence of substances, as acetone and toluene, fatal to the life of the cell. The course of change is by no means ascertained: as yet only the main outlines are marked out, but these are of such significance that it is clear that a most delicate balance of forces comes into play.

When the formulas are contrasted it is obvious that the ultimate conversion of glucose into carbon dioxide and alcohol must involve much rearrangement within the molecule. Oxygen must be removed from some of the carbon atoms and its place taken by hydrogen; the reverse operation has to be effected at others. That such changes can be induced by mere contact with acids or alkalies is well known: thus lactic acid, \( \text{CH}_3\text{CH(OH)}\text{CO}_2\text{H} \), is easily formed by digesting glucose with alkali; reduction is carried still further in the production of lactic acid, \( \text{CH}_3\text{CO}_2\text{H} \) by boiling either fructose or glucose with an acid, fructose being the far more easily attacked. This latter fact is perhaps not without significance.

A variety of factors come into play when fermentation is induced by yeast juice. Phosphate plays a part of fundamental
CHEMISTRY

importance. When a suitable quantity of a soluble phosphate—
best in the form of a solution of disodium phosphate saturated
with carbon dioxide—is added to a slowly fermenting mixture of
the juice with glucose, a rapid rise is observed in the rate of fer-
mentation, as measured by the amount of carbon dioxide evolved.
As change proceeds, the amount of free phosphate in solution
diminishes up to the point at which the rate of change begins to
diminish; the diminution has been traced to the formation of a
phosphoric ester of glucose. Apparently, action takes place as ex-
pressed in the equation:

\[ 2\text{CH}_3\text{H}_2\text{O}_4 + 2\text{PO}_4\text{H}_2 = 2\text{CH}_3\text{OH} + 2\text{H}_2\text{O} + \text{CH}_3\text{H}_2\text{O}_4(\text{PO}_4\text{R}_2) \]

that is to say, while one molecule of sugar is fermented a second is
fixed as phosphate. Apparently, however, all the sugar passes
through the phosphate stage in its way to fermentation; as this
slackens and finally ceases the amount of free phosphate in solu-
tion steadily rises, the action being reversed the while:

\[ \text{CH}_3\text{H}_2\text{O}_4(\text{PO}_4\text{R}_2) + 2\text{H}_2\text{O} = \text{CH}_3\text{H}_2\text{O}_4 + 2\text{PO}_4\text{H}_2 \]

The formation and destruction of the phosphate are changes due
to the action of an enzyme, hexosephosphatase.

The point of importance to be noted is that, whatever sugar be
fermented—glucose, mannos or fructose—the hydrolytic product
is fructose: one function, at least, of the hexosephospha-
tase would seem to be the presentation of the sugar to the resolv-
ing mechanism in the form most sensitive to rearrangement.

The resolving mechanism has several components. It contains
one or more enzymes easily destroyed by heat, together with a
so-called co-enzyme which survives when the liquid is boiled.
These may be separated by mere filtration, under pressure,
through a film of gelatin supported in a Chamberland fil-
candle; neither residue nor filtrate alone will condition fermenta-
tion, but when they are reunited a mixture is obtained which is
almost as active as the original fluid. Little, if any, light has been
thrown on the nature of the resistant constituent: the most sug-
gestive observation made is that it disappears from boiled yeast
juice when this is digested with castor-oil lipase, an enzyme which
hydrolyses fats and similar substances.

As to the course of change at some stage apparently the hexose
molecule is resolved into two "halves," but whether before or
after rearrangement is uncertain. There is, however, reason to
suppose that the production of alcohol involves the prior pro-
duction of aldehyde and the ultimate reduction of this latter.
The formation of aldehyde is attributed to that of pyruvic acid,
\( \text{CH}_3\text{CO.CO}_2\text{H} \), which is resolved into carboxylic acid and alde-
hyde by the action of \text{carboxylase}, an enzyme normally present in
yeast:

\[ \text{CH}_3\text{CO.CO}_2\text{H} + \text{OH}^- = \text{CH}_3\text{COH} + \text{CO}_2\text{H} \]

Not only has this acid been obtained as a product of fermentation,
but when fermentation is effected in presence of an excess of
alkaline sulphite an amount of aldehyde is produced approaching
that to be expected on these assumptions, if one half the mole-
cules were so affected; at the same time, glycerol is produced in
almost corresponding amount.

It seems probable, therefore, that in the ordinary fermentation
process the hexose is normally resolved into a mixture of glycerol-
dose and glycero ketose, which became rearranged into pyruvic
aldehyde, by enolisation and rehydration. The oxidation of these
two molecules of aldehyde to pyruvic acid might then conceiv-
bly be the consequence of the reduction of two molecules of
ordinary aldehyde to alcohol—the reduction of these must in
some way be accounted for. If acetaldheybe an intermediate
product of fermentation. As a matter of fact, the function of an
ordinary hydrolytic enzyme is nearly of this order, involving as
it does either the separate presentation of the H and OH of water
at two contiguous regions in a molecule or their withdrawal from
two contiguous molecules, according as its action is either hydro-
lytic or synthetic. A directed interaction of the character con-
templated is therefore not improbable. Not only is yeast known
to contain the enzyme carboxylase which fits pyruvic acid, but
also another enzyme, \text{glyoxalase}, by which pyruvic aldehyde is
converted into lactic acid, an operation involving (1) hydration,
(2) enolisation, (3) reversed hydration, starting from the

aldehyde \( \text{CH}_3\text{CO.CH(OH)} \): \( \text{CH}_3\text{C(OH)}_2\text{CH(OH)}_2 \)

\[ \text{CH}_3\text{C(OH)}_2\text{CH(OH)}_2 = \text{CH}_3\text{CO}\text{H} + \text{CH}_3\text{OH} \]

That the yeast complex may do all the things suggested is,
therefore, by no means improbable. Glyoxalase, it may be added,
occurs in various animal tissues, and the lactic acid formed as the
result of muscular action may well be produced under its di-
rective action. A striking observation made with yeast juice
is that the action stops on adding hydrogen cyanide but re-
commences when this is removed. Yeast ceases to decompose hy-
drogen peroxide when the cyanide is added. Maybe, in both
cases either an oxidase or a peroxidase is held in check which is
effective in the pyruvic change.

A discovery of great significance, as throwing light on the re-
ductive stage, is that recently made by Gowland Hopkins, of a
minute constituent of yeast juice, liver substance and muscular
tissue, glutathione, a neutral derivative (dipeptide) formed by
the condensation of the two amino-acids, cysteine and glutaminic
acid. It is a powerful reducing agent and acts as a carrier of
hydrogen; cysteine is a sulphur derivative of alanine and is
readily converted into cystin, by oxidizing agents; moreover, the
change is reversible.

\[ \begin{align*}
\text{CYS} = \text{CYS} & \text{C} \text{NH}_2 \\
\text{CYS} = \text{CYS} & \text{C} \text{SH} \\
\end{align*} \]

Glutathione apparently is but cysteine weighted by glutaminic
acid, and its activity is doubtless the consequence of a similar
change. Possibly the hitherto unidentified co-enzyme of yeast
juice may prove to be this substance.

General Synthetic Activity.—That the plant exercises its syn-
thetic activity with the aid merely of the simple cleavage prod-
ucts derived from carbohydrate material, by processes similar to
those involved in alcoholic fermentation, is clear. The adj-
uncts are merely atmospheric oxygen and various materials ob-
tained from the soil—especially ammonia phosphoric acid, mag-
nesium and silicon; these are all of structural significance; in ad-
dition, iron and manganese, calcium and potassium, appear also to
be indispensable, but are mainly, if not entirely, of value as
functional agents. Although it is established that potassium is
essential to the formation of starch, if not of other carbohydrates,
no clue has yet been found to the office it exercises. Sodium, be-
ing there, is taken into the plant; whether it be in any way neces-
sary, as it is to the animal, we do not know.

Whilst many compounds are undoubtedly formed under en-
zymic influences, others are products of the direct spontaneous
interaction of materials which happen to meet. The precise
manner in which even the simple benzene derivatives met with
in plants are formed is not yet clear. That even substances so
complex as the opium and other alkaloids may be formed,
without difficulty, is shown by R. Robinson's remarkable ob-
servation that troipnone, a compound closely related to one group
of these alkaloids, is produced when the aldehyde of succinic acid,
methyamine and acetone, or still better its dicarboxylic acid, are
merely brought together, in aqueous solution, at the ordinary
temperature:

\[ \begin{align*}
\text{CH}_3\text{CO} & \text{H} \\
\text{CO} & \text{CH}_3\text{NH}_2 \\
\text{N.CH} & \text{CO} \\
\text{CH}_3 & \text{CH}_2 \\
\end{align*} \]

Succinic aldehyde

Acetone Methyl amine Troipnone

Plant Colours.—Considerable diversity in character may be
the outcome of small differences in chemical structure: this is well
illustrated in the colouring matters of flowers which, it is well
known, vary over a considerable range. The yellows, however,
appear all to be derivatives of a simple compound, not itself
coloured, flavone, which occurs as a mealy deposit on the leaves
and flower stalks of a large number of Primulaceae. It is resolved,
by hydrolysis, into the two simple compounds, salicylic acid and acetophenone, from which it may well be formed in the plant:

\[
\text{Flavone} \quad + \quad 2\text{H}_2\text{O} \quad \rightarrow \quad \text{C}_{6}\text{H}_{4}\text{O}_2 \quad \text{OH} \quad \text{CO}_2\text{H} \quad + \quad 2\text{CH}_3
\]

The plant yellows are hydroxy-derivatives of flavone, varying in the manner and position of the hydroxyl groups; but whilst some are flavones in which these groups are contained only in the benzene sections of the molecule, others are flavanols, i.e. derivatives of the simple hydroxy-compound

\[
\text{C}_{6}\text{H}_{12}\text{O}_7\text{N}_3\text{C}_6
\]

The plant colouring matters other than the yellows which are now generally grouped as anthocyanin colours, are derived from the yellows by a very simple process—merely by reduction, a process, however, which involves their conversion into derivatives of ortho-quinone, as shown by the following equation representing the change of the flavonol quartin into cyanin chloride:

\[
\text{C}_{6}\text{H}_{12}\text{O}_7\text{N}_3\text{C}_6 \quad + \quad 2\text{H}_2\text{O} \quad \rightarrow \quad \text{C}_{6}\text{H}_{12}\text{O}_7\text{N}_3\text{C}_6 \quad \text{Cl} \quad \text{OH} \quad \text{CO}_2\text{H}
\]

The colour produced by an anthocyanin depends not only on the number and position of the hydroxyl groups but also on its condition, in the plant cell—whether it be present in combination with acid or as a salt.

Nuclear Materials.—Substances which play a determining part as structural elements, if not as functional agents, are far more complex. The nucleic acids are the chief. Nucleic acid, from yeast or the wheat embryo, for example, which has the formula \(\text{C}_{6}\text{H}_{12}\text{O}_7\text{N}_3\text{C}_6\), may be resolved into four sections known as nucleotides, all of which have been isolated and studied of late years, particularly by the American chemists, Levene and others. Each of these nucleotides consists of the peculiar pentose, ribose, associated, on the one hand, with phosphoric acid, on the other, with a purine base (a compound of the uric acid series), the two former being common to all four sections but each having its special basic constituent, namely, one of the following:

\[
\begin{align*}
\text{N} & = \text{C}.\text{NH}_2 \\
\text{C} & = \text{NH} \\
\text{C} & = \text{NH} \\
\text{C} & = \text{NH}
\end{align*}
\]

Nucleic acid of animal origin contains a hexose in place of the pentose, ribose; moreover, the basic elements are not all the same, methylnoracil (thymine) taking the place of uracil.

The formula assigned to plant nucleic acid is:

\[
\begin{align*}
\text{HO} & \quad \text{OP.O.C}_2\text{H}_4\text{O}_2 \quad \text{C}_2\text{H}_4\text{O}_3 \\
\text{HO} & \quad \text{OP.O.C}_2\text{H}_4\text{O}_2 \quad \text{C}_2\text{H}_4\text{O}_3 \\
\text{HO} & \quad \text{OP.O.C}_2\text{H}_4\text{O}_2 \quad \text{C}_2\text{H}_4\text{O}_3 \\

\end{align*}
\]

Complex materials thus constituted, comprising acid, neutral and basic sections, this last of varying structure, obviously must offer numerous attractions such as befit a nuclear substance; probably, however, the phosphoric units are the main functional elements, and it is in these compounds particularly that the special value of phosphoric acid to the living organism is apparent. The nucleins are accompanied by a number of enzymes which, doubtless, are concerned in their formation; these suffice not only to resolve them, when necessary, into their proximate components but also to convert the basic units into uric acid.

The Proteins.—The fundamental phenomena of vital activity are best studied, at present, with the aid of carbohydrate material, because of its greater simplicity; there is, however, every reason to suppose that, in the main, the same considerations apply to the problems offered by nitrogenous materials. The possibilities are more numerous but the lines of action and reaction are of the same order. The contexture and configuration of carbohydrate material cannot be greatly varied; although, as shown in artificial silk, cellulose has strength and a world might be built of carbohydrate material, it would undoubtedly display great poverty of pattern and less colour. The introduction of nitrogen has added enormously to structural variety and strength. Elsewhere the complex carbohydrates have been compared with pavements of simple mosaic; the proteins, which play so large a part, especially in animal life, are more like a jigsaw puzzle.

The proteins are the formative materials of animal structures. They are commonly known in such materials as wheat gluten—easily separated from the accompanying starch by kneading flour in a gently-running stream of water; egg white; milk casein; glue or gelatin; and as the chief constituent of meats. A number of proteins have been obtained in crystalline form, but they are undoubtedly all substances of high molecular weight. Like the higher carbohydrates they can be resolved into simple units by hydrolysis either by acids or by enzymes. They yield a numerous and varied series of fragments; the following is a list of compounds of the glycine type thus far separated from them:

\[
\begin{align*}
\text{Glycine} & \quad \text{CH}_2(\text{NH}_2)\text{COOH} \\
\text{Alanine} & \quad \text{CH}_2\text{CH}(\text{NH}_3)\text{COOH} \\
\text{Valine} & \quad \text{CH}_2\text{CH}(\text{NH}_2)\text{COOH} \\
\text{Leucine} & \quad \text{CH}_2\text{CH}(\text{NH}_3)\text{COOH} \\
\text{Isoleucine} & \quad \text{CH}_2(\text{CH}_2)\text{CH}(\text{NH}_3)\text{COOH} \\
\text{Serine} & \quad \text{CH}_2\text{OH}(\text{NH}_2)\text{COOH} \\
\text{Lysine} & \quad \text{H}_3\text{N.CH}_2\text{CH}_2\text{CH}(\text{NH}_3)\text{COOH} \\
\text{Arginine} & \quad \text{HN} \\
\text{Phenylalanine} & \quad \text{CH}_3\text{C}_6\text{H}_4\text{CH}(\text{NH}_3)\text{COOH} \\
\text{Tyrosine} & \quad \text{HO.C}_6\text{H}_4\text{CH}(\text{NH}_3)\text{COOH} \\
\text{Aspartic acid} & \quad \text{HOOC.C}_6\text{H}_4\text{CH}(\text{NH}_3)\text{COOH} \\
\text{Glutamic acid} & \quad \text{HOOC.C}_6\text{H}_4\text{CH}(\text{NH}_2)\text{COOH} \\
\text{Hydroxyglutamic acid} & \quad \text{HOOC.C}_6\text{H}_4\text{CHOH.CH}(\text{NH}_2)\text{COOH} \\
\text{Cystine} & \quad \text{HOOC.CH}(\text{NH}_2)\text{CH}_2\text{S.SCH}(\text{NH}_3)\text{COOH} \\
\text{Proline} & \quad \text{CH}_2\text{CH}_2\text{NH} \\
\text{Hydroxyproline} & \quad \text{HO.C}_6\text{H}_4\text{CH} \\
\text{Histidine} & \quad \text{CH}_2\text{NH} \\
\text{Tryptophane} & \quad \text{C}_6\text{H}_4\text{CH}(\text{NH}_2)\text{COOH} \\
\end{align*}
\]
It is not difficult to account for the formation of such compounds from carbohydrate materials and amino acids. Peculiar to all is the group \( \text{CH(NH}_2\text{)}_2\text{CO}_2\text{H} \). The presence of this group is almost certainly a clue to the process by which they are produced, viz., by the action of ammonia on a keto-carboxylic acid. Much has been said above of pyruvic acid: alanine is doubtless formed from this acid by its combination with ammonia and subsequent reduction of the compound-amino acid:

\[
\text{CH}_2\text{CO}_2\text{H} + \text{NH}_2 = \text{CH}_2\text{C(OH)}\text{(NH)}_2\text{CO}_2\text{H}
\]

In the human circulation amino-acids are converted into oxy-acids—which serve as fuels—by the reverse process. As the amino-acids are optically active substances, like the glucosides, the reduction process must be directed in some way: they belong to one series corresponding to that of the natural sugars.

The name amino-acid, usually given to the protein hydrocolists, is not applicable to the compounds as they exist apart, although they function as such. The names in the above list, which are those usually given, indicate that most of the compounds are basic rather than acid. As a matter of fact, owing to internal neutralization,

\[
\text{CH}_2\text{CO}_2\text{H} + \text{NH}_2 = \text{CH}_2\text{C(OH)}\text{NH}_2\text{CO}_2\text{H}
\]

they are all but neutral substances, yet they can act either as acid or base, according to circumstances.

Although obtainable from animal as well as vegetable proteins, all the compounds in the list given, with the exception of the first, are the products of plant activity alone. The office of the animal is to take to pieces the complex structures which are eaten as vegetable food; then, having conveyed them in the blood stream to various parts of the body, to reconstruct them in appropriate special ways. In some cases the units are built up around a phosphoric acid nucleus, particularly in cell nuclei, in brain matter and bone marrow. A number of compounds besides those in the list, even sugars, especially galactose and ribose, are met with proteins.

</table>

The analysis of the proteins is a difficult operation and the results are usually but approximations. In the accompanying table, the results of such an analysis are set out. Those quoted are sufficient to show how complex is their composition and how much variation there is in the proportions of the several components.

Like the higher carbohydrates, the proteins may be broken up into a series of compounds of diminishing complexity by means of several different enzymes acting in succession; these proteolytic enzymes have been relatively little studied and but imperfectly defined. A striking peculiarity of several is that they are active either in strongly acid or strongly alkaline solutions under conditions which render the saccharocharastic enzymes inoperative. This difference is called for probably because of the different way in which the units are linked.

In the carbohydrates the linkage is etheric—two carbon atoms are joined through the agency of an oxygen atom. In the proteins two carbon atoms are linked together through the agency of a nitrogen atom. An additional peculiarity is the presence of a succession of NH.CH.CO groups, each forming as it were a short link in a chain, each link carrying a side-group—which may vary greatly in character and dimensions—attached to the CH member. A large number of "polypeptides" have been built up in the laboratory, from amino-acids, on such a plan as the following:

\[
\text{NH}_2\text{CH}_2\text{CO}_2\text{H} + \text{NH}_2\text{CH}_2\text{CO}_2\text{H} + \text{NH}_2\text{CH}_2\text{CO}_2\text{H} = \text{CYS-CYS-CYS}
\]

Even octadecapeptides have been prepared, indeed there seems to be no theoretical limit to the number of "links" that may be included in the chain. In this field however, as in that of the carbohydrates, there is reason to believe that nature has been sparing in her selection and choice of patterns. At present, not the least clue to the patterns laid down has been obtained: at most the order followed in some of the smaller fragments obtained from proteins by hydrolysis has been ascertained.

The uniformity that exists could not be reached—the possible permutations and combinations are so infinitely numerous—if selective and directive influences were not at work, of the order of those referred to in discussing the carbohydrates. It would be easy to prepare many unit materials similar to those in use in plants and animals, but there can be no doubt they would not be assimilated as foods. If not poisonous they would either be seized on by glucose molecules and quickly emptied into the urine or got rid of as such; or they would be just thrown into the circulation and burnt up in its fires.

The great advance of modern times, since it became possible to analyse the proteins, is the recognition of the prime fact that varied and well proportioned diet is essential, if all the structural elements required in growth are to be at disposal. Latterly the even more important discovery has been made that fresh and uncooked foods contain minute proportions of mysterious materials without which healthy growth is impossible. These indispensable agents or condiments may easily be destroyed in cooking and by preserving foods. Thus infants fed on boiled milk alone rapidly develop symptoms of scurvy, but the addition of a little orange or turnip juice is sufficient to meet the deficiency. To explain such facts and a multitude of similar observations is very difficult, yet the discovery of the explanation is of vital importance, as vast quantities of poor food might have its full value restored, if the deficit in condiment could be made good.

The condiments can scarcely be enzymatic agents, as in most cases they withstand more heating than would an enzyme: it is true the antiscorbutic condiment in milk and fresh vegetables is destroyed by heating or drying, but in orange juice survives boiling.

The alkaloid adrenaline, produced constantly in minute proportion, is known to be a regulator of the arterial system in the
human body: therefore, it is conceivable that the advents are alkaloidal substances or at least substances which exercise regulative functions without being structural elements.

The most suggestive observations of recent times in this direction, however, are those relating to anaphylaxis. If a minute amount of a protein be introduced into the blood stream of an animal, after a certain interval it is rendered so sensitive to the action of the particular protein that if a further amount be injected the animal is killed. A different protein has no lethal effect. In this way a clear distinction can be established between such apparently similar materials as while of egg from the hen and that from the duck. Nay more according to Dakin and Dale—if egg alburnum be treated with weak alkali and the treated material be injected into the animal it produces no sensitiveness either to itself or to untreated egg albumin, and animals sensitised by the latter are not affected by it. The effect of alkali, it is known, is to racemise the albumin; that is to say, to bring about a local change such as that which attends the conversion of glucose into galactose; in the albumin only a few centres can be open to such a change; yet its fit is spoilt thereby and it is no longer operative in the system but runs out unchanged in the urine.

Even in the case of adrenaline only the natural form is operative; the optical opposite form—the other glove—has little effect. Attention may be called here to a striking recent observation in connexion with this alkaloid. When tellurium is combined with methyllic iodide two isomeric compounds are formed, differing in colour and crystalline form: in itself this is a remarkable result and proof that tellurium has unsymmetrical affinities. The two compounds are probably cis- and trans-forms, thus—

\[
\begin{align*}
\text{Me} & \quad \text{I} \\
\text{Me} & \quad \text{I} \\
\text{Me} & \quad \text{I}
\end{align*}
\]

These produce entirely different effects on animals: the one, presumably the trans-form, slows and weakens the heart and the blood-pressure falls. The other, in which the iodine atoms perhaps act together, has the most profound stimulating action on the medulla, giving rise to an increase of blood-pressure and increasing the depth and rapidity of respiration. Generally, before the blood has reached the normal again, a second rise occurs; this is due to the liberation of adrenaline from the super-nal glands, upon which the cis-compound exerts an unique and specific effect not comparable with that produced by any other known chemical. Large doses of the compound, such as 60 milligrammes to a cat, paralyse the whole nervous system—brain, spinal cord and motor nerves (cf. Vernon, Journ. Chem. Soc., 1921, 100).

The effect may be likened to that of secretin, which according to Bayliss and Starling serves to liberate from the pancreas the proteo-enzyme which is active in intestinal digestion.

In fine, whatever the direction in which we look, the influence of structure is paramount and determinative: hence the fixity of our human nature. If organic chemistry teaches us anything it is that no education can alter our mechanism: only changes in the germ can be effective; wherein the patterns are laid down in proteins especially, and so handed on from generation to generation.

(H. E. A.)

Chesterton, Gilbert Keith (1874– ), English author (see 6.112). More recent works:—The Innocence of Father Brown (1911) and The Wisdom of Father Brown (1912), both collections of detective stories; Man Alive (1912); The Victorian Age in Literature (1913); The Flying Inn (1914); A Short History of England (1917); Irish Impressions (1919) and a play, Magic (1913), which was produced at the Little theatre, London.

Cheyne, Thomas Kelly (1841–1915), English divine and biblical critic (see 6.116), died at Oxford Feb. 16 1915. His later works include The Two Religions of Israel (1910); Mines of Isaiah Re-explored (1912); The Veil of Hebrew History (1913) and Fresh Voyages on Infrequented Waters (1914).

Cheyne, Sir William Watson, 1st Bart. (1852– ), British surgeon, was born in the Shetland Is. Dec. 14 1852 and was educated at Edinburgh, where he took his degrees in surgery and medicine in 1875. He also studied at Vienna, Paris and Strasbourg. In 1880 he was appointed to the chair of surgery at King's College, London, and from 1888 to 1890 was Hunterian professor of surgery at the Royal College of Surgeons. From 1900 to 1901 he was consulting surgeon to the South African forces. On the outbreak of war in 1914 he became consulting surgeon to the Royal Navy and in this capacity accompanied the British forces to Gallipoli. He was created a baronet in 1908 and in 1916 received the K.C.M.G.

His published works include Antiseptic Surgery (1882); The Antiseptic Treatment of Wounds (1885); Leeches, Suppression and Antiseptic Disease (1889); Objects and Limits of Operations for Cancer (1896); Manual of Surgical Treatment (7 vols., 1899–1903); besides various papers on the treatment of wounds in war.

Chicago (see 6.118).—With a pop. in 1920 of 2,704,705, representing an increase of 22.6% over the enumeration for 1910 (2,185,283), Chicago easily maintained its position as the second city in the United States. While the city's growth was greater proportionately than that of New York, which was 17.7%, it was considerably less absolutely. The percentage of increase was less than in any other decade of Chicago's history. It was likewise smaller than that of Detroit, 113.4%, and Cleveland, 42.1%, Chicago's closest rivals in the Middle West. In 1920 the negro pop. was 190,994, an increase of 148.5% over the preceding census. This influx of negroes, largely from the South, was due to the great demand for unskilled labour, especially in the packing industry, during the period of the World War when the European immigration was slight. A shortage of housing facilities for these negro labourers was one of the ever-lasting causes of the race riots of 1919 in which a number of negroes and whites were killed. Much of Chicago's growth in previous decades had been due to immigration; this was sharply restricted after 1914. By the annexation of suburban territory, the area of Chicago (both land and water) was increased from 191.4 sq. m. in 1910 to 260 sq. m. in 1920.

Industry and Commerce.—The value of manufactures produced in Chicago increased enormously during the decade, the greatest advance being after 1914, as indicated by the following table compiled by the Chicago Association of Commerce: in which the estimates for 1919 are probably too generous:

</tbody>
</table>
| In 1918 the estimated total for all industries was $4,205,014,000. In 1914 Chicago had 10,114 manufacturing establishments employing 167,919 persons, of whom 312,002, or 19%, were negroes. The cost of materials was $793,470,000, and the amount paid in wages $174,112,000. The Chicago packing plants increased their output while the World War was in progress, as the following figures show:—

| BEEF AND PORK PACKING IN CHICAGO |
| No. cattle. | 1915 | 1914 |
| No. hogs.   | 1915 | 1914 |
| Wheat       | 50,321,000 | 70,704,000 |
| Corn        | 127,773,000 | 95,357,000 |
| Oats        | 124,495,000 | 133,475,000 |
Bank clearings in 1920 were $32,669,253, as compared with $16,108,985,174 in 1915 and $14,399,698,954 in 1910. The construction-completed resources shown by the figures of the Chicago banks in 1920 amounted to $8,183,154,592.

The City Plan.—The most striking feature of Chicago's recent history is the formulation of the plan for the physical reconstruction of the city and the progress of the movement for its execution. This plan had its genesis in a report, issued by the Commercial Club of Chicago in 1909, which was prepared largely under the guiding spirit of Mr. Daniel H. Burnham, Director of Works of the World's Fair of 1893. The first step was the appointment of the Chicago Plan Commission, created by ordinance of the city council in 1909, to conduct the work. An important element of the Chicago Plan, Roosevelt Rd. (formerly 12th St.) was widened to more than 100 ft. between Ashland Ave. and Michigan Ave., a distance of 2 mts., at a cost of $8,303,284. Michigan Ave. was widened to 130 ft. between Roosevelt Rd. and the river and to 141 ft. between the river and Chicago Ave. Widening that part of the street between Randolph St. and Chicago Ave. was a difficult matter, involving the taking of valuable private property, and the construction over the Chicago river of a large two-level bascule bridge. The cost of the Michigan Ave. project was in excess of $16,000,000, paid for out of bond issues of the Chicago Common Council. The New thoroughfare was opened to traffic in 1920. Other street-widening and street-opening projects were under way in 1921.

The situation with respect to railway terminal facilities had long been unsatisfactory. The fact that Chicago is the greatest railway centre in the world, and that the interests involved were conflicting, made the problem exceedingly difficult. In 1911 the new passenger station of the Chicago and Northwestern railway was opened to service, at a cost of $25,000,000. This station, which is a dignified structure, was the project of a single railway. Other terminal projects authorized by the city council were materially in conflict with the ideas of the Chicago Plan Commission.

The railways using the so-called Union Station—the Pennsylvania, the Burlington, the Chicago & Alton, and the Chicago, Milwaukee & St. Paul—had under construction (1921) a new passenger station estimated before the war to cost $85,000,000. The actual cost probably will be nearer $100,000,000. This station is to have a large office building above it. The proposed passenger station of the Illinois Central railway, on the lake front, was planned on a scale large enough to accommodate all the roads—17 in number—using the lake front. The Grand Trunk, La Salle Street, and the Illinois Central project included a programme of electric operation, beginning with the suburban service in 1927 and including a rapid transit service. The estimated cost to the railway of the Illinois Central improvement was $80,000,000.

As a part of the combined move for terminal improvement and lake-front development, the Board of South Park Commissioners planned a scheme of 300,000,000, or more, authorized by referendum vote. The board, in 1921, proceeding to make land by filling the lake outside the Illinois Central right of way, this land to be used for parkways and bathing beaches. The new building for the Field Museum, located on the land on the lake front at the foot of Roosevelt Rd., was completed in 1920 at a cost of $6,000,000, which was provided by the will of Marshall Field. The museum was formerly housed in the old Fine Arts Building, first erected for the World's Fair of 1893, in Jackson Park. The new building opened in May 1921 is 350 ft. wide and 700 ft. long. It is built of Georgia white marble, in the Ionic style of architecture. Some of the areas is to be located a large structure with a seating capacity of 100,000, for which a bond issue of $2,500,000 has been authorized by referendum vote.

The outside dimensions of this structure of reinforced concrete will be 2,000 by 1,080 ft. Other major projects completed during the decade 1910-20 include the following, (name, height in storeys and approximate cost given in dollars):

- Atlantic Hotel, 20, $1,400,000
- Bank of America, 20, $2,200,000
- Continental and Commercial National Bank, 20, $4,500,000
- Fort Dearborn Hotel, 17, $1,000,000
- Insurance Exchange, 22, $3,000,000
- Kenmore, 12, $1,400,000
- Lyndon, 18, $2,200,000
- Mandel (department store), 15, $2,000,000
- Monroe, 14, $1,500,000
- Morrison Hotel, 22, $2,000,000

The present limit of the height of buildings by city ordinance is 250 ft.

One of the most important municipal undertakings of the decade was the Municipal Tuberculosis Sanitarium, consisting of several buildings erected after 1909, in which year a site of 164 ac. was acquired in the north-western part of the city. Its revenues, derived mainly from taxation, amount to more than $1,000,000 a year; in 1920, they were $3,000,000. The building was completed late in 1915 at a cost of nearly $4,000,000, is the Municipal Pier. It projects 3,000 ft. into Lake Michigan just north of the mouth of the Chicago river. The outer portion, 660 ft. in length, is a large dock and provides the means of re-creating the pier which was built in 1919. For the new pier was 288 public schools, in many of which night courses were given to adults as well as to minors. The number of students registered in the Art School of the Art Institute in 1920-1 was 4,267. The number of visitors to the Institute during the year was 1,100,000.

The trustees of the Art Institute administer the Ferguson Monument Fund, consisting of the income from $1,000,000, left by the will of Arthur B. Ferguson, a Chicago businessman, was used for the erection of enduring statues and monuments in Chicago. Among others, two notable pieces by Lorado Taft have been purchased: "The Fountain of the Great Lakes," stands just to the west of the Art Institute; "The Stream," will stand at the head of the midway, between Washington and Jackson parks.

Chicago was the first American municipality to adopt the policy of issuing a bond to direct official encouragement to local art by using public funds for that purpose. In 1914, at the suggestion of Mayor Harrison, the city council appropriated $2,500 for the purchase of paintings and works of art to be produced by artists and sculptors, and an appropriation for this purpose has been made each year since. The purchases are supervised by a commission named by the mayor; it consists of seven members, of which six are appointed on the recommendation of different art groups of the city, including the Art Institute.

The most notable development in music since 1910 has been the establishment of the Chicago Opera Association, at first known as the Chicago Civic Opera. The annual "summer season" of grand opera each year in Chicago, five weeks in New York and five weeks in other places.

Parks and Buildings.—Before 1910 the facilities for bathing in Lake Michigan within the city limits were meagre. In 1920 there were 12 public bathing beaches, 3 maintained by park boards, and the rest by the city government. Clarendon Beach, managed by the city, is the largest. It has nearly 200 lockers and has been used by as many as 23,000 bathers in one day. The small park and playground movement, which was well under way in 1910, developed largely in the following decade. In 1920, in addition to several large parks, the city operated 105 small parks. The parks were divided by the city and by park authorities. Outer park areas for Chicago were enlarged by the purchase, beginning in 1916, of wooded tracts in the outskirts of the city. The total area of such tracts, in 1921, was of 18,023 ac., of which 1,023 ac. are tracts constructed for the Forest Preserve District. The parks then purchased by the city for the preservation of 30,000 ac. to the people's use. A 500-ac. tract of land near Riverside was donated by Mrs. Edith Rockefeller McCormick for the establishment of the Chicago Zoological gardens.

Finance.—The city's corporate finances suffered severely from causes incident to the World War, and more particularly from the loss of revenue from saloon licences, which once contributed as much as $7,000,000 annually. A summary of the more important city revenues and expenditures in 1919 follows:

<table>

1 This does not include expenditures for the larger parks, for the sanitary district, or for some other purposes which are in the hands of the Metropolitan Water Board. The division of the city's tax for the tax year 1918 was as follows: city corporate, 174 cents; state, 141; county and towns, 91; sanitary district, 53; schools and education, 19; school buildings, 10; parks, 10; tuberculosis sanitarium, 11; pensions, 2; public library, 1; and interest, 91.
CHILDREN, LAW RELATING TO

History.—Carter H. Harrison (Dem.), who was elected in 1911 to his fifth term as mayor of Chicago, was succeeded in 1915 by William Hale Thompson (Rep.), who was reelected in 1919. After the United States entered the World War, Thompson was sharply criticized for various actions that seemed to indicate a reluctant support of the war policy of the Government.

The disappearance from the newspaper field of the Inter-Ocean and the Herald left Chicago for a time with only two English-speaking morning dailies, the Tribune and the Herald and Examiner. In 1920 the Chicago Journal of Commerce was established as a morning paper for business men, with no Sunday edition. The Chicago Record (owned by Roy C. Rainey), a morning paper, was published in Feb. 1921 with over 100 students, as a part of the Northwestern University. The Chicago Tribune, of which Joseph Medill was founder, agreed to underwrite the deficit of the school for a five-year period.

CHICAGO, UNIVERSITY OF (see G.125.)—The grounds of the University of Chicago increased between 1908 and 1920 from 60 ac. to 92, so that the university's holdings occupied both sides of the Midway Plaisance continuously for three-quarters of a mile. During the same period new buildings were erected, at an aggregate cost of $2,000,000, for a general library, for a special library (the John D. Rockefeller Memorial), for classics, for geology and geography (Julius Rosenwald Hall), for pathology (the Howard Taylor Ricketts Laboratory), and for a women's gymnasium, rectory and clubhouse (Ida Noyes Hall). Funds amounting to $3,250,000 were in hand in Jan. 1921 for further building projects—a theology building and chapel, the Lawson laboratory for medical research, the Billings hospital (250 beds) and the Epstein dispensary, and the founder's chapel. In 1916–7 funds amounting to $3,500,000 were secured for the development of the medical work of the university, and arrangements were made for the closest cooperation with the Presbyterian Hospital, the Sprague Memorial Institute and the McCormick Memorial Institute. A Graduate School of Social Service Administration, continuing and developing the work previously done by the Chicago School of Civics and Philanthropy, was added to the schools by the university in 1920.

The libraries of the university contained in 1920 685,000 volumes and 200,000 pamphlets. By a novel arrangement of bridges connecting the third floor of the Harper library with adjacent buildings, reading rooms with an aggregate capacity of 900 readers were brought into connection upon the same level and virtually under one roof. The University Press, first to be organized under university auspices in the United States, published 30 to 60 books annually, and 11 scientific journals, the Biblical World and the American Journal of Theology giving way on Jan. 1 1921 to the American Journal of Religion. Beginning in 1914 the Mendelville Theological School completed its summer quarter in the Divinity School, and in 1915 the Chicago Theological Seminary (Congregational) became affiliated with the university. The trustees of the Divinity School were Baptists, theological instruction being given by members of five Protestant denominations to students of every denomination. In celebration of the quarter-centennial of the founding of the university, June 2–6 1916, the university published three volumes: The Quarter-Centennial Celebration of the University of Chicago, 1916, by D. A. Robertson; A Bibliography of the Publications of Members of the University, 1902–1916, edited by G. J. Leising; and A History of the University of Chicago, 1891–1916, by R. R. McLaughlin.

Upon the entrance of the United States into the World War, the President placed the resources of the university at the disposal of the Government for purposes of experimentation and research and for military training, and the members of the university entered actively into war work. President Judson himself led a political and philanthropic mission to Persia in 1918–9, and, in all, 4,335 members of the faculty and students were engaged in war work, while the faculties were in the service of the Government; 70 of these gave up their lives for their country. Between 1908 and 1920, under the administration of President Judson, the university's total resources more than doubled, and, on June 30 1920 exceeded $80,000,000, rather more than $30,000,000 of which was in invested funds. The members of the faculties numbered 2,828. Between 1892 and 1920 87,670 students were admitted and 27,860 were received as post-graduate students, of whom 1,200 of them the Ph.D. In 1920–1 the university enrolled 11,479 students. (E. J. G.)

CHILD LABOUR: see JUVENILE EMPLOYMENT.

CHILDREN, LAW RELATING TO (see G.138).—In the United Kingdom little actual legislation for child welfare was passed between 1908 and 1920, but an immense work was done by the National Society for the Prevention of Cruelty to Children, which now has branches all over the United Kingdom. The worst as well as the most numerous cases of cruelty take place at home; parents and step-parents are worse than employers. The society, authorized by name in the "Children's Charter" (Children Act 1908), was founded at a meeting at the Mansion House in 1884 and dealt with 95 cases in that year. The number of cases dealt with in the year ending March 31 1921 was 18,174 in England, Ireland and Wales, but this was 16,676, or less than in 1920. The number of children dealt with was 101,085. Only 3% of the cases were brought into court. Out of 1,140 prosecutions only 22 failed. The cases are thus divided:

<table>
<thead>

</tbody>
</table>

Cases where improvement took place by warning were 33,757 or 88.4% of the whole. More than half of these (22,295) were reported by the general public, 7,697 by school officials, 5,931 by police officers, 3,916. Discovery by inspectors, 2,355. The children died in 533 cases in consequence of neglect or cruelty.

By the Children Act 1908 any person "over the age of 16 years who has the custody, charge or care of any child under 16 years of age and who causes or procures such child to be assaulted, ill-treated, neglected, abandoned or exposed in a manner likely to cause such child unnecessary suffering or injury to his health in consequence of injury to or loss of sight or hearing, limb or organ of the body and any mental derangement" can be punished by the Assizes by fine of $50,000, or imprisonment for two years, or both. In addition, the child was abandoned in the case, the court may order the child to be committed to a care under the Act (see F.158), for a period not exceeding 14 years.

There is also a provision for emigration. The parent of the child can also be required to contribute to its maintenance, and any pension or source of income may be utilized and charged for the purpose. A court of religious character may be established with or without hard labor to be held in any part of the United Kingdom, and if a warrant may be issued (Sec. 10) in cases where cruelty to a child is suspected, but the child cannot be communicated with. The magistrate may take the evidence of the child, deposition of any witness, and hear the case in the open court, on a medical certificate. Evidence of a child of tender years may be taken although the child is not able to understand the nature of an oath, but there must be some circumstance or other to corroborate such evidence. The court may discharge the case without an order of the child.

The onus of proving that the child is older than 16 is (Sec. 7) thrown on the defendant. The prosecution must be within six months of the offence. The Act provides for the award of costs against a defendant. The Act provides for the award of costs against a defendant.

MISCELLANEOUS:—A penalty is imposed for exposing a child to danger by neglect of care. There are provisions for the punishment of those who abandon, neglect, refuse or allow a child to reside in or frequent a brothel. Two years imprisonment is the penalty for encouraging the seduction or prostitution of a girl under 16 years of age, or for allowing her to be used as a common prostitute or common harlot (see F.17). The magistrate may require security from the parent or guardian not to expose the girl to such risk. Further
precautions are provided for the detention of children in safety during trial and for placing them with respectable relations or friends or with societies or industrial schools or reformatories after wards. The said Board of Education has issued consolidated regulations (Cmd. 617) dealing with:—(a) medical inspection and treatment of children in elementary schools; (b) provision of meals; (c) schools for blind, deaf, defective and epileptic children; (d) physical training; (e) evening play centres.

These various activities for the benefit of children are taken into consideration in "substantive grants" by the Board of Education to local authorities. The evening play centres, initiated by Mrs. Humphry Ward, and largely supported by voluntary contributions, since 1918 have been eligible for such grants. Submission of such classes of child-building regulations (Rules of Ministry of Health 1919) are made by each local authority to the Board or Ministry concerned. Medical records are kept, school clinics and feeding tests are carried on, and children who must be kept completely separate, and the mentally deficient and epileptic. The necessity of beginning the training between the ages of two and five is insisted on by the Board. The curriculum of such classes of child-building regulations for special schools and boarding-houses will be found in the appendices to the consolidated regulations. The Elementary Education, defective and Epileptic Children Acts 1899-1914 make it a duty of the local authorities to see that it makes it incumbent on the parent of such a child over seven to make suitable provision for its education or to send it to a certified school.

Affidavit (see 1,300).—The maximum payment obtainable from the father of an illegitimate child was in 1921 increased to $20 per week, to be collected by an officer of the court.

Adoption.—In 1921 the Report of the Committee appointed by the Home Office was published (Cmd. 1254). It recommends:—(1) that adoption of children should be made a legal and enforceable act, the adopting parents having the rights of natural parents; (2) that the county court as well as high court should have jurisdiction; (3) that subsequent marriage should legitimate any children previously born.

For the law as to custody and guardianship of children, see Women, Legal Status of (K. Th.).

UNITED STATES

There was a distinct advance in regard to the care of children, legislative and otherwise, in the United States during the decade 1910-20. In 1912 the Federal Children's Bureau was established by Act of Congress as a division of what was then the Department of Commerce and Labor. The Bureau was made a part of the Department of Labor when the latter was created in 1913. The Bureau was authorized by statute to investigate all matters pertaining to the welfare of children and child life, and especially the questions of infant mortality, the diseases of children, juvenile courts, and the employment of children in dangerous and other occupations. Miss Julia C. Lathrop (b. 1858), chief of the Children's Bureau from its establishment, was responsible for its success in scientific research and in cooperating with national societies and local and private agencies in the advancement of the interests of children.

Children's Codes.—The new movement for "public codes" (footnote 11) to child laws in 1911 was fostered by the first state to create an official Children's Code Commission to "revise, consolidate and suggest amendments" to the laws of the state pertaining to children. As a result of the work of this commission, a children's code was adopted by Ohio in 1913. By 1921 all the states had followed the example by appointing official bodies to codify laws and to recommend legislation in the field of child welfare. Special attention was given by these commissions to the problems of dependent, delinquent and defective children. The legislation which was enacted after the report of the Minnesota Commission in 1917 made Minnesota a leading state in the public protection and care of children. Here, as in seven of the other states the work is centralized in a special division, a state board of control or whatever state department has general oversight of the state's wards.

Illegitimacy.—There has been some discussion in recent years of the legal position of the illegitimate child in a legal sense. Most of the American states adopted laws which made the issue of certain annulled marriages legitimate, followed the civil-law principle of legitimation by the simple Act of the parents. By this means the inter-state succession between the illegitimate child and the mother. Epstein supports legislation in America has followed English lines. According to Prof. Ernst Freund, of the university of Chicago, the most striking feature of this legislation has been its stationary character, indicative of a lack of thought with reference to the subject during the past century. This stagnation appears to have come to an end in the last few years. In 1917 liberal laws were adopted in 16 states and in 1921 in 16 others. The Illinois law provides that the state Board of Control shall look after the interests of the illegitimate child so that he may have approximated the status of a legitimate child. In so doing this the Board may initiate proceedings to establish the parentage and rights of the child, may cooperate with child-aiding organizations, and, when requested to do so, may appoint a county children's board. The Board of Education is to aid in the objects of the state Board; if there is no county welfare board, the judge of the juvenile court may appoint local agents to
CHILDREN, LAW RELATING TO

cooperate with the state Board. The abandonment statute is made applicable to illegitimate as well as to legitimate children. North Dakota has by legislation declared every child born out of wedlock to be legitimate and entitled to support and to education as if born in wedlock.

The mother of an illegitimate child is entitled to compensation from the estate of the father if he dies intestate. Massachusetts has established a state office to administer the new law. The department has taken over the care of the illegitimate child.

The Supreme Court of Massachusetts has held that the illegitimate child is entitled to the same allowances as a legitimate child, and that the state is entitled to recover from the father the amount paid.

The law has been applied to cases of illegitimacy in various states, and has had a beneficial effect on the health and welfare of these children.

The law has also been applied to cases of bastardy, and has had a beneficial effect on the health and welfare of these children.

The effect of the law has been to improve the health and welfare of these children, and to prevent the spread of venereal disease.

The law has been applied in cases of bastardy in various states, and has had a beneficial effect on the health and welfare of these children.

The law has been applied in cases of bastardy in various states, and has had a beneficial effect on the health and welfare of these children.

The law has been applied in cases of bastardy in various states, and has had a beneficial effect on the health and welfare of these children.
CHILD WELFARE.—During 1905-21 the question of Child Welfare became one of continually increasing interest to social reformers. Before that, the interest in it was mainly from the philanthropic point of view, but the steady decline of the birth-rate in the United Kingdom made it a pressing necessity to endeavour to preserve the vitality of the nation. Though it is true that the efforts to preserve infant life have been in great measure successful, this has not made up, from a population point of view, for the reduction in the number of infants brought into the world; but the most strenuous and successful efforts are being made in order to raise this condition of things to its former serious condition as regards reduction of population than England and she very early directed her energies towards the encouraging of breast-feeding and the supply of institutions for the supply of good milk known as gouttes de lait, a plan which for a time was followed in the United Kingdom. It was about the year 1905, however, that the system which obtains of home visitation, combined with centres for teaching and helping mothers, began to take firm root in England, and, like so many other agencies for social amelioration, it began through voluntary agencies, in which experiments of various kinds could be freely tried. It is to the credit that the work of assisting the mother and child has been developed as it has, and it is on the lines that they started that the work has been followed up. Hampstead, Westminster and other London boroughs set to work in these early days and the records then begin are now proving most useful with the next generation.

Registration of Births.—The necessity for work of this kind depends largely on the keeping of accurate registers, and on their availability. It is only in Great Britain, Germany and France, of European countries, that records of a satisfactory kind can be had. Up to 1857 there were registers of baptisms obtained from church registers, and then from 1857 to 1876 there was no system of birth registration by the parent was made compulsory within 42 days from birth. However, this was not sufficient for early visitation of infants and their mothers, and it was on the lines that they started that the work has been followed up. Hampstead, Westminster and other London boroughs set to work in these early days and the records then begin are now proving most useful with the next generation.

When adopted, the birth had to be notified within 36 hours to the Medical Officer of Health for the district. This Act was largely adopted, and it was made to extend to the whole population in 1915 by the Notification of Births Extension Act. This took the important step of giving definite power to local authorities of levying rates for infant welfare work. Before it became law, although Exchequer grants became available, many authorities were unwilling to incur expenditure; much voluntary work was, however, being carried on, births being discovered through the lying-in and other hospitals as well as through district visiting. In 1921 home visiting was largely done by the local authorities, more especially in the provinces. In spite of all that was done beforehand, however, notification has been the key to all welfare work, and it is the carrying of it out in respect both of births and infectious diseases that has allowed such work to develop.

The World War proved a great incentive to this work by bringing home to Great Britain the need for the preservation of the young population.

Infant Welfare Centres.—The first task has been to coordinate the work at the Infant Centre and the visitation of the mothers in their own homes. The former were often termed "Schools for Mothers," since they specialized in teaching the mothers what was considered necessary for good motherhood. It was soon found that medical advice was required in addition to the usual classes for cookery, garment-making, etc., and that infant consultations were of little use without helping the mothers to carry out the advice given in their own homes. The medical notification of such mothers followed. Much was done to All these alarming conditions that were discovered in children of school age should be dealt with before the child came to school, and, indeed, that it was necessary to go back to ante-natal conditions. Some of the advanced health centres had already realized this fact and were carrying on that work. It was brought home to those interested that the work required was preventive far more than curative, and that the whole social condition of the family was involved—the health and habits of the parents, sanitation, and general surroundings. Above all the housing question was, it was felt, intimately bound up with this question. Hence, since 1907, all the work is based on the foundation of and the progress of social ameliorative efforts that were being made with the end of bettering the chances for the infant, as well as the agencies for invalid aid, country holidays and so on for the child. It is certainly true that curative work is required as well, but the child welfare movement primarily aims at bringing into the world a healthy population and endeavouring to preserve it for healthy and natural conditions. At the same time it must be in touch with hospitals and other directly curative agencies.

Though every birth may be notified to the Medical Officer of Health, some (about 20%) are not as a rule visited. Visits are usually made about 14 days after birth, since before that the mother is being attended by a midwife or doctor. A record card is presented in each case, and this has to be carefully filled in. This card is preserved and kept up to date till the child goes to school, when the information it contains is invaluable to the school medical officer.

The "Centre" varies in size from two rooms to many. There are now many large buildings devoted to the work, in which there are not only the waiting rooms and doctor's rooms of the old days, but also a weighing room, toddlers' room, where the older children can be looked after with comfort, a room for older children, a play room, a nursery, a room for the children can sleep. Then at a large centre there is a dental room, a pre-natal consulting room, and frequently observation wards, where sickly children are kept for a short time, and mothers are taught how to keep the children and servants' accommodation. Sometimes there is also accommodation for mothers. Then a day is often given up for the medical examination of older children under school age. Thus a large centre has become a varied conglomeration of activities, and it probably has a small branch centre dependent on it, so that no mother may have more than a short distance (say a mile) to walk. Much stress is laid on the matter of clothing, and every effort is made to obtain the best patterns for the clothing of both infants and mothers and older children and then to get the mothers taught to use them. A system of card-indexing for record is adopted, so that all information is easily accessible. Each child is identified by a number, a trained teacher is always there, and in the large centres usually, employed. In addition, lectures on health matters are given to the mothers as well as voluntary or other social workers. Ante-natal work brings the welfare work into touch with the work of doctors and midwives (see Nursing), and though in some cases it leads to midwives being appointed for the work of the centre, the usual plan is simply to see that the woman in some manner secures adequate and suitable provisions for her confinement. If a medical examination is required by a midwife for her patient, although the power to pay doctors' fees was conferred by the Maternity and Child Welfare Act of 1918, the arrangements for providing it are very limited, and the woman therefore often prefers to take advantage of the opportunities offered at the Child Welfare Centre. At these centres nursing mothers are sometimes provided with meals, though there is still a difference of opinion as to the desirability of doing so. Under the Act just quoted these dinners may be paid for from the rates. The provision of milk has also been frequently carried out. The first form of milk used was as "D'heygere," a milk manufactured by dried milk, which is often bought wholesale and sold at cost price. The question of how far milk depots are desirable, and
whether they discourage breast-feeding, is still being discussed. The shortage of milk during the World War and its high price made the question acute.

The maternal and infant centre is in some cases provided with a garden where the mothers can sit with their little ones, or where infants can play about. The oldest welfare centres on this side have the rooms and an outdoor play ground and a place for playing. Occasionally a play centre for young children is combined with an infant centre. These play centres are instituted in connection with the Education Authority, and are under the control of the local education committee, and may be acquired and supported by the local authority they are sometimes given by private donors and occasionally equipped by them or by bodies like the Carnegie U. K. Trust. The movement was naturally restricted for a long time, but now the number of centres seems to be increasing. It is clear that the infant welfare work in Great Britain is not the mechanism alone. An educational committee has been formed up the infant welfare work in Great Britain without taking into consideration also the work of the Education Authorities to whom power was granted to carry on the work of medical inspection in 1908. As with infant centres, the work already done is far less than what could be done if the individual homes were essential if good was to be done, and very often the infant visitor carries out the visiting for both infants and school children. There are good Maternal and Infant Welfare Societies and borough councils to do work which requires visitation. Unless care is taken there is serious danger of overlapping.

Training of Visitors.—The training of infant visitors cannot as yet be said to be standardized. To training of a nurse. The Midwife, but the hospital experience alone is not sufficient, any more than is that of midwifery or the sanitary diploma. The Board of Education has now issued a regulation for the training of health visitors which is not made up for the reduced number of babies born. The chief cause of child mortality is (1) developmental, wasting diseases and convulsions; (2) diarrhoea and enteritis; (3) measles and whooping-cough, bronchitis and pneumonia. One-third of the deaths during the first year of life is due to the last mentioned disease only. What is called the "infant mortality-rate" is the number of infants dying under one year of age per 1,000 infants born. The following table shows the infant mortality-rate for England and Wales and the birth-rate for the corresponding years.

<table>

This shows that the birth-rate has tended to fall as well as the infant mortality-rate, but the fall of the latter is remarkable and may be ascribed partly to the improved sanitary conditions during and since the war, and partly to the definite work for child welfare, as well as to the decrease in the number of births. Where there is overcrowding and bad sanitary conditions child welfare work seems to do little to prevent infant mortality. The chief cause of death among children in Great Britain is tuberculosis. The maternal and infant work is also of great importance among illegitimate infants. The Ministry of Health has approved a number of Homes for single women before and after marriage as well as hostels where the mothers and children can stay. In these the mothers and children can be cared for, and the idea is that. The infant mortality amongst infants in England and Wales is found in the northern county boroughs which include the great industrial centres. The numbers in the large towns and boroughs with good midwifery and ante-natal service and better social conditions, the large infant mortality that now exists may be decreased, for it is clear that the health of the mother and child is the best towards the end of pregnancy and the child's birth. It is the duty of the Medical Officer of Health in respect of such work. The superintendent of the county nursing association may also be appointed inspector of midwives for the county. Usually the number of infants is not great enough for the local education committee to see the necessity of having such an inspector, and in such cases the inspector of the Education Authority may be called upon to undertake the task. It is difficult to say whether the whole nursing service should be placed under the councils and the voluntary element done away with; others are strongly opposed to such a policy as tending to bureaucracy.

Organisation of Child Welfare Work.—The movement has made rapid progress. It was estimated that in 1921 there were in England and Wales 578 statutory centres, thousands of mothers' clubs, local councils, and 63,763 were worked by voluntary associations.1 Municipal centres are carried on by the Public Health Committee under the local authority. The county, city or borough council elects a committee for Public Health in 1918, which in the Maternity and Child Welfare Act, a statutory committee was made necessary for the purpose of carrying out its requirements, the majority of whose members must be members of the council. Before the 1918 Act these duties fell on the Public Health Committee, though sometimes it devolved them on a sub-committee which might become the statutory Welfare Committee. At least two members of this committee must be women and it has to report to the Public Health Committee. In counties this Welfare Committee is usually a separate one, and is granted considerable power. The staff of visitors works as part of the staff of the department of the Medical Officer of Health. In general the visitors enter the house and get the mothers to bring their infants to the centres and in some places half of those visited do so. Of course, not all the children necessarily go before the doctor on each occasion. There are many variations in the manner in which the centres are conducted, depending upon the nature of the area. In the country the visits usually take the form of visits to the school and tuberculosis visiting. The visitors not usually stationed in small towns, but it has to report to the area and visit around these. "Centres" may or may not be established in these towns or villages. In most counties there are nursing associations for the supply of parish nurse and midwives, and the Education Committee on children who are received into the centres.

1 During 1920 fifty new maternity homes with over 500 beds were provided by local authorities and voluntary agencies in England and Wales.
2 On June 1, 1921 there were 1,789 infant welfare centres in England and Wales, 710 of which were voluntary.
Chile

Act of 1911 have no doubt been contributory measures to the improvement in this matter, as well as the School Medical Service that was organized in 1907, and the Maternity and Child Welfare Act of 1911; the number of women in receipt of maternity allowances remained about the same during the last 25 years, and there is a large amount of abortion, miscarriage, etc., and many children are disabled and blind. Abortion is sometimes practised in the first trimester of pregnancy. The mortality-rate from all causes remains between 4 and 5 per 1,000 births. The births necessary to be taken are secure (1) the supervision of pregnancy and the wise administration of maternity benefit; (2) the supervision of midwives and the efficient management of maternity homes; (3) health visiting and nursing and (4) the establishment of infant welfare centres. In this work voluntary assistance is most desirable.

It is important to note that by the Ministry of Health Act of 1910 the physical care of maternity, infancy and childhood is now under one state department and the work of the Education Authority is co-ordinated so far as possible with that of the Sanitary Authority. The district health and education deals with the same subjects, and in all urban and rural areas of the country where both the same centres and clinics are now used for both. There is a special department of the Ministry for supervising this work. A scheme of maternity and child welfare has been inaugurated in every county (excepting one county in Wales), and in every county borough and many of the large urban districts. On March 31, 1920 not only were there 1,754 maternity and infant welfare centres and 3,359 visits as stated before, but to the day nurseries or crèches, and 89 maternity homes with 1,360 beds.

The hospital provision for infants is not (1921) large, and there is often a high mortality found in hospitals owing to the spread of infection among those who are rushed into them. Abroad, however, many have been provided for infants and young children in connexion with welfare schemes. In cases where young children must be separated from their mothers a good foster-mother sufficiently remunerated is required. In most cases the most suitable guardian is the local authority.

Scotland.—The Maternity and Child Welfare Act of 1918 does not apply to Scotland, but in the Notification of Births (Extension) Act of 1918 it is provided that the county authority may make such arrangements for the health of the infant, as are sanctioned by the Local Government Board for Scotland, for attending to the health of expectant mothers and nursing mothers and of children under five years of age within the metropolis. Section 7 of the Scotland Act 1908.

As in England, Exchequer grants-in-aid are given for certain services in connexion with child welfare, and the extent to which these obligations of local authorities are met is a matter of importance. There is, however, an important difference between England and Scotland. In England certain institutions such as schools for mothers and play centres receive grants direct from the Board of Education and are under its control. In Scotland all the institutions included in a child welfare scheme were controlled by the Local Government Board and are now controlled by the Ministry of Health. In Scotland, also, the grants are only made to the local authorities and not, as in England, to voluntary institutions. These grants cannot exceed 50% of the local authority’s approved outlay. The schemes that are carried on are similar in character to those in England. The infant mortality for children under one year old (registered) is considerably higher than in England and Wales and Ireland though it is gradually decreasing. In 1917 it was 107; in 1918, 100; in 1919, 102; and in 1920 it was 92.

Since operations under the Scottish Education Act of 1918 there has been a considerable accession of energy in the matter of attending to the health of school-children, and that Act gives power to the Education Authority to carry on rural schools. Education Authorities often take advantage of the services of district nurses in following up their cases in the rural districts, and this is sometimes also done by the county council in regard to its schemes for infant welfare. In such cases the nurses may work through a Child Welfare Federation. The Highland districts naturally present special difficulties owing to the scattered nature of the population and the difficulty of providing adequate attendance.

The larger voluntary societies, such as the Women’s National Health Association and the United Irishwomen, working in connexion with infant welfare, and in establishing milk depots, etc., and since the establishment of the movement, have submitted schemes of a comprehensive character.

See Annual Report of the Chief Medical Officer 1919-1920 (Ministry of Health); First Annual Report of the Scottish Board of Health 1919 (Appendix to ditto pub. 1920); Twenty-fifth Final Annual Report of the Local Government Board for Scotland 1919 (pub. 1920); Annual Report of the Local Government Board for Ireland 1918-1919; Child Welfare Movement (1921) by Nora Milnes, "Child Welfare from the Social Point of View" (1920); Edith V. Eckhardt, "The Mother and the Infant" (Social Science Library 1921); Carnegie United Kingdom Trust’s Report on "The Physical Welfare of Mothers and Children" for (1) England and Wales, E. W. Hope; (2) Scotland, W. Leslie Mackenzie; (3) Ireland, E. Coey Bigger (1917). Sir J. E. Gorst, The Children of the Nation and how their Health should be Promoted by the State (1906); Margaret Macmillan, Early Childhood (1906), The Nursery School (1919). (E. S. H.)

United States

In the field of child welfare considerable progress was made in the United States during the decade 1910-20. The first work of the Federal Children’s Bureau (established 1912) was a number of remarkable studies on infant mortality, particularly its social and economic aspects. As a result of emphasis by the American Medical Association, by the Children’s Bureau and by other children’s agencies of the necessity of basing any programme for reducing the infant mortality upon reliable statistics, all but three of the states had adopted in 1921 the uniform registration plan recommended by the Census Bureau, and all but five states now have good registration laws.

Popular education in child care has been greatly developed in the last decade. Aided by the Children’s Bureau, Baby Week Campaigns were inaugurated in a few large cities in 1914. In 1916 the General Federation of Women’s Clubs and the Children’s Bureau cooperated in a nation-wide “Baby Week” campaign, as a result of which Baby Week was observed in every state. In 1918 the Bureau and the Women’s Committee of the Council of National Defense cooperated in a year’s educational propaganda known as “Children’s Year.” As a result of the interest awakened through these campaigns as well as by the previous efforts of many child welfare organizations, child hygiene divisions were established by law in 30 states from 1918 to 1921, as compared with eight states between 1912 and 1918. There were also in 1921, special child hygiene divisions in the health departments of 45 municipalities. The Children’s Bureau report on maternal mortality in 1917, followed in 1919 by one on maternity benefit systems in certain foreign countries, resulted in a general demand by women’s organizations for public provision for the protection of maternity.

Prior to 1910 pre-natal care for mothers was confined to maternity hospitals. During the decade 1910-20 there were demonstrations in Boston, New York, and a number of other cities of the reductions that can be effected in maternal mortality and in infant mortality due to maternal causes, through maternity centres, where pre-natal and post-natal instruction and care have been given. As a result of the widespread interest in the subject, bills have been introduced in a number of the state legislatures; and the Sheppard-Towner bill, providing for Federal aid toward public provision for maternity and child care, was passed by the U.S. Senate in 1912. Medical inspection of school-children was in 1921 required by law in 39 states, and the first legislation had been passed making specific provision for dental inspection. Without this specific legislation increased attention has been given to the care of school-children’s teeth in recent years. Nutrition clinics for undernourished children have been widely established during the last five years in connexion with schools, dispensaries, and child welfare agencies. In the year 1915 eight states were studying "Ills

as provided in the constitution, article 65. Before a new election for the president could be held, in accordance with the requirements of the constitution, Sr. Albano died on Sept. 6 and was succeeded by Sr. Don Emiliano Figueroa, Minister of Justice, who held office until Dec. 23, the date of the inauguration of Dr. Ramón Barros Luco, the new president elected Nov. 15. Dr. Luco had had a long career of public service starting as a Liberal deputy, and serving as Minister of Finance under President Federico Errázuriz and President Domingo Santa María, as Minister of the Interior and premier under Presidents Balmaceda and Jorge Montt, and later premier of several short-lived governments. This marked the triumph of the Liberal over the Conservative and Clerical party. In 1910 several other events of general significance occurred. One was the opening of railroad traffic through the Transandine tunnel, connecting Buenos Aires with Santiago and Valparaíso. The piercing of the tunnel occurred late in 1909 and the first trains were run through in 1910, thus completing a remarkable feat of railway engineering and realizing a dream of many decades. Another important event was the celebration of the centennial of Chilean independence, lasting throughout the month of Sept. but concentrating chiefly on the 18th, the centenary of the transference of governmental power from the Spanish governor to the locally elected junta. Aside from its effects in stimulating patriotism and national pride, the celebration was made the occasion for according special honours and attention to the Argentine nation and its representatives; this strengthened still further the rapport between the two nations which dated from the settlement of their long-standing boundary dispute in 1902. In 1911 the Chilean Government paid 2,775,375 bolivianos in settlement of the long-standing Alsop claim, in accordance with the award of King George V. of England. This marked the termination of a dispute which had for years been one cause of bad feeling between the Governments of Chile and of the United States. In 1913 there was completed and put into operation the railroad between Arica, a seaport in the provinces secured by Chile from Peru in consequence of the war of the Pacific, and La Paz, the principal city of Bolivia. This line, which has a total length of 264 m., was built by the Government of Chile with the cooperation of Bolivia; until 1918 the control of the entire line was to remain with Chile, after which date Bolivia was to have control of the portion within her territories, under conditions stipulated in the treaty of 1905. The provisions of this treaty with reference to this railroad and free access to the sea for Bolivia were among the factors that led to further attempts to settle the long-standing controversy between Chile and Peru with regard to the provinces of Tacna and Arica, especially in the years 1905 and 1908 (see TACNA-ARICA). In 1913, the two countries, unable to come to any agreement, decided to postpone the settlement of this question for another 20 years. It was, however, reopened, as will appear later.

At the outbreak of the World War a considerable section of opinion in Chile was inclined to be favourable to Germany. A number of factors combined to make this situation a natural one. The Chilean army had long been trained by Prussian officers and modeled on Prussian lines. German scholars held important positions in the institutions of higher learning in Chile, and many native teachers had completed their education in German universities. A considerable homogeneous and thrifty German population, moreover, was concentrated in the southern portion of the country and a well directed propaganda system kept the German point of view before the nation. The clergy, also, were in large part favourable to the cause of Germany against a nation like France which had in recent years adopted such a radical anti-clerical policy. Finally, there was the commercial factor, for in 1914 Germany headed the list of nations in the value of goods shipped to Chile and ranked third in the value of the Chilean goods imported. With this commerce, totalling in that year, in spite of the outbreak of the war, some $44,000,000, or considerably more than a fifth of the total foreign commerce of Chile, was combined a quasi-political propaganda which had not been matched in any way by the other European nations.

The sinking of the German cruiser "Dresden" by British warships in the territorial waters of Chile, which had to be admitted by the British Foreign Office to be irregular, caused a protest, but the incident was adroitly handled in London by the Chilean minister, Augustin Edwards, who, throughout the war, was a friend of the Allies. The reduction of the foreign commerce of Chile by the blockade caused serious economic disturbances almost at the very outset of the war, and especially in 1917. A gradual change in the popular attitude in Chile began to make itself felt, however, in the last two years of the war, although Chile, having virtually no ships engaged in European trade, did not come into immediate conflict with the German submarine policy as did some of the other Latin-American states. Officially Chile maintained a position of strict neutrality, though protesting emphatically against the announcement of German unrestricted submarine warfare, on Feb. 8 1917. Upon the declaration of war by the United States in April 1917, Chile again made a declaration of neutrality.

Meanwhile, in 1915 Sr. Juan Luis Sanfuentes, the candidate of the Liberal Democrats or new Balmacedists, succeeded to the office of president for a five-year term beginning Dec. 23. The political campaign was marked by great excitement and some disorder, including the assassination of one of the deputies. The victory in the election was due to a coalition of the Liberal Democrats with the Conservatives and Nationalists, as against a combination of Radicals, Liberals and Democrats.

The law for the conversion of the currency which was to have gone into effect in 1915 was again postponed for a period of two years. The financial and industrial situation of the country was extremely grave in 1915. Some relief was experienced from the sale of the battleships in construction in British yards which were requisitioned for war purposes by the British Government. The year 1916 saw improvement in the commercial situation as shown by an increase of about $25,000,000 in the value of imports and of nearly $65,000,000 in the value of exports, due chiefly to the allied demand for materials used in the manufacture of munitions. This was the highest figure ever reached up to that time in the export trade of Chile, but it was greatly exceeded the next year and even more in 1918, when the total value of the exports was more than double the value reached in any year prior to 1916.

The year 1917 saw still further improvement in financial and business conditions, though the conversion law was again postponed for a two-year period. The year was again marked by the instability of cabinets which has been so characteristic of the governmental history of Chile. An agreement was reached for the resumption of friendly relations with Peru which had been interrupted in 1916, as on other numerous occasions, over controversies growing out of the old-standing Tacna-Arica dispute. The year 1918 was marked by renewed difficulties with Peru in consequence of anti-Peruvian riots at Iquique and Antofagasta, culminating in the mutual withdrawal of consular agents from each other's territories. Both governments made it clear that a very numerous, coalition cabinet in April being organized under Arturo Alessandri who was elected two years later to the presidency of the republic. In 1919 the Tacna-Arica controversy again threatened to disrupt the peace of South America. The publication of the secret treaty of 1904 between Chile and Bolivia with reference to the disputed provinces and an outlet to the sea for Bolivia, combined with disturbances involving Peruvians in those areas, aroused animosities anew. In the same year Chile concluded a treaty with Great Britain providing for a permanent peace commission to settle such disputes between the two countries as could not be adjusted through diplomatic channels.

Chile suffered severely from after-the-war readjustment, involving there, as in other countries, labour troubles and radical demonstrations. The year 1920 was marked by one of the most interesting and in some respects the most significant of all the presidential elections of Chile. The contest was be-
between Sr. Arturo Alessandri, the candidate of the so-called Liberal Alliance, comprising the Radical and Democratic parties and a portion of the Liberals, and Sr. Luis Barros-Borgono, the candidate of the so-called National Union, made up partly of Liberals and largely of Conservatives. Sr. Alessandri was distinctly the exponent of the labour and middle classes. Sr. Barros-Borgono belonged, as had virtually all former presidents of Chile, to the dominant political aristocracy, comprising the long-established families closely affiliated with the landowners and the clergy. The election was held June 25 and the announced electoral vote was 179 for Sr. Alessandri, and 175 for Sr. Barros-Borgono. Under the constitution of Chile, as in the case of the United States, the electoral vote for president is to be canvassed by both Houses of Congress sitting jointly, and in case no candidate receives an absolute majority the powers of election devolve upon Congress. Now with the electoral vote so close and the validity of various electoral votes questioned, a situation arose almost identical with that which occurred in the United States in the famous Hayes-Tilden contest in 1877. The Senate was openly in favour of the candidacy of Sr. Barros-Borgono, and public opinion, which had been raised to the highest pitch, demanded that the counting of the electoral vote should be delayed until the matter could be passed upon by a special court of honour, a proposal put forth by Sr. Suarez-Mujica, a former minister of Chile to the United States. Here again was a reproduction of the extra-legal election commission in the settlement of the Hayes-Tilden dispute. This court of honour, after a strenuous period of activity, finally decided on Oct. 4 in favour of Sr. Alessandri by a vote of five to two, as having received a majority of one electoral vote, 177 valid votes against 176. Congress accepted this finding two days later and declared Sr. Alessandri elected. For a brief period popular excitement ran at fever heat and a general strike was even instituted. The election was remarkable, alike in the manner of its final settlement and in the character of the man elected to the chief magistracy. It was remarkable also, because of the general participation of the labour and middle-class eleoters, and a relatively greater freedom from the practice of buying votes than had ever been experienced before. It was looked upon, therefore, as a distinct triumph of democratic principles.

One further development at the close of this period is worthy of mention, namely, the relation of Chile to the League of Nations. Chile, not being a belligerent in the World War, and having adhered to her policy of neutrality, was, of course not represented at the peace table. Nor was she, for the same reason, among the original members of the League. She was, however, among those specifically invited by the Covenant to accede thereto. In the message of President Santuines approved the League. This suggestion prevailed, and Chile joined the membership of the League Nov. 4 1919. She was represented at the first meeting of the assembly of the League of Nations in Geneva Nov. 15 1920 by a delegation headed by Sr. Antonio Huneus, Minister of Foreign Affairs, who was honoured with the chairmanship of the commission on the admission of new states.

Population.—In the period between the census of 1895 and that of 1907 (the last official census), the pop. of Chile had increased from 2,711,145 to 5,459,279 showing an annual increase of 1.52%. The estimated pop. on Jan. 1 1918 was 4,038,050. The greatest absolute increase was shown by the province of Santiago in which is located the capital. An increase of more than 100,000 inhabitants was recorded for that province in the interval between the last two censuses. Other provinces that showed a large actual increase were Antofagasta, Valparaíso, Concepción, and Valdivia, while the province of Maule showed a decrease. The provinces of Atacama and Talca showed an estimated decrease in the 10-year period from 1907 to 1917. The great bulk of the population was still comprised within the 12 provinces in the Vale of Chile from Coquimbo to Concepción inclusive, although Antofagasta, Valdivia, and Llanquihue showed a larger actual increase than did any of these 12 favoured provinces except Valparaíso and Santiago and a much larger proportionate increase than any of them. The territory of Magallanes showed an increase of more than 300% between 1895 and 1907 and a further estimated increase of nearly 100% in the succeeding decade. The percentage increase from 1885 to 1907, 63.4% in 1895 to 1907 and 42.3% in 1907 to 1918 and as the estimated population for the 47 largest towns in 1918 showed a greater percentage of increase than for the country as a whole, the process of urbanization apparently continued.

According to the census of 1907 there were 134,324 foreigners in the country, representing 4.8% of the population. The chief nationalities represented were Peruvians, Bolivians, Spaniards, Italians, Germans, English, French and Austrians in that order named. In the 10-year period 1907-19 there was a decline in the marriage-rate and in the birth-rate, but an even greater decline in the death-rate, so that the excess of births over deaths was increased. The total excess of births over deaths in this period amounted to more than 350,000.

Communications.—By the end of the year 1918 there were in all 8,512 km. of railway in Chile of which the Government controlled 4,557 km. and private lines the other 3,954 km. The private lines were almost altogether in the three provinces of Tarapacá, Antofagasta and Atacama, in the two former of which (containing 97% of the total mileage of private railways) there were no Government-owned lines at all. Every one of the provinces had some railway mileage within it, varying from 9 km. in the desert province of Atacama to 1,810 km. in Antofagasta. One effect of the World War was virtually to suspend construction of all kinds of railways. In the six years 1909-14 the Government lines showed a loss of from 5,900,000 to 10,000,000 pesos (1 peso nominal = .6d. ed) each year. During 1915-17 they made profits of 4,738,423, 3,687,340, and 1,061,502 pesos respectively; but in 1918 they lost 9,124,365. During the 10 years 1909-18 the private railways showed profits from 9,000,000 to 20,000,000 pesos a year. As no explanation of
these figures is supplied, no comparisons can be based upon them. There were in 1918 nine electric traction companies carrying 78,382 passengers concentrated for the most part in the cities of Valparaíso, Concepción, and Santiago. There were also 35,120 km. of public roads and 70 km. of navigable rivers. The length of the Government telegraph lines had increased to 37,000 km, operating through 370 offices and employing a personnel of 1,395. The private telegraph lines had in the same year an extent of 9,078 km. with 214 offices and 917 employees. In the years 1914-18 the number of telegrams sent increased in excess of over income from 100,000 to 1,750,000 pesos a year, while the private lines showed an excess of income over expenditure of from 1,000,000 to 4,000,000 pesos. No figures are available to show the number of passengers reaching the official companies' services repaired by the school. The number of post-offices in 1918 totalled nearly 1,000, with 2,222 men and women employed. The postal revenues in that year amounted to 5,639,897 pesos, which came on top of the same 4,532,694 pesos of the merchant marine in 1918 included 55 sailing vessels of 23,381 tons and 95 steamships of 46,587 tons total. The total number of vessels entered at and cleared from Chilean ports in 1918 amounted to 26,799, aggregating something over 25,000,000 tons. These figures were far below those which had been attained previously to the outbreak of the World War (1914). The four ports in which the entries and clearances exceeded 2,000, in the year 1918 were Punta Arenas, Valdivia, Iquique, and Antofagasta, in the order named. Over half of these ships were Chilean, Great Britain ranking next, and Germany, of course, wholly eliminated from her former strong position by the war.

Commerce.—The effect of the war on the foreign commerce of Chile was of such a nature that statistics for the years 1914-8 must be regarded as largely abnormal. After a period of rapidly rising figures the total trade of the republic declined rapidly, and a drop of about 20% in the total figures, followed in 1915 by a further decline which brought the totals below the figures attained in 1908. Then followed a marked increase in 1916, during which year a pre-war year, and a tremendous increase in the two following years. In 1918 the total foreign trade of Chile amounted in value to 1,235,669,982 pesos gold, considerably more than double the value 10 years before. Of this sum imports represented 439,974,-

Mining.—In 1917 there were in Chile 38,021 mining properties, the value of whose lead was 1,040,551 pesos. The value of the production of the principal minerals in 1917 is shown by the following table:—

Government and Education.—In 1918 the police force of the republic was exclusive of the municipal police and the federal police, carabineros, numbered 8,194. The army the same year comprising 996 commissioned officers of the line, and 82 officers of the intendancy or other service was 18,826. The naval in 1918 commissioned officers and a total force of 5,595 men. The ships were 52 in all, of which one was classed as a battleship, four as cruisers, two as armoured cruisers, two training ships, three transports, one gunboat, nine destroyers, six submarines, five torpedo boats, and the rest of a miscellaneous character, the total tonnage being 129,080. The value of the public works constructed in 1918 was 24,452,276 pesos, of which 22,857,102 pesos were for roads, and 252,699,266 pesos for telegraph, roads and bridges, and public buildings. In 1918 there were 3,581 primary schools in Chile, of which 3,085 were Government schools, and 306 private schools receiving subventions; there were 287 secondary schools of which 12 were Government schools and 86 private schools receiving subventions; and 19 institutions of higher learning, of which 12 were Government institutions, and one received subventions. The total number of students of the primary schools in 1918 was estimated at 306,234, almost equally divided between boys and girls, of which number 182,473 in secondary schools. The number of pupils in secondary schools was estimated at 44,723, of whom 33,756 were in public schools. The students enrolled in 1918 in the institutions of higher learning numbered 4,875, of whom 4,233 were in Government institutions. There was a total of 105 daily papers, 81 semi-weeklies, 27 weeklies, and 49 semi-monthly weeklies. There were 244 newspapers, and a number of miscellaneous publications, making a grand total of 698 periodicals of various kinds. The number of hospitals in the republic in 1917 was 190 with a personnel of 3,973, equipped with 2,446 rooms and 1,465 beds. The total number of patients admitted in 1916 was 108,914. There were in 1916 110,000 inmates of various charitable institutions.

Finance.—On Dec. 31 1918 there were in circulation 227,688,421 pesos in paper currency. The total amount of gold in the currency fund at the end of 1918 was 111,272,223. The Government expenses for 1918 amounted to 221,616,150 gold pesos and the national debt stood in 1917 at 625,712,416 gold pesos.

Bibliography.—Among the large number of works that appeared between 1910 and 1920 dealing wholly or partly with Chile, the following are especially worthy of mention. (a) (1918); (b) (1915); (c) (1918); (d) (1918); (e) (1917); (f) (1911); (g) (1916); (h) (1916); (i) (1916); (j) (1916); (k) (1916); (l) (1916); (m) (1916); (n) (1916); (o) (1916); (p) (1916); (q) (1916); (r) (1916); (s) (1916); (t) (1916); (u) (1916); (v) (1916); (w) (1916); (x) (1916); (y) (1916); (z) (1916).

CHINA (see 6.166).—In the absence of any systematic census by the Chinese authorities the figures periodically published for the population of China must always be regarded as rough estimates. The Imperial Census of 1911 was a census calculated to total the population of the country, including the three Manchurian provinces (10,000,000), to be 445,873,730, but the arguments advanced by Mr. Rockhill in 1904 still justify doubts as to the evidence on which these estimates are based. Chinese records since the beginning of the 17th century show that at various periods the estimated pop. of the empire varied between 250 and 450 millions, and that its density always increased rapidly in times of peace and plenty only to be reduced with equal rapidity by outbreaks of floods, famine or civil war. Thus, in 1875 the pop. was believed to be about 430 millions, but nine years later—after a period of peaceful prosperity—had been devastated by the Taiping rebellion—it was reckoned at 260,000,000. It is probable that in the period immediately preceding the revolution of 1911, the number of inhabitants in most provinces had attained to something approaching its normal maximum, but 10 years'
incestant civil strife with widespread brigandage by lawless troops (in addition to the floods of 1911 and the severe famine of 1920–1 in the northern provinces) must have produced a great increase in mortality. Since 1907 there has been a steady migration of agricultural settlers from the congested provinces, especially Shantung, into Northern Manchuria, Eastern Mongolia and Turkestan. The number of Chinese residents abroad was estimated in 1918 at about 9,000,000: of these, 2,258,000 were in Formosa; 1,500,000 in Siam; 1,825,700 in Java; 1,000,000 in the Straits Settlements, and 1,100,000 in the East Indies. The estimated number of Chinese in Australia was 35,000, and in Canada 12,000; in the United States it was in 1920 61,686.

Social Life and Education.—The political upheaval of the revolution of 1911 (see below, section History), the abolition of the monarchy and the abolition of the classical system of examination and civil service, created a general feeling by educated classes a relaxation of the ethical restraints and a disturbance of many of the popular beliefs upon which the social system of the Chinese is founded. The irreligion displayed towards the canons of the sages and the Confucian doctrines (including ancestor worship) by the youthful iconsoclasts who came to power with the proclamation of the republic, became specially reflected in the widespread and increasing indiscretion of the student class, and in a loosening of that parental authority which is the keynote of the family system and of China’s ancient civilization. Believing that the path to public office—common goal of ambition in China—would henceforward lie not in study of the classics but in the acquisition of “western learning,” men of wealth and influence were naturally disposed to allow their sons to acquire that learning, even if in so doing they should lose their reverence for the immemorial customs and ceremonial observances prescribed by the ancestral cult, and fall short of that filial piety which, according to the Confucian teaching, is the foundation of a well-ordered society. One of the first results of the revolution was therefore to give a fresh impetus to the activities of European and American missionary educational institutions and to extend the influence of western ideas in many directions; these found expression in the Government’s endeavours to replace Chinese social customs and ceremonies by those of the West. After 1916, the increasing demonstration of the central Government produced a corresponding unrest and turbulence amongst the student class, which on several occasions successfully asserted its claim to intervene in questions of high policy and in foreign affairs. The strikes and the boycott of Japanese goods organized by students and young journalists (chiefly at the treaty ports) in 1919 afforded significant evidence of the relaxation of parental authority amongst the educated class of the urban population.

The prevalence of opinion exists as to the extent of the influence of European ideas upon the social life and opinions of the agricultural and artizans classes, who constitute the great majority of the Chinese people, but it may safely be asserted that, generally speaking, the deep-rooted conservatism of the masses remains impervious to the chances and changes of the political world, and that in so far as they conform to the new ordinances promulgated by their rulers (as, for example, in the cutting of the queue), their acquiescence implies a desire to avoid trouble rather than any wide-spread desire for change, or any general departure from the philosophy of life prescribed by authority of immemorial tradition.

The republican Government’s attempts to introduce by law innovations which run counter to ancient usage—such as the adoption of the western calendar and the proclamation of national holidays in connexion therewith—have been more honoured in the breach than the observance. Except at the treaty ports and the provincial centres of western learning, the elaborate ceremonialism which distinguishes every phase of social life in China remains practically unaffected by the promulgation of the law (Aug., 1912) intended to replace the etiquette and salutations of the old régime by the European custom of bowing and shaking hands. The reforms contained in the republican and socialistic programme of the Kuo Min-Tang and other political societies (including compulsory education, obligatory military service, equality of the sexes, etc.) became matters of frequent discussion in the vernacular press after 1912, and produced certain effects—notably a movement for the emancipation of women—amongst the westernized element of the younger generation. As the number and circulation of Chinese newspapers penetrated farther and farther into the interior, an increasing number of the literate minority of the nation became familiar with these ideas, but they still contained no practical meaning for the masses. Similarly, by the Criminal Code, promulgated in March 1912 and revised in 1918, torture was abolished, the prison system reformed, and trial by jury introduced, together with many other reforms based on the modern and humane legislation; but the Code remains generally a dead letter in so far as the general administration of justice is concerned. After the death of Yuan Shih-k’ai, the republicanism of political parties was preserved independent of the central Government’s authority; each within his own satrapy administered public affairs and justice as he thought fit, and since then the framing of national laws has been of little interest or benefit except to the law makers.

Authorities.—A. S. Roe, Chance and Change in China (1920); Paul S. Reinsch, Intellectual and Political Currents in the Far East at the Beginning of the Century (1921); A. H. Hodges, China in the Thirty Years’ War (1920); R. F. Johnston, Buddhist China (1913); Y. K. Leong and L. K. Tao, Village and Town Life in China (1915); Timothy Richard, Forty-five Years in China (1916); E. H. Wilson, A Year of Insect in Western China (1913).

Political History, 1910–21.—Only that chronicle is agreed in dating the revolution of 1911 from the outbreak which took place at Hankow in Oct., after the accidental explosion of a bomb and the arrest of a number of anti-dynastic plotters, but the country had undoubtedly contained all the materials for an upheaval since the death of the Empress Dowager in 1908. The causes of the revolution and of the disorganization of government which subsequently prevailed, were, like those of former rebellions, originally social and economic, ascribable chiefly to the disintegrating influence of “western learning” on the one hand, and, on the other, to the increasing burdens imposed upon the nation by foreign loans and indemnities. If the semi-westerner officials, politicians and students who came rapidly to the front after the initial successes of the rising at Hankow, were able to bring about the downfall of the Manchu dynasty and the establishment of a republic almost without a struggle, it was not because they represented any conscious objection to the monarchical form of government on the part of the masses, but because they constituted at the moment practically the only organized body of educated opinion in the country and were inspired by definite aims and ambitions. Dr. Sun Yat-sen and other active leaders of the revolutionary movement had for some years been contriving to bring about a schism by工艺 measures, and southern provinces, and popular resentment against the Manchus had gradually increased, partly because the dynasty had become identified in the public mind with floods and famines, and partly because of the Government’s failure to prevent, and even to resist, the aggressions and encroachments of foreign Powers. The Cantonese leaders and agents of the revolutionary movement stirred up the people, and especially the soldiery, to vague fears and discontent by disseminating the idea that the Manchus were in league with foreigners to partition and disarm China. The agitation which they contrived to produce in the name of “sovereign rights,” against the Government’s negotiations for railway loans from abroad, led to the formation of numerous patriotic associations (chiefly at the treaty ports) which displayed great activity in the press and in the National Assembly. The signing of the Hukang railway loan agreement at Peking (April 5, 1911), in the face of strong opposition from the local gentry and literati of Szechuen, was skillfully turned to the purposes of the revolutionaries; rioting took place at Chengtu in July, to the cry of “sovereign rights” and by Sept. the province was in open rebellion. The opponents of the Government found further the ready_texts (1920); in the aggressive (1920) was manifested in Manchuria and Mongolia by Russia and Japan, and in Great Britain’s occupation of the disputed Pienma
district on the Yünnan border. The situation was such, in fact, that, failing a strong ruler at Peking, an upheaval had become inevitable, and its occurrence simply a matter of time and opportunity. The Manchus, seeking some means to avert the impending crisis, tried several methods of concession, intended to placate Young China. In Nov. 1910, they had yielded to the demand of the National Assembly and promised the convening of the promised parliament for 1913; six months later, the Regent had agreed to replace the Grand Council by a responsible Cabinet. The Imperial Clan was divided against itself at this critical juncture by a struggle for supreme power between the Regent and the Dowager Empress Lung Yu, widow of H. M. Kuang Hsi; divided also, because several of its leading members, under the influence of Prince T'ai T'an, by Sun Yat-sen and provincial revolutionaries, were in favour of a policy of constitutional reform. But even had it presented a united front, the forces which brought about the abdication of the dynasty were beyond its strength.

When, immediately after the outbreak at Hankow, the mutineers captured the Wuchang mint and the arsenal at Hanyang, it soon became apparent that the Regent possessed no resources either of strength or of statecraft. Seriously alarmed by the rapid spread of the rebellion, he was persuaded to call to his aid the famous Chinese viceroy, Yuan Shih-k'ai, whom he had disgraced and dismissed from office in 1906. On the accession of his son T'ai Hsüan, Oct. 14 1911, Yuan was recalled from his retirement and appointed viceroy of Hunan and Hupeh, with supreme command of the Imperial forces. From this date until his death (June 1916), the direction of affairs at Peking lay in his hands.

Yuan Shih-k'ai's military operations on behalf of the monarchy were half-hearted at best and require but little comment. He took the field towards the end of Oct., but returned to Peking on Nov. 13, having been elected prime minister on the 8th. At the end of Nov., after desultory fighting, the position of the rebels in and around Hankow had become untenable. But by this time the cedars of the princes of the imperial family, which had combined with the helplessness of the Manchus, had borne fruit.

Fourteen provinces—or rather their officials—had declared for the revolutionaries and against the monarchy, whilst the attitude of influential mandarins like Tang Shao-yi and Wu Ting-fang, who had risen to eminence under the Empress Dowager, was indicative of the fact that the movement was not likely to be suppressed by military force. Nanking held out for the Imperialist cause until the beginning of Dec., at which date Yuan Shih-k'ai agreed to an armistice, for the purpose of discussing the wisdom of withdrawing from the revolution and dividing the provinces. After his recall to power, Yuan had done his utmost to stem the tide of disaffection and to preserve the monarchy, shorn of its privileges, as the centre of a reformed constitutional system. He had consistently resisted the demands of the radical extremists, and when, as the result of the increasing demoralization of the court and the sympathetic attitude of the foreign press towards the revolution, Sun Yat-sen's party began seriously to proclaim their intention to establish a republic, he did everything in his power to prevent it. He publicly declared his belief that the overthrow of the throne must mean chaos "amidst which all interests would suffer, and there would be no peace in the empire for several decades." When finally he consented to parley with the revolutionary leaders, he was fighting practically single-handed for the principles in which he believed. The National Assembly, which had adhered to the constitutional programme, had been denounced and superseded by the Kuo Min-tang's Republican Committee at Shanghai, early in November. The British Government and others, which had warmly advocated his recall to office at the beginning of the rebellion, had failed at the critical moment to give him the moral and financial support which he had every reason to expect, and it was evident that without a large foreign loan, his position was hopeless; the Regent had abdicated (Dec. 6) and Tang Shao-yi, the ablest of his lieutenants, had frankly declared his sympathies with the Cantonese republican party.

The armistice negotiations commenced at Hankow on Dec. 11, with Tang Shao-yi acting as Imperial delegate. On the 18th they were transferred to Shanghai upon the demand of the Republican Committee. The result was a foregone conclusion; before the end of the month, the Manchu court had agreed to submit to a National Convention the question of monarchy or republic. On Dec. 23, Dr. Sun Yat-sen, who had been in England when the revolution began, arrived at Shanghai; a week later, a council of provincial delegates at Nanking elected him to be first President of the Chinese Republic, and on Jan. 1 1912 he took the oath of office. On the 12th, the court being terrified by bomb outrages at the capital, the Emperor's abdication was proclaimed in an edict which transferred the government to the people's representatives and declared that the constitution should henceforth be republican. By the same edict, Yuan Shih-k'ai was confirmed in powers to organize and placate the rebellious provinces. On Feb. 14, Dr. Sun Yat-sen resigned the presidency in favour of Yuan Shih-k'ai, who was elected provisional President by the Nanking Council and took the oath of office at Peking on March 10. Li Yuan-hung was elected vice-president and a provisional constitution was adopted by the Nanking delegates. On April 2, the Government of the republic was transferred from Nanking to Peking. A new provisional council was formed consisting of five members from each province, elected by the provincial assemblies, five members each from Inner and Outer Mongolia, and one member from Korea. On Apr. 24, it was reported that Shih-k'ai had placed 100,000 troops in the capital, and on April 26, he was proclaimed "the provisional President of the republic of the Chinese people." On May 1, he declared himself President of the republic, and on May 5, with the consent of the Provisional Parliament, he appointed a cabinet, and gave his assent to a constitution.

Yuan Shih-k'ai's position as President of the republic was one of great difficulty and danger. He had never been at pains to conceal his dislike for the political ideas of the Cantonese party, or his conviction that the monarchical form of government was best suited to the needs of the Chinese people; in the eyes of the Kuo Min-tang Radicals, he was therefore suspect from the outset. If they professed to believe in his conversion to Republicanism, it was because his was the only name likely to inspire the masses with respect for the new régime, and also because they expected him to play the part assigned to him with due respect for the rights of the states and the peoples of the empire. In the eyes of the army and the Revolutionists, the Kuo Min-tang Radicals were still powerful enough to compel him to adopt a policy of watchful waiting and to concentrate his attention upon ways and means for raising money abroad. So long as his treasury remained unreplenished, his position necessarily lacked the prestige which the financial support of the Powers conferred, and he had no means of securing the support of the military chieftains, whose troops were usually at the service of the highest bidder. It was not until April 25 1913 that, after prolonged negotiations with the Six-Power group of financiers, Yuan's Minister of Finance succeeded in concluding the "Reorganization" loan, which placed him in possession of the interest of war to the amount of about 10 millions sterling. His financial position and the moral support of the foreign Powers thus secured, Yuan proceeded to show his hand and to defy the Kuo Min-tang. The latter had secured a powerful majority at the elections held in the beginning of the year. They came to Peking for the opening of Parliament (April 7) in a belligerent mood, greatly exasperated by the assassination of Shanghai of one of their ablest leaders, Sung Chiao-jen, the speaker-elect, whose death was undoubtedly planned and carried out by the President's orders. Assembled under these conditions, the life of the new Parliament was not destined to be a long one; its career, indeed, began and ended with the election of speakers for both Houses. Yuan Shih-k'ai refused to recognize their claim to supervise and sanction his loan negotiations and ordered the conclusion of the agreement with the foreign banks in spite of the agitated protests of the Radical leaders. Realizing the danger of their position many
of these now fled from Peking, and in the central and southern provinces "a war to punish Yuan" was begun. It lasted only two months and ended in a complete rout of the disorganized forces led by Generals Li Lieh-chun and Huang Hsing. Yuan was now firmly in the saddle.

After thus forcibly asserting his authority, Yuan proceeded to vindicate and consolidate it. In the first place, by the lavish use of money and the display of military force, he succeeded in securing his election as President for a term of five years—his title having hitherto been provisional. On Oct. 10 1913 he took the oath of office, with much pomp and circumstance, in the throne room of the Winter Palace; and availed himself of the occasion to declare that, for the future, he intended to rule without interference and in accordance with ancient tradition. Four weeks later, a presidential mandate, endorsed by his docile Cabinet, ordered the unseating of all the Kuo Min-tang members of Parliament, on the ground of their treasonable conspiracies. As half of the Senate and more than half of the House of Representatives were thus disposed of, no parliamentary quorum was left. All obstacles to the exercise of Yuan's autocratic authority were thus removed. He continued for a while to profess respect for the decisions of constituent bodies, but his loyalty to the republic, if it speedily became apparent that the ideas which inspired his policy were those which he had frankly proclaimed during the crisis of the revolution.

The Parliament at Peking was replaced by a political council and "an administrative conference for the revision of the constitution," composed almost exclusively of officials and literati of the old school, selected by the President or by his agents and representatives in the provinces. The provincial assemblies were dissolved, on the carefully directed recommendation of the military governors, "for perversely usurping financial authority and obstructing the business of administration." By the beginning of 1914, it was evident that Yuan intended to restore the old orthodox autocracy and centralization of power in the politico-administrative administration; it was also evident that, so far as the great mass of the people was concerned, his policy evoked little or no opposition and that, so far, he was justified in his declared belief that they were "no lovers of changes that ran counter to immemorial custom."

When, upon the advice of his administrative council, the President Dietarnt announced his intention of performing the Winter Solstice ceremony at the Temple of Heaven and restoring the official worship of Confucius, he proclaimed himself to that nation as an autocratic ruler and gave the first indication of his own imperial ambitions. There is reason for believing that these ambitions had no place in his mind when, in 1911, he strove to uphold the Manchu dynasty, but that they gradually and insidiously asserted themselves, partly as the result of the exercise of despotic authority and partly by reason of the death of the boy Emperor's guardian, the Empress Dowager Lung Yu (Feb. 1914). Even when his intentions had become unmistakably clear, he fully realized the dangers which confront the creation of a new imperial line under a political system in which the divine right of rulers is intimately bound up with the sacred institution of ancestor worship; but he took his risks and carried his principles to a conclusion for which there were precedents in history and justification in the situation itself. Had the question of his claim to the throne been decided simply as a matter of internal politics, he could probably have succeeded in establishing and extending his effective authority with the general consent of the nation, wary of civil strife and disorder. But Japan's assertion of her "special rights" and material interests in China, greatly increased after the outbreak of the World War and the expulsion of the Germans from Kiaochow, plainly indicated that Yuan Shih-k'ai would not have a free hand in the matter. His inability to discern the serious danger of intervention from this quarter was the weakest point in his armour; indeed, his failure to grasp the international situation afforded a remarkable contrast to the perspicacity he displayed in dealing with his own countrymen.

Within a year of the outbreak of the World War, the movement for the restoration of the throne in China had assumed definite form and direction. The Chou-An-hui society, composed chiefly of Yuan's supporters, organized an energetic monarchical propaganda at Peking and in the provinces, but they, like the President, failed to draw from the "21 Demands" (which Japan had forced upon the Chinese Government in May 1915) the obvious conclusion that the Japanese Government would strongly oppose Yuan's plans in the event of his advancing serious claims to the throne. During the negotiations which took place between Jan., when the "21 Demands" were first presented, and May, when they were imposed by an ultimatum, the President's attitude towards the Japanese was evidently conciliatory, but it failed to reveal application of the truth that since the days of his residency in Korea he had never been persona grata in Japan, and that the Government at Tokyo would therefore do its utmost to prevent his assumption of autocratic power. One of the ablest and most influential scholars in China, the famous political writer, Liang Ch'i-ch'ao, who had strongly supported Yuan's fight for the preservation of the monarchy in 1911, stood forward boldly in Aug. 1915, to denounce the Chou An-hui's propaganda and to warn the President of the perils which threatened the course upon which he was embarking. Resigning his position on the Elite Council, Liang proceeded to publish his opinions in the Peking Gazette, opposing Yuan's accession to the throne, partly on grounds of classical orthodoxy and partly because he perceived the inevitability of Japanese intervention. Yuan, well aware of the far-reaching influence of Liang's views, did all in his power to win his support. Failing in this, he made a pretence of constitutional procedure by referring the question of the monarchy to a vote of the provinces, or rather, to the vote of a number of individuals appointed by himself to represent them. The result, a foregone conclusion, was a practically unanimous vote (Nov. 5) in favour of Yuan's accession.

But Liang Ch'i-ch'ao's wisdom was rapidly justified. On Oct. 30, the Japanese minister, supported by his British and Russian colleagues, convened the President, through his Foreign Office, friendly "advice" to the effect that the Japanese Government deprecated the idea of his restoring the monarchy in his own person, on the ground that the change would lead to serious internal dissensions. Yuan's reply was dignified but short-sighted; he informed the Japanese minister that his Government was quite capable of preventing disorder in China, and that he looked to the Governments of friendly Powers to control the activities of Chinese revolutionaries within their territories. On Nov. 9, the Chinese Government, in announcing the result of the "monarchical "vote," intimatd that no change would take place before the New Year; but this decision was rescinded, and matters hastened by an abortive insurrectionary movement which occurred at Shanghai on Dec. 6. The State Council thereupon memorialized the President to put an end to the prevalent uncertainty and unrest by proclaiming himself Emperor without further delay. On the 12th the monarchy was proclaimed, and the announcement was made that the inauguration ceremony would take place on Feb. 6.

It was not to be. Within a week of the proclamation of the monarchy, a rebel broke out in the far-western province of Yunnan, led by Tsai Ao, a military official educated in Japan. On Dec. 29 the province, through its officials and local gentry, declared its independence in opposition to the monarchy. Thereafter, in spite of initial successes gained by the Government's forces, the insurrection spread with a rapidity which justified the foresight of Liang Ch'i-ch'ao and emphasized the fact that, as matters stood, Yuan Shih-k'ai had not achieved either the personal prestige or the pecuniary resources sufficient to command for his authority as Emperor the respect and loyalty of the semi-independent chieftains of the provinces. By the end of Jan. Kuangsi and Kweichow had renounced their allegiance and other provinces were wavering. His star was so rapidly declining that his advisers persuaded him to issue an official announcement (Jan. 22) postponing indefinitely the establishment of the monarchy, in view of the country's internal dissensions. Having thus confessed to failure, when within sight of the summit of his ambitions, Yuan's fate as a ruler was sealed. By the end of
March his opponents had become so many and so active that his remaining friends advised him to resign the presidency and retire into private life. A month later he had been denounced as a usurper in nearly every province by the very men who had "elected" him to the throne in Nov., and even at Peking there were but few to do him reverence. Nevertheless he declined to resign the presidency, and attempted a compromise by issuing a mandate (April 22), which transferred all civil authority to a reorganized Cabinet under the premiership of Tuan Chi-jui, an able and ambitious official, who had first achieved distinction, as Yuan's Minister of War, by suppressing Sun Yat-sen's revolution in 1913. In order to placate the Cantonese and other disaffected elements in the South, the President announced his intention of reintroducing parliamentary government, without delay. But the Kuo Min-tang Radical leaders were not disposed to come to terms with Peking; the absence of any effective authority at the capital merely served to stimulate new ambitions and create new causes of conflict amongst the political factions. The Kuo Min-tang, repudiating Yuan Shih-k'ai, therefore proclaimed the establishment of a new provisional Government at Canton and elected the Vice-President Li Yuan-hung to the presidency. Peking was now confronted with a renewal of civil war and by a situation which Yuan's persistence in retaining office rendered peculiarly difficult. But at this juncture Yuan died, worn out by an illness which long before had aggravated, and Li Yuan-hung duly succeeded to the presidency.

It soon became apparent that with Yuan Shih-k'ai had passed the only hope of restoring a strong central Government in China. Had he lived and succeeded in restoring law and order, he might also have succeeded in turning to his country's permanent advantage the favourable economic situation in which the European War had placed it. But with his death the affairs of the nation became once more involved in a chaotic confusion of personal ambitions and political rivalries, and the functions of Government were rapidly transferred from the civil to the military organization. At the date of Yuan's death, the fiscal relations between Peking and the provinces which he had begun to reorganize in 1914, had completely collapsed, as the result of the new insurrectionary movement; the central Government was confronted by an empty treasury and without means of replenishing it, other than foreign loans. The Government banks at Peking had suspended specie payments in May 1916 and the military governors of the northern provinces, on whose support the administration depended, were loudly clamouring for money wherewith to pacify their unpaid troops. Yuan Chi-jui, as premier of the new Cabinet, endeavoured to disarm the opposition of the Southerners and to secure support for the new Government by the revolutionaries. By convening the Parliament which Yuan had broken up in 1913, to meet at the capital on Aug. 1. At the same time he sought to win over the most influential of the Cantonese leaders, Tang Shao-yi (prominent before the revolution as a metropolitan official and protégé of Yuan Shih-k'ai), by offering him the Ministry for Foreign Affairs. But Tang Shao-yi and his colleagues of the Canton provisional Government showed no desire for unity; on the contrary, denouncing the Peking administration as "militarists" and monarchists in disguise, they professed to insist upon the immediate restoration of the provisional Government set up and adopted by the revolutionaries in 1911 at Nanking. Subsequent events proved clearly that no devotion to any political principle lay behind their actions, and that the central Government could never have disarmed their opposition by granting the Nanking, or any other, constitution. The nation was doomed to civil strife by reason of rivalries that were, and still are, personal and predatory, and which only lawfully constituted authority, backed by disciplined forces, could ever overcome. At the opening of Parliament on Aug. 1, two facts were speedily made manifest: firstly, that the Kuo Min-tang's repudiation of Peking's authority had not been inspired solely by Yuan Shih-k'ai's attempt to restore the monarchy and would not end with it; secondly, that the existence and proceedings of Parliament, no matter under what constitution convened, were completely at the mercy of the military governors. One of the first steps taken by Gen. Li Yuan-hung, as President of the republic, was to call a meeting of generals and to inform them that the country's destinies lay in their hands. Thenceforward the northern military governors, led by the premier Tuan Chi-jui, became the dominant factor of the situation. At the outset they were frankly opposed to the revival of the Nanking constitution and to the reassembling of the Parliament of 1913; while the navy, with its headquarters at Shanghai, was equally decided in its refusal to acknowledge the authority of Peking until Parliament had resumed its functions. Finally, a compromise was reached by the formation of a new Cabinet wherein the South was represented. Parliament, in which the Kuo Min-tang party predominated, declared its intention of adhering to the Nanking provisional constitution, pending the completion of a new and permanent instrument, for the preparation of which a special drafting committee was appointed. But it was not long before the military governors made it plain that, while they might permit the parliamentarians to debate their theories of government, its practice would continue to be determined by their own necessities, and that the chief problem with which the Cabinet would henceforth have to grapple, lay in the provision of funds for the maintenance of their uncontrolled and uncontrollable armies. After the passing of Yuan Shih-k'ai the history of the Chinese Government became a series of expedients and experiments intended to provide a temporary solution of this problem, all of which tended to aggravate its difficulty.

At the time of his "election" to the throne, in Nov. 1915, Yuan Shih-k'ai had made certain tentative overtures through the legations at Peking, with a view to China's abandonment of neutrality and her espousal of the cause of the Allies. By the adoption of this course he hoped not only to obtain the financial relief which he required, but to make provision for assistance in the future against the policy of encroachment displayed by Japan in the "21 Demands." But he was compelled to abandon negotiations to this end, because of the troubles that began to press upon him and because of the Japanese Government's unexpressed opposition to the proposal. After his death, however, the chief reason for this opposition was removed and in the winter of 1916, the question of China's joining the Allies came to be seriously considered by Tuan Chi-jui's Cabinet. The premier and most of his colleagues were anxious to take this step, because it offered an opportunity of suspending the Boxer indemnity payments and of securing Chinese representation at the Peace Conference at the close of the war. But amongst the other officials, there were some (including the President) who, greatly influenced by the activities of German agents and their lavish propaganda, desired to adopt a policy of passive neutrality. Opinion was thus divided and before the question was finally settled (March 11) by a decisive vote of both Houses of Parliament, it had become inextricably involved in the dissensions and intrigues of the rival political factions at the capital, and had led to an open breach between the Premier and the President. On Feb. 4 the U.S. minister at Peking invited the Chinese Government to follow the example of the United States by formally protesting against Germany's submarine campaign and by severing diplomatic relations; on the 9th, the Chinese Foreign Office conveyed an intimation to the German minister in the sense required. The U.S. was the only Power who formally gave notice, but their policy was opposed and denounced by the German-subsidized section of the press and by the President's party in Parliament, advocating cautious delay. On Feb. 28, the Allied ministers at Peking, by a joint memorandum, notified the Chinese Government that if diplomatic relations with Germany were severed, the Powers would suspend the Boxer indemnity payments and consent to a revision of the Chinese customs tariff. The premier, after consulting his supporters at Peking and in the provinces, decided to act upon this advice and to instruct the provincial authorities accordingly. The President's refusal to confirm these instructions led to a crisis; eventually, after the premier had tendered his resignation, the President gave way. Tuan Chi-jui's policy having been endorsed by Parliament, relations with Germany were severed on March 14 1917; on the
same day the German ships at Shanghai and Amoy were seized by the Chinese authorities, and on the 25th the German minister and his staff left Peking.

The premier and his supporters were now anxious to carry their policy to its logical conclusion and to secure the benefits of complete identification with the cause of the Allies, by declaring war against the Central Powers. A conference of military governors convened by the premier at Peking on April 26 voted decisively for war; a few days later the Cabinet adopted a unanimous resolution to the same effect. But once again the national aspect of the question became submerged in a welter of factional intrigues. The President's party, consisting of a number of Kuo Min-tang parliamentarians, who professed to see in the attitude of the military governors a menace to parliamentary government, and of others alarmed by the increasing rumours of secret agreements between Tuan Chi-jui's party and the Japanese Government, constituted an opposition sufficient to prevent the Cabinet from carrying its resolution into effect. Among the literati and disinterested patriotic men there undoubtedly existed a genuine difference of opinion as to the advisability of committing the nation definitely to a policy of hostility to Germany, a difference which was reflected in the conflicting advice publicly given by scholars like Liang Ch'ieh-ao and Kang Yu-wei. But so far as Parliament was concerned, the question resolved itself into a sordid struggle for power between Tuan Chi-jui, backed by the northern Tuchuns, and his political opponents. At a secret session of the Lower House of Parliament on May 10, it was apparent that the question of war with Germany had become subordinate to that of a combined attack upon Tuan Chi-jui. On May 19 a resolution was adopted to the effect that the House would decline further to consider the question until the Cabinet had been reconstructed. As Tuan's colleagues with one exception had resigned at the first sign of serious trouble, the resolution amounted to a demand for the premier's resignation. Tuan, however, availed himself of this ground of appeal to the Kuo Min-tang move by a communication from the military governors to the President demanding the immediate dissolution of Parliament, and by the announcement of their intention not to leave the capital until this had been done. Thus challenged, the President issued a mandate (May 23) dismissing the premier and appointing the septuagenarian Wu Ting-fang in his place. Tuan, following the course usual on such occasions, fled from the capital and, taking refuge with the military party's leaders at Tientsin, announced his intention of defying the President's authority. The military governors of several provinces north of the Yangtsze thereupon proceeded to declare their independence of the central Government whilst the Kuo Min-tang leaders, hurriedly leaving the capital for the South, announced their intention of taking up arms in defence of Parliament and the people's liberties. It is typical of the chaotic condition of Chinese affairs that at this juncture Gen. Feng Kuo-chang, the Vice-President, while tendering his resignation, announced that the lower Yangtsze region would remain "neutral."

The struggle thus began lasted for three months and postponed China's declaration of war against Germany until the middle of August. As it proceeded, it became more and more apparent that the contending factions were not really concerned with any question of political principles, but fighting only for place and power. At the beginning of June, the military governors established a "Provisional Government" of their own at Tientsin with the aged ex-viceroy, Hsi Shih-chang (later President of the republic), cast for the dummy rôle of president-director. At the same time they warned Li Yuan-hung that if he desired to remain President, he must submit to their wishes and dissolve Parliament; to enforce their demands they proceeded to mass troops in the vicinity of the capital. Li Yuan-hung sought to gain time by summoning to his aid as "mediator" Gen. Chang Hsin, the famous swashbuckler chieftain of Shantung fame. Gen. Chang promptly came north with a "bodyguard" of several thousand troops, and arrived at Peking on June 12; but the value of his mediation was discounted in advance by the announcement that he would insist upon the dismissal of Parliament, and of all rumours of his intention to restore the Manchu dynasty. On June 13 Li Yuan-hung yielded, and Parliament was dissolved by presidential mandate.

The question of joining with the Allies against Germany was now relegated by common consent to the background and all attention concentrated on the struggle of personal ambitions at Peking. Tuan Chi-jui, with his Tuchun supporters, was still in watchful waiting at Tientsin. Parliament had elected a new Premier (Li Ching-hsi), but the attitude of the military party made it an uncomfortable post to fill and he had cautiously declined to assume office. Many of the Kuo Min-tang politicians had fled to Shanghai and Canton and, with the support of the army, were once more preparing to take the field against Peking. Under these conditions the danger of internal dissensions on a wide scale without definite purpose was unmistakably more serious than at any time since the overthrow of the Manchus. Regarding the matter in this light, the United States addressed a note to the Chinese Government (June 6) deploring the prospect of civil war and intimating that the restoration of national unity was a matter of more immediate importance to China than the declaration of war against the Central Powers. This advice, though morally sound, was politically unfortunate, inasmuch as it was construed and proclaimed by the Kuo Min-tang as the indirect recognition of the Chinese claim to mediate for the alliance of the United States to the policy of Tuan Chi-jui and his military supporters; it therefore resulted in stiffening Young China and the Cantonese Radicals in their uncompromising hostility to the central Government. It was common knowledge that Tuan Chi-jui had framed and pursued his policy in close touch with Japan, and that he relied upon that country for financial support; it was only natural therefore that Young China should look to the United States not only to deliver them from the militarist and monarchist party, but to protect the Chinese republic from Japan.

General Chang Hsin, as the central figure on the Peking stage, had been actively at work and counselled a coup de main, and proposed to bring about a reconciliation between President and premier. His proceedings were so obviously inspired by his own overweening ambitions that it was not long before signs of dissension manifested themselves between him and his colleagues of the military party. When his policy became fully revealed by a coup de main (July 1) which withdrew the young Emperor from his retirement and proclaimed the restoration of the Dragon Throne, the chief cause of the opposition which his action promptly evoked from Tuan Chi-jui and the Peking military chiefs lay in the fact that he proposed to install himself as the virtual viceroy of Chihli. Few, if any, of those who now denounced Chang Hsin as a traitor to the republic and took the field against him, were in reality opposed to the monarchy (most of them were, in fact, solemnly pledged to support the restoration); but they could not brook the assumption of supreme authority by one who had stolen a march upon them and taken advantage of their divided counsels. Tuan Chi-jui, in particular, was known to be in favour of the monarchy, but only on condition that he himself became viceroy of Chihli and the power behind the throne. Emerging therefore from his retirement at Tientsin, he led his army to the capital to defend the republic. After a few days of discreditable and half-hearted fighting, Chang Hsin capitulated (July 12) and the young Emperor was consigned once more, with all due respect, to the tranquil dignity of his court without a kingdom. Chang Hsin's troops were permitted to retire, with the honours of war and three months' pay; their leader, who had found a temporary refuge in the Dutch legation, was left un molested.

In "vindicating the Republic," Gen. Tuan had received the active support of the Vice-President, Gen. Feng Kuo-chang, commanding the army at Nanking. After the capitulation of Chang Hsin, Tuan resumed the premiership, with powers that were practically those of a dictator, so that the position of Li Yuan-hung as President became impossible. From the Japanese legation, whither he had fled for safety upon the proclamation of the monarchy, he announced his intention of retiring into private life. On July 18 he was succeeded in the presidency by
Feng Kuo-chang, who declared his readiness to endorse the policy of the premier in the matter of declaring war against the Central Powers. The agreement thus reached gave promise of a united administration and a clear-cut policy at Peking; nevertheless, it failed to reconcile the disaffected elements represented by the Kuo Min-tang. These declared the new Government to be illegally constituted and demanded the immediate convocation of Parliament; failing which (as a proclamation by Sun Yat-sen announced) it would meet, under a provisional Government, at Canton. Undeterred by this opposition, the premier, after receiving certain assurances from the Allied ministers, notified them that China would declare war against Germany so soon as the new President had assumed office. Feng Kuo-chang arrived at Peking on Aug. 15; two days later, the Cabinet adopted a unanimous resolution in favour of the declaration of war, which was formally issued on Aug. 14.

The criticism focused on Kiu Kia-kiu and the impossibility of predicting the future policy of that country, made it difficult for the Allied Governments to come to a common understanding in regard to the financial and other advantages to be conceded to China upon abandoning her neutrality. It was eventually agreed to suspend the Boxer indemnity payments and to authorize an increase in the Maritime Customs tariff; and at the same time the Government’s immediate necessities were relieved by a loan of 100 million yen from the Consortium banks.

With its foreign debt obligations thus diminished and its revenue permanently increased by the Kielord Done’s highly successful reorganization of the salt gabelle, the Chinese Government had an opportunity of regaining financial and political equilibrium such as had not occurred since the beginning of the century. Had Tuan Chi-jiu seized the opportunity by offering to the southern leaders representation in the Cabinet and a fair share of the sweets of office, harmony might possibly have been restored; but he refused to do so and his new Cabinet (July 17) contained only representatives of the military party and the Chin Pu-tang. The result was a rapid development of a new separatist movement in the South, which had begun in June, after the dissolving of Parliament, by the secession of Kwangtung. Henceforward, during the period with which we are dealing, the history of China becomes an increasingly hopeless tangle of faction feuds. Almost before the new President had assumed office at the capital, his adherents (the Chihli group of the Peiyang party) were in conflict with the premier concerning the policy to be adopted in dealing with the South; Tuan Chi-jiu being all for strong measures, and Feng Kuo-chang for conciliation. As the result of these differences, Tuan Chi-jiu once more resigned; but again his friends, the military governors, intervened and proclaimed their intention of carrying on the war against the South, without the aid of the Cabinet. Eventually, Gen. Chang Tso-lin, the Tuchun autocrat of Manchuria, put an end to all further peace talk by moving a large body of troops into Chihli; Tuan Chi-jiu thereupon resumed the premiership and, with the support of the northern Tuchuns, took up the offensive against the southern provinces.

Having “vindicated the Republic,” it was necessary for Tuan Chi-jiu to maintain the appearance of constitutionalism. He therefore convened an assembly, which proceeded to revise the law for parliamentary elections. This having been duly promulgated (Feb. 7 1918), a new Parliament (considerably reduced in numbers) was elected, in time to deal with the quinquennial election of the president.

On Sept. 4 the presidential election took place, but the matter had been decided in advance by the military Tuchuns, assembled in conference at Tientsin. Feng Kuo-chang was passed over, because of his inability to work with Tuan Chi-jiu, and in his place was elected Hsi Tshih-chang (in 1921 President of the republic), a veteran official who had achieved a reputation for justice as viceroy of Manchuria and guardian of the heir-apparent under the monarchy.

The Chinese guilds and chambers of commerce at the treaty ports, a strong movement had begun to manifest itself on the one hand against the continuance of civil war, and on the other against the subservience and venality of the Peiyang politicians in their dealings with Japanese agents. This attitude of the business community was endorsed and the country’s urgent need of peace emphasized, by earnest representations addressed to the Chinese Government by the Allied Ministers at Peking. The new President was well aware of the danger of China’s internal and international position; by temperament and training inclined to methods of conciliation, he did all in his power to restore peace and goodwill between the Peiyang party and the Cantonese leaders of the South. On Nov. 16 he issued a presidential mandate, calling upon the commanders of the northern forces to suspend hostilities and to keep within their own lines. This armistice was followed by negotiations for a conference (eventually convened at Shanghai) with a view to removing the alleged grievances of the southern Constitutionalists and finding means to amalgamate the rival parliaments under a coalition Government. The President’s action was undoubtedly influenced, and the peace movement strengthened, by the Allies’ victorious conclusion of the war; for a little while it seemed as if the Shanghai conference might lead to some definite and satisfactory conclusion, but in the end it merely served to demonstrate the fact that neither party had any sincere desire to put an end to the civil strife, from which not only the northern Tuchuns but the southern parliamentarians profited.

As leader of the southern delegates at the Shanghai peace conference, Tang Shao-yi demanded the cancellation of the indemnity payments and said that a new conference with Japan, the sum total of the War Participation Bureau, and a pledge that the Peking authorities would accept no further financial assistance from Japan. Most of the eight demands which he laid before the northern delegates (May 1919) evoked but little public interest, but the increasing evidence of Japanese political and financial ascendancy at Peking produced a strong manifestation of opinion by Young China in support of the southern party’s attitude, which was greatly increased by the decision of the Versailles Conference in regard to the Shantung question. The Sino-Japanese military agreement (March 1918 was the most important of several secret agreements concluded by Tuan Chi-jiu’s Cabinet. It was ostensibly intended to provide for united action by China and Japan against German and Bolshevik activities in Siberia, and especially for the protection of the Siberian railway; but, according to the leaders of the southern party, it not only gave Japan a steadily expanding control over China’s military forces in the North, but it virtually re-established many of the “protectorate” conditions which had been imposed (and subsequently withdrawn as the result of representations by the Powers) under Group V. of the “21 Demands” of May 1915. So strong was the feeling produced by the student strike, the suppression of the news, and other manifestations at home at the increasing evidence of Japanese ascendancy at Peking, that the Chinese Government was compelled to instruct its representatives at Versailles not to sign the Peace Treaty; and two of the members of Tuan Chi-jiu’s Cabinet, who were most prominently identified with the Government’s financial dealings with Japan, were compelled to resign. The attitude of the southern party remained, however, irreconcilable, and the renewed discussions of the Shanghai peace conference were fruitless; indeed, a fresh cause of offence was proclaimed by the southern delegates in the fact that the military agreement, which should have automatically ended at the same time as the Allied Intervention in Siberia, remained in force by virtue of a new pact, said to have been secretly concluded at Peking in March 1919.

Since the death of Yuin Shih-k’ai, the position of the group of politicians in control of the Government at Peking had become entirely a question of funds, in the sense that Tuan Chi-jiu and his supporters were continually confronted by the alternative of either retiring into private life or of raising money sufficient to retain the support of the northern military governors. It was a position which never offered any prospect of stability or permanence; no Government could hope to maintain itself in power, if once its borrowing capacities were exhausted. In the summer of 1920 the inevitable happened. Denounced by Young
China, attacked on all sides for having sacrificed the nation's sovereign rights, and abandoned by many of their dearly bought supporters. Tuan Chi-jui and his colleagues of the Anfu Club were forcibly driven from power. The control of the Government passed then from their hands into those of the Chihli faction, headed by the President and the two powerful Tuchuns, Chang Tsao-lin and Tsao Kun. This defeat and expulsion of the premier were hailed by Young China as a victory for the constitutionalist cause and hopes were expressed that the popular Gen. Wu Pei-fu, whose troops from the Yangtze had played a decisive part in the struggle, might be able to carry out his plans for a citizen government and thus unite the rival parliaments. But these hopes were short-lived. Gen. Wu Pei-fu and the national convention were very speedily relegated to the background, while the struggle for place in power was taken up by the old lines between new groups of rival politicians. The immediate result of the upheaval was to diminish the authority of a few of the lesser military governors and to increase that of the great provincial chieftains; but the latter showed no disposition to sink their individual ambitions in any common purpose of patriotism. The financial difficulties of the Government were seriously increased by the heavy claims advanced by the military leaders of the victorious Chihli party for payment of their troops, and it was not long before the native press began to denounce both the President and Chang Tsao-lin as being even more dangerously subject to Japanese influence than the Anfu Club. The capture of the capital by the army during the Revolution, a fact which had been manifested in Sept. 1912 by a matrimonial alliance concluded between the families of Chang Tsao-lin and Tsao Kun, the two most powerful Tuchuns of the North; at the same time, there were signs of a rapprochement between these satraps and the followers of Tuan Chi-jui, while the return to public life of Gen. Chang Hsin, under the protection of the President, gave currency to fresh rumours of a movement impending for the restoration of the throne.

At the end of 1920, the situation offered but little hope of relief for the sufferings of the Chinese people, continually harassed and plundered since the revolution by the undisciplined forces of semi-independent chieftains, whilst the general condition of the country reflected the increasing financial embarrassments of the Government. The defeat of the Anfu party and the emergence of a new group in control of the metropolitan administration, had produced no change in the situation; indeed, it was evident that no improvements could take place so long as the Government continued to exist at the mercy of the military governors and compelled therefore to satisfy their capricious at all costs. Even before the conclusion of the war in Europe, the Allied Powers had had occasion to observe the desperate measures which were being resorted to in order to raise funds, and the truth had become generally recognized, not only abroad but by the mercantile class in China, that no financial or administrative panacea could produce a stable Government at Peking, unless accompanied by firm measures, taken under foreign supervision, for the disbandment of the provincial governors' military forces. In July 1918, the U.S. Government took the initiative of proposing the formation of a new four-Power financial Consortium. To this end a conference was held at Paris in May 1919, and after protracted negotiations between the Government and financial groups concerned, an agreement was reached (Oct. 15, 1920) which provided for international cooperation between the United States, Great Britain, France and Japan in regard to the pooling of existing and future loan agreements with China. Under the scheme initiated at Washington it was proposed to make the disbandment of troops an essential condition of new loans; at the same time steps were taken to establish an international board for the abolition of 'spheres of influence' and for merging all railway concessions into a comprehensive Chinese system, financed by the Consortium, wherein the principle of effective supervision would be observed. In the spring of 1921, however, the prospect of any general disbandment of the Tuchun troops seemed as remote as ever; indeed, the forces of Chang Tsao-lin and Tsao Kun had recently been considerably increased, and the opinion was gaining ground that something more forcible than financial cooperation would be required to achieve their disbandment and to reestablish the authority of the central Government at Peking.

Bland, _Recent Events and Present Policies in China_ (1912) and _China, Japan and Korea_ (1921); Putnam Weals, _The Fight for the Republic in China_ (1918); H. M. Vinacke, _Modern Constitutional Development in China_ (1920); _The China Year Book_ (1919).

Government and Administration.—The establishment of the republic, following on the revolution of 1911, was proclaimed March 1912, and was accompanied by aousticious and official ceremonies with the past and the substitution of a democratic form of government for China's ancient system of autocracy based on parental rule. Nevertheless, the history of the country, during the first ten years of the republic, and the methods of government practised by its new rulers, afford convincing proof of the abiding strength of the autocratic principle inseparable from Confucianism, ancestor worship and the family system. Reverence for this principle was unmistakably displayed at the outset, when the republican leaders, after the abdication of the Manchus, made formal obeisance at the shrine of the first Ming emperor (Feb. 15, 1912) and ascribed their coronation in the name of his illustrious spirit. It was subsequently manifested in the "Articles of Generous Treatment," which pledged the Government of the republic to allow the Manchu emperor and his court to continue to reside in the imperial palace, with his retinue and imperial guards and a pension of 4 million taels per annum, and which made special provision for His Majesty's regular performance of the religious ceremonies at the ancestral shrines and mausolea. The administration of public affairs under the republic, whether by the "militarists" of the northern party, or the so-called constitutionalists of the South, has differed very little in essentials from that of the old regime; but new causes of unrest, conflicting much suffering upon the common people, have arisen from the elimination of the prestige and authority of the Throne. Neither the mandarins nor the masses have shown capacity to adapt themselves to democratic institutions.

In theory, the constitution under which the republic of China is governed is that which was drafted by the leaders of the revolution at Nanking in Nov. 1911 and formally promulgated in March 1912. It is admittedly a provisional constitution and has never yet possessed any effective force in determining either parliamentary or administrative procedure. Under its authority a Parliament was elected in 1913, only to be suspended in Jan. 1914, by the President Dictator, Yuan Shih-k'ai, who thereupon until his death administered the Government in accordance with the accepted traditions of paternal despotism. Following upon the death of Yuan (June 1916) all the measures which, in the absence of Parliament, he had personally decreed, were pronounced null and void. The provisional constitution was reestablished as the foundation of law in the land, and the restored Parliament (Aug. 1916) proceeded to discuss at great length the provisions of a new and permanent constitution. But under pressure of the disbandment military chiefs, Parliament was again dissolved (June 1917) without having completed the draft. A new Parliament, elected under revised laws (specially devised for the occasion by the nominees of acting President Feng Kuo-chang), met at Peking in Aug. 1918 and elected Hsü Shih-chang to the presidency on Sept. 4. A number of members of the old Parliament, led by the southern Cantonese party, declared the new Parliament to be illegally constituted and its proceedings, including the election of the President, invalid. They declared their intention and their right to regard themselves as the sole legal legislative body in the state, and in that capacity established themselves, a "Military Government," at Canton. In Aug. 1918, they appealed to the foreign Powers for recognition.
and support on the plea, inter alia, that they were fighting "to make China safe for democracy." Tested by the terms of the provisional constitution, neither the Peking nor the Canton Parliament was a legal body, and the military Government of the South could have no claim to constituted authority. But whatever the legal aspects of the dispute, the result of this discussion in the ranks of the mandarins was to produce a chronic condition of civil war, or rather of widespread brigandage and unrest, throughout the country, and to nullify the efforts of the genuine progressives and patriots for securing reform.

Immediately after the revolution of 1911, the executive authority in each province was assumed by the local military commanders (Tutus) in most cases natives of the province. Generally speaking, the administration resulting remained as before, in the hands of the bureaucracy, minus such control as the central Government had hitherto exercised. Under the dictatorship of Yuan (1913-6) that control was partially re-established, and to a certain extent the provincial and local administrations became once more responsible, if not subject, to the central Government. In May 1913, President Yuan defined and promulgated by mandate the conditions under which the official systems of provinces, districts and courts were to be administered, reestablishing the Supreme authority of the civil, as opposed to the military, mandarins. The provincial assemblies were suppressed, and the position of district magistrates strengthened. But after the death of Yuan no further attempts at centralization of the Government were possible, and as the result of widespread disorders the administration passed rapidly from the civil to the military mandarins. The Tuchuns (the military governors came then to be called) gradually usurped all the important functions of administrative authority; and even in those provinces (e.g. Chihli and Kwangtung) where the civil governor has continued to function as the chief executive, his policy and proceedings have conformed generally to those of his military colleague. According to the provisions of the permanent constitution advocated by the southern parliamentarians, the provincial administration is to consist of a civil governor, a military governor, an intendant (the Tsotai of the old regime), a district magistrate, and four heads of departments—general affairs, interior, education and commerce; but it is evident that, failing means to control the autocratic power of the military chieftains, no constitution can avail to secure uniformity of administration on these, or any other, lines.

As matters stand, the executive authority of the central Government is provisionally vested in a premier, nominated by the President, and a Cabinet of nine ministers, nominated by the premier. The Chinese name of the ministries have been changed since the abolition of the monarchy, but their general composition and functions remain practically the same. The nine ministries control respectively foreign affairs, home affairs, finance, army, navy, justice, education, commerce, and communications. There are five subsidiary departments, dealing respectively with Mongolia and Tibet, railways, telegraphs, audit and customs; to most of the ministries and departments a number of foreign advisers and technical experts have been attached.

The Civil Service.—Much of the political unrest and disorganization which have prevailed of late years in China is ascribable to the suddenness with which the ancient system of classical examinations for the public service was abolished by the Manchu Government in 1906, and to the subsequent failure of the republican administration to replace it by any practical and authoritative scheme which should ensure the continuity of the competitive principle. Under the new system of examinations introduced in的味道 of the Emprise Dowager, candidates for the civil service were required to display some knowledge of western science in addition to the Chinese classics. For four years of the republic, the system was even more rapidly modernized, the classics and philosophy being abandoned in favour of modern history, geography, law and science. But under the dictatorship of Yuan Shih-k'ai, this process was reversed, and knowledge of the classics restored to its place of eminence in the official curriculum. The general disorganization of public affairs and internal disorders prevalent since 1916 prevented the adoption of any comprehensive system applicable to, and accepted by, the whole nation; nevertheless, the holding of offices remains the chief highroad to wealth and distinction in China, and the number of aspirants to position under the Government is probably greater to-day than at any previous period in the history of the country. In those provinces where the authority of the central Government is recognized, the system now in force requires all holders of important posts to be possessed of diplomas or certificates. There are two classes of examination, one for those who hold important posts under the central Government and the other for clerks and minor posts in the provinces. Under the recent ancient regulations, a candidate for the holding high offices in their native province, or for a period exceeding three years, has been abolished.

Justice.—Towards the closing of the Mandarin reign, with a view to remove the stigma of barbarism attaching to the Chinese administration of justice, and thus to inducing the consent of the Powers to the abolition of the foreigners' extra-territorial rights, the Government of the day was advised to compile a provisional criminal code, abolishing the ancient Chinese methods and substituting barbarous methods of inflicting the death penalty. This new code, based on the continental model, was promulgated in 1912, the first year of the republic; it embodied most of the legislation imported by Western ideals of humanitarianism. But like many other changes prescribed at this period from Peking, it remained without appreciable effect upon the administration of justice in the provincial provinces. The अमल of the colonial administration, however, was almost universal, and all the methods of the criminal code have been in practice, providing for the imaginary needs of many different combinations. The new system, as laid down in these codes, provides for officials with purely judicial powers, for judges functioning respectively in the courts of First and Second Instance, in the provincial courts and courts of First Instance, but generally speaking these judges and courts, like trial by jury and the scheme of prison reform promulgated by the Ministry of Justice in 1912, have remained purely paper documents, and it remains unattainable so long as the central Government lacks not only the authority but the men and the funds required to carry them into effect. According to a statement published by the Ministry of Justice in 1913, the Courts of First Instance consist of 1309 judges, of whom 1105 are judicial officers, and 13 judges are provided; nevertheless, the remaining 19 districts hold only as many judges as are provided. The widespread brigandage and continual struggles for supremacy between rival Tuchuns, which became chronic conditions in most of the provinces after 1916, forbade all hope of effecting any general and permanent reform of the judicial system sufficient to justify the Chinese Government's aspirations in the matter of the abolition of extra-territorial rights.

Military.—As the result of the political disorganization prevailing since the death of Yuan Shih-k'ai, the Chinese army, as a national defense organization, practically ceased to exist, but the troops generally serving under one or other of the 22 Tuchuns (military governors) are gradually evolving into a body of disciplined and uniform soldiers, and the number of irregular and undisciplined forces was estimated by Chu Chi-chien (northern delegate at the Shanghai peace conference in 1919) at 1,209,357 men of whom 49,344 were supposed to be under the orders of the central Government; but, as the result of the political conditions and the strife of factions at the capital, the majority of the forces stationed in the metropolis and in Manchuria owed their allegiance to their respective Tuchuns, and even to the President in his individual capacity, rather than to the Ministry of War. In the words of a Chinese writer, the army has acquired provincial associations and lost its national character. In some cases, among the inadequately paid troops, it is sometimes impossible to distinguish between the soldiers and the brigands whom they are expected to suppress. The inability of the central Government to collect its revenues from the provinces, and thereby to make provision for the payment and control of a national army, has led to the creation of independent provincial forces, which have not only threatened the metropolitan Government in the provinces, but have restricted the central Government on the country at large. The disbandment of these forces is generally recognized in China to be a measure imperatively necessary, as a preliminary to the restoration of normal conditions.

Resurgence.—In November 1914, after the organization of the loan of 1913, a board of audit was established at Peking, with foreign expert assistance, to audit the revenues and expenditure of the central and provincial Governments; nevertheless, the only result of the organization was to shew that the Chinese central and provincial Governments were in a state of financial bankruptcy, and that the national finance were the published returns of the Inspectorate General of Customs and the revenue totals of the salt gabelle, collected under foreign supervision. The purely foro forma budgets,
issued at irregular intervals by the Government since the establishment of the republic, have no demonstrable relation to the facts of the situation, and no good purpose would therefore be served by quoting their respective figures, or by attempting to draw any conclusions from them. It will be sufficient, as an example, to show the sources of revenue and headings of expenditure recorded in the budget for the fiscal year July 1916-June 1917 (which balance to a tael) as follows:

<table>

| 11. Advances from Banks | 16,187,305 | Total Revenue | $391,083,470 |

**Total Revenue** $472,835,584

No budget was issued for the year July 1917-June 1918, a ministerial order having announced that the figures for the previous year would serve again. It is to be noted that the expenditure estimated under the heading of "Finance" includes the sum of $142,345,888 allocated for the service and amortization of loans; also, that the receipts and expenditure under the heading of "Communications" do not include the returns of Government railways or posts and telegraphs.

**Customs Revenue.**—The revenues collected by the Maritime Customs for the years 1916-20 were as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Revenue</th>
</tr>
</thead>
<tbody>
<tr>
<td>1916</td>
<td>37,764,311</td>
</tr>
<tr>
<td>1918</td>

<td>1919</td>
<td>46,090,160</td>
</tr>
<tr>
<td>1920</td>
<td>49,500,000</td>
</tr>
</tbody>
</table>

By agreement concluded between the Allied Powers and China in the autumn of 1918, the import tariff was revised and new duties fixed at specific rates, calculated to produce an effective 5% ad valorem levy. The Boxer indemnity payments were also suspended for a period of five years dating from Dec. 1, 1917.

The revenues reported to have been obtained from certain new taxes and duties imposed by the Government since 1912, and included in the 1916-17 budget under the heading "Income directly received by Central Government," were as follows:

<table>
<thead>
<tr>
<th>Tax</th>
<th>Revenue</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stamp Dues</td>
<td>$5,864,400</td>
</tr>
<tr>
<td>Tobacco and Wine Licence Dues</td>

<tr>
<td>1915</td>
<td>76,609,503</td>
</tr>
<tr>
<td>1916</td>
<td>67,590,603</td>
</tr>
</tbody>
</table>

In May 1921, however, the Times correspondent at Peking reported that in several provinces the military governors, unable to extract funds from Peking for the upkeep of their troops, were forced to sell, for the increased prices of the custom rates, to provide the necessary funds. This was particularly true of the provinces of Manchuria and Sinkiang, in the latter of which the provincial government had also been forced to sell, for the increased prices of the custom rates, to provide the necessary funds.

Whatever value the returns of provincial collections and remittances may have possessed under Yuan's dictatorship, as bases for future estimates, the results were conclusively nullified by the fiscal conditions which became chronic after 1916. Thereafter, the revenue of the central Government became confined to the surplus of the Maritime Customs, by suppressing the salt gabelle, the amalgamation of railways, and to loans; the last-named source of income consequently became that upon which the administration chiefly relied to maintain itself in power. From most of the provinces, none of the usual remittances to Peking were forthcoming; those to the North which had professed allegiance to the Government withheld their quota, generally on the ground that the disturbed condition of the country compelled them to devote all available revenues to the maintenance of their armed forces; in many cases they virtually demanded subsidies from the central Government as the price of their continued loyalty. Under these circumstances, the Government contrived to maintain its position by all means at its disposal; and the additional revenues needed, were advanced by Japanese banks and industrial syndicates under conditions which have been severely criticized in China and abroad. At the end of 1918, the Japanese Government, as announced in a note to China would "add to the complications of her internal situation," no further loans by Japanese capitalists would be sanctioned. In 1919 and 1920, the financial difficulties of the Government became acute, in spite of the increased revenues of the customs and salt gabelle and the suspension of the Boxer indemnities; they were met by desperate measures, such as the sale to local banks of Internal Loan (1912) bonds at almost any price, the rapid issue of large blocs of Treasury bills, and short-term bills of exchange. In July 1918, recognizing the necessities of the situation, and desiring to "strengthen China and lift her for a more active part in the war against the Central European Powers," the U.S. Government took the initiative of organizing a new Four-Power Consortium, for the purpose of making loans to China. After protracted negotiations, the Consortium was established (Oct. 1920) by the British, French, American and Japanese financial groups, for the purpose of procuring for the Chinese Government the capital necessary for a programme of economic reconstruction and improved communications; but inasmuch as the disbandment of the greater part of the Tuchuns' military forces had been recognized as a preliminary condition, essential to the undertaking of this programme, no immediate solution of the problem from this quarter was to be expected. In Feb. 1921, at the "Chinese New Year" annual settlement of debts, the Peking administration only avoided a disastrous climax of insolvency by yielding to a demand by the associated Chinese banks for the consolidation of the Government's internal debts. The new loan, of $100,000,000 is, therefore, the result of an arrangement demanded by the banks involved in the reorganization of certain revenues of the wine and tobacco monopoly, under foreign supervision and subject to the control of the inspector-general of communications, to provide for the regular service of the existing debt upon which amortization had been neglected. By virtue of this compact, the administration was enabled to meet its most urgent liabilities, but inasmuch as it was incurred by the amount of the funds thus allocated, it was evident that, failing means to restore normal fiscal relations between Peking and the provinces, it must remain fraught with serious danger. The nature of the situation prevailing, was significantly manifested by the terms dictated to the President of the republic and to the Ministry of Finance, in May 1921, by the three most powerful Tuchuns of the North, involving the compromise of certain revenues for the maintenance of their increased and increasing forces.

**China's Indebtedness.**—At the end of 1916, the amount required to meet the service of China's officially stated foreign debts was
Agricultural Products.—The principal industry of China is agriculture, and its perpetual functions have been to produce the rice upon which the supply of all staple food depends. Each year produced new economic factors as the wide-spread revulsion of the economic depression of 1927-1929, and the cultivation of the poppy had been regularly suppressed by the scale Fukien. Between 1910 and 1919, the area under cotton cultivation and weaving industries at Shanghai, Hankow, Tientsin, and other Shantung, Honan, Hupei, Kiangsi and Chekiang. The total production of raw cotton in 1919 was estimated at 12,000,000, a country, similar to that of the cotton-growing provinces of the country's agricultural economy, and it is estimated to diminish the nation's other crops and also to have reached its high point and to be in many parts of the country, the high level of 1914 and 1915. The cultivation of the new chief crops for rice was so intensive that the south of China was deprived of its output of staple supplies from Indo-China and Burma; conversely, the staple food of these countries rose to unprecedented prices. Other recent features of the currency situation are the rapid extension of the bean-growing (combined with a steady increase of the flax industry) in Manchuria and the northern provinces of wheat cultivation in various parts of the whole district, and the Chinese people in certain districts, and on the other, the increase of the productive powers that have been created by the Chinese in recent years. In 1919, the total export of flour was 194,071,441, with which the Chinese in 1919, 1916, the silver dollar Yuan Shi-kai were minted at Tientsin in large numbers; there had been the mints at Nanking and Wuchang. A memorandum of the Ministry of Finance in 1918 put the total coinage of new dollars (of 89.5% silver content) at 220,183,000, against which the currency law promulgated in March 1914 was intended to give a standard value. A code of regulations which was subsequently adopted by Dr. G. Vissering, the head of the government, the mints, the branch banks, and the large commercial banks, was framed by the mints and by the government officers in conformity with the requirements of the new law. In Aug. 1918, the Minister of Finance established a currency department under the direct control of the opposition was so strong that it was indefinitely postponed. The chaotic conditions of the metal currency have been aggravated by the fact that numerous small banks and provincial coin banks have been forced to close and to cease operations, and by the Bank of China and the Bank of Communication of the decrease in prices which were at the Bank of China and Bank of Communication which were at that bank. The Bank of China and Bank of Communication of 1910. These small banks were not of any importance and already in 1910 were at a discount. The Peking notes of 1910 were at a discount of 9%, and during the revolution, the currency unsoundness went to 30% and more. During the revolution, the currency unsoundness went to 30% and more. Many of the provincial banks, which were thoroughly organized in the treaty ports, the number of Chinese banking businesses in China has increased greatly, the majority of the banks being Japanese. Many Chinese banks, including several branches of the American. In 1921 the Native Bankers' Association of China was formed for the purpose of increasing influence; it restricts its membership to banks conducting business in China and the United States.

Co., the construction of wireless telegraph stations was commenced in 1919; wireless telephony was also introduced by the Chinese National Wireless Co., using the Marconi patents; but it remains to be seen whether these or aeroplanes can be made to serve any large public purpose in China.

Commerce.—Amongst several noteworthy changes which occurred in the commerce of China during the period 1911-21, the most important were the elimination of the lawful traffic in imported opium, and the exclusion of foreign general merchandise. The volume of commerce in foreign trade increased, and in 1921, a period of economic depression, the total value of the Chinese foreign trade, at the value of goods actually exported, was £131,049,536, as against £151,580,997 in 1913. But the increase of commerce in the last ten years has been mainly due to a rise in the volume of foreign trade in Chinese raw materials, and not in manufactured goods. In 1913 the value of Chinese exports amounted to £82,560,458, and in 1921 to £131,049,536, an increase of £48,489,078, or 58.5 per cent. Of the total exports in 1921, £49,319,994 (or 38 per cent) was for raw materials, £28,524,805 (22 per cent) for manufactured goods, and £53,204,737 (41 per cent) for other articles, including marine and air transport, and for miscellaneous goods.

The imports in 1921 amounted to £131,049,536, of which £55,840,475 (43 per cent) was for raw materials, £61,040,061 (47 per cent) for manufactured goods, and £14,169,000 (11 per cent) for other articles, including marine and air transport, and for miscellaneous goods.

The principal foreign countries from which China imported goods in 1921 were: Japan, £55,840,475 (43 per cent); the United States, £28,524,805 (22 per cent); and Great Britain, £14,169,000 (11 per cent). The chief foreign countries to which China exported goods were: Japan, £49,319,994 (38 per cent); the United States, £28,524,805 (22 per cent); and Great Britain, £10,949,651 (8 per cent).

The figures for the chief foreign nations concerned are as follows:

The sterling value of China's exports for 1919 was 228% higher than that of the pre-war year 1913. In the order of their importance the chief articles of export are: silk (representing over 100 million taels), tea, beans, teacake, oranges, honey, and tea, metals and sugar. The silk trade reflected the increased purchasing power of the United States foreign loans, resulting in the suspension of several enterprises, projected and commenced. Several important agreements had been concluded by the Chinese Government in 1913 and 1914 for the extension of the American lines; these were compelled to await the restoration of conditions favorable for financing these undertakings abroad. The railways for which preliminary or final agreements were thus concluded, included the following:-

The British (Franco-Belgian concession) (British capital); approximately 900 m. This line forms part of a general scheme intended to provide through communication between French Indo-China and Kalga, connecting at Tatung with the Peking-Kalgan railway extension, with France, and with Shanghai, and with Sinkiang (near Pakhoj) to Yüniuhu, and thence to Chching-hung (French capital); about 1,000 m.

The annual reports on Chinese Government railways, subsequently published by the Ministry of Communications, afford a comprehensive statement of the financial and general situation. The following figures are taken from the Ministry's report for the year ending Dec. 31, 1919,-

The total length of railway lines in China at the beginning of 1919 was 6,043 m. (10,000 km). The total length of Government and "Concessional" railways as shown by the reports of the Ministry of Communications, in 1919, was 6,244,727 m. (10,470 km). The total length of Chinese railways at the end of 1919 was 6,410 m. (10,600 km).

Total Government Railways 6,410

Provincial and Private Railways.

Total 10,953 km.

Excluding the dependencies (Mongolia, Turkestan and Tibet) China has about 270 sq. m. of territory and 45,000 inhabitants to each mile of railway, as against 34 sq. m. and 6,800 inhabitants per mile in Japan. The Ministry's report showed a surplus of $16,499,329 on the new line of the Government lines for the year 1919, and an increase of $2,044,727 as compared with 1918. The profits per kilometre carried by the principal lines varied considerably. The profit per kilometre on the Peking-Mukden railway was $9,624,341 on the Peking-Hankow $5,072,378 on the Hsingan, $4,646,301 on the Kaifeng-Hunan, $3,957; on the Shanghai-Nanking, $3,288, and on the Tientsin-Pukow, $2,848. On Dec. 31, 1919, the accumulated surplus of the Chinese Government railways, as shown by the Ministry's report was $56,000,000 (of which sum $56,000,000 consisted of additions to property, 21 millions funded debt retired, and cash on hand over 22 millions (of the last amount 21½ millions consisted of the reserves of the Bank of Communications and Bank of China, then circulating at about 50% of their face value). The net revenues of railways under the Ministry's control increased by 64 between 1913 and 1919; it is, however, typical of Chinese enterprise to say that, after showing such extraordinary results, the Government should have been unwilling or unable to purchase the rolling stock required for a section of the Hankow-Canton line (costing $2,000,000) without having recourse to a new foreign loan.

Telegraph.-In 1912 the head office of the Chinese Telegraph Administration, until then located at Shanghai, was transferred to the Telegraph Bureau of the Ministry of Communications at Peking and a uniform scale of charges was introduced. In 1915, the total length of lines in operation was 42,518 m. with 710 stations. The rates in force (increased in 1920 in aid of the famine relief fund) are high, and messages in foreign languages are charged 50% more than for English. For the first time in the history of the telegraph, the British government in 1919-20, the rate for telegrams in English was roughly equivalent to 6d., a word for messages in the same province, and 1s. a word to other parts of China. A few foreigners (Danes) are still employed in the telegraph administration, but after showing such extraordinary results, the Government should have been unwilling or unable to purchase the rolling stock required for a section of the Hankow-Canton line (costing $2,000,000) without having recourse to a new foreign loan.

The postal service of China, originally organized as a branch of the Imperial Maritime Customs, was separated from that administration and placed under the Ministry of Communications in 1911. Under the republic it has remained a department of that Ministry, but responsible for its own budget and organization. Since 1911 the department has been controlled by a Chinese director-general and a French associate director. Its activities extend.
not only over the eighteen provinces, but throughout the New Dominion and Manchuria.

The growth of its progressive development and usefulness has been recognized in spite of the disturbing conditions and disorders prevalent throughout most parts of the country since the revolution. During the three years 1916–8, after the death of Yuan Shih-k'ai, postal operations at the provincial capitals in these provinces were seriously hampered by the depredations of bandits and the lack of postal clerks. Although Shensi alone, 78 post-offices were lost in 1918. Nevertheless, in that year the number of district offices and agencies increased to 2,269 (see p. 299), and 27,000 persons were in correspondence with a foreign staff of about 110. The growth of the service is shown by the following figures:—

Money orders increased from ten million dollars in 1913 to thirty-five millions in 1918. The earnings of the department in 1918 were $9,500,000 and showed a profit of $1,910,000 over working expenses, as compared with a surplus of $305,000 in 1915. China joined the Postal Union in 1914. On March 1 1917 an agreement was concluded with Great Britain for the direct exchange of postal parcels, and later in the same year a similar arrangement was made with the Russian postal administration for parcels crossing the Russo-Chinese frontier. In 1921 the Treaty Powers still maintained their own post-offices in many places for the despatch and receipt of mails from overseas, and in certain instances the operations of these extra-territorialised offices were on a par with those of the parcel post. The agreement on parcel post worked to the detriment of China's postal service and inland revenues. The number of post-offices maintained by the Powers in 1921 was as follows: Great Britain, 11; France, 15; Japan, 21 in China and 23 in Manchuria; Germany (before the war), 17; Russia (before the war), 28; United States, 1. (J. O. P. B.)

CHIROPRACTIC, the name given to a method of healing employed in the United States, based on the theory that most disease is the result of displacement of the vertebrae of the spinal column, resulting in abnormal pressure upon the nerves as they emerge. It is held that the articular joints are frequently thrown out of alignment, it may be only in slight degree, and the constricted nerves are thereby prevented from transmitting to the various parts of the body the mental and bodily sensation. The body is畅通, and it is claimed that the nerves emanating above each vertebra regulate particular organs; hence the cause of different diseases can as a rule be readily localized. Health is possible only when all the organs function harmoniously, and disease of one organ may affect some other. The chiropractor attempts to find the subluxated joint, and with the bare hand to adjust it. He never resorts to drugs or surgery; he merely tries to relieve the impinged nerve and leaves the rest to nature.

The first reported healing by chiropractic was made in 1891, when a young man near Toronto, Canada, March 7 1891; d. at Los Angeles, Cal., Oct. 13 1913), a “magnetic healer” in Iowa treated a man who had been dead for 17 years. He claimed to have discovered that a displaced vertebra was pinching a certain nerve and that its adjustment was quickly followed by complete restoration of hearing. Little was done to work out a theory in detail until 1903, when Dr. B. J. Palmer (b. Sept. 10 1881), a son of the discoverer, began its formulation, resulting in the development of a well-defined system of articular adjustment with the hands. He established the Palmer School of Chiropractic ("Chiropractic Fountain Head") at Davenport, la., which remained the best known. Numerous later methodists were founded in different parts of the United States. The course of study extends over three college years of six months each, and the subjects studied correspond with those of the usual medical school, materia medica alone being the only part of it. (See CHIROPRACTIC.)

CHISHOLM, HUGH (1866–1920), editor of the Encyclopaedia Britannica, was born in London Feb. 22 1866, of Scottish descent. His father, Henry CHISHOLM (see 25:772), was the son of John CHISHOLM of Auchabuck (1766–1852)—private secretary and librarian for many years to the Earl of Cowley (auditor of the Exchequer; Prime Minister 1866–7), by whom he was given a clerkship in the Exchequer,1 eventually becoming senior clerk in the Exchequer Bill Office and King's Agent for Sierra Leone and the

1 As set of the 5th ed. and supplement of the Encyclopaedia Britannica, inherited by his son and grandson, was purchased by him out of the allowance made for “stationery” to clerks of the Exchequer in those days—a form of perquisite in addition to salary.

Gold Coast—whose paternal grandfather had left Inverness-shire and settled in London early in the 18th century. Henry Williams CHISHOLM (1890–1902) entered the Exchequer in 1824 with a nomination from Lord Grenville, rising to be head of its official staff in 1862 as chief clerk; and on the abolition of the Exchequer in 1866 as a Government department coordinate with the Treasury, he was appointed, under the Weights and Measures Act (1867), head of the newly created Standards Department of the Board of Trade, occupying the old Exchequer office 7, Old Palace Yard, Westminster, with the official title of Warden of the Standards. At the Exchequer he acquired a recognized authority on public finance; and his “Great Account” (see 10:58), published in 1869 as a Parliamentary Return in 3 vols., dealing in detail with the history—unrecorded till then —of the public revenue and expenditure of Great Britain and Ireland since 1868, and of the origins of the whole British fiscal system, was the outcome of 10 years’ laborsome research. As Warden of the Standards he was the British delegate to the International Metric Commission at Paris from 1870 to 1875, and took a leading part, as a member of its permanent scientific committee, in preparing and promulgating the newly adopted international standards. At the desire of the Government his retirement from office was postponed for this purpose till the end of 1876, when he had been 52 years in the public service. His “Recollections of an Octogenarian Civil Servant” were published in Temple Bar (Jan. to April 1891).

Educated at Felsted school, and at Oxford as a scholar of Corpus, Hugh CHISHOLM graduated in 1888 with a first class in Literae Humaniores, and then read for the bar, being “called” at the Middle Temple in 1892; but he had already then drifted into London journalism. From 1892 to 1897 he was assistant editor, and from 1897 to the end of 1899 editor of the St. James's Gazette (see 19:661); and during these years he also contributed numerous articles on political, financial and literary subjects to the weekly journals and monthly reviews, becoming well known as a literary critic and Conservative publicist. On resigning the editorship of the St. James’s, he became a leader-writer for the Standard, and later in 1900 was invited to join The Times, under whose management he acted as the responsible co-editor, with Sir Donald Mackenzie Wallace and President Hadley of Yale University, of the new volumes, constituting it a complete work. He was appointed editor-in-chief of the Encyclopaedia Britannica in 1903 he was appointed editor-in-chief of the 11th ed. which was completed under his direction in 1910, and published as a whole by the Cambridge University Press, in 29 vols., in 1911. He subsequently planned and edited the Britannica Year-book (1913). Rejoining The Times in 1913 as day-editor, and a director of The Times Publishing Co., he became financial editor at the end of that year, and occupied this responsible position all through the momentous period of the World War, resigning his connexion with The Times in March 1920 in order to reassume the editorship of the Encyclopaedia Britannica and to organize the publication of the New Volumes constituting the 12th edition.

CHOATE, JOSEPH HODGES (1832–1917), American lawyer and diplomat (see 6:28), died in New York May 14 1917. Upon the outbreak of the World War he ardently supported the cause of the Allies. He severely criticized President Wilson's hesitation to recommend America's immediate cooperation, but shortly before his death retracted his criticism. He was chairman of the mayor's committee in New York for entertaining the British and French commissions in 1917. His death was hastened by the physical strain of his constant activities in this connexion. Among his last works were Abraham Lincoln and Other Addresses in England (1910) and American Addresses (1911).

See Edward Sanford Martin, The Life of Joseph Hodges Choate (1920).

CHRISTIAN SCIENCE (see 6:291).—In 1910 the total number of Christian Science churches was 1,201 (1,077 in the United States, 38 in England, 38 in Canada, 28 elsewhere); on Jan. 1 1920 the number was 1,804 (1,590 in the United States, 98 in England, 46 in Canada, 70 elsewhere). As a Christian Science church invariably has two readers, the one to read the Bible,
the other to read the text-book (Science and Health with Key to the Scriptures), the number of readers in 1910 was 3,402 and in 1920 was 3,688. Statistics of membership are never issued officially; and in 1921 there was nothing later on the subject than the Report on Religious Bodies, published in 1908 by the U. S. Bureau of the Census, showing in the United States in 1906 85,717 members, of whom about 72% were women.

After the death in 1910 of Mary Baker Eddy, the founder and director of the denomination, the board appointed by her became the governing body of the church. Mrs. Eddy’s estate, amounting to $2,500,000, was left for the promotion of Christian Science, and in 1914 the trustees announced that the income would be used in providing lectures, in distributing authorized literature throughout the world, in establishing libraries in connexion with churches, societies, and reading-rooms, and, so far as possible, in helping towards the erection of church buildings. Upon the outbreak of the World War in 1914 the Christian Science churches in Paris organized relief activities for war sufferers, and at the end of the year the board of directors of the Mother Church (the First Church of Christ, Scientist, in Boston, Mass.) appointed a War Relief Committee. Funds were raised from their own members and distributed through authorized representatives. The total receipts were $120,700, of which $84,400 had been forward for distribution. In 1917, after the entrance of the United States into the war, a Camp Welfare Committee was appointed, over 100 welfare rooms were opened in the United States, Canada and Great Britain, and approximately $130,000 expended on buildings and equipment. More than 2,000 persons served without compensation as camp welfare workers and in other capacities. The denomination had nine chaplains in the army and one in the navy. The total amount raised for war work approximated $2,000,000.

The decade 1910-20 witnessed considerable disension within the church. In 1909 the board of directors of the Mother Church in Boston expelled from the church Mrs. Augusta E. Stetson, who since 1890 had been pastor of the First Church of Christ, Scientist, of New York City. It was charged that Mrs. Stetson was using her influence to insure her succession to the headship of the denomination after Mrs. Eddy’s death. This was denied by Mrs. Stetson, who in turn charged the directors with promoting a false and materialistic interpretation of Mrs. Eddy’s writings. Although defended by a large number of followers, she quietly resigned her New York pastorate. In 1913 she published her side of the case in Reminiscences, Sermons and Correspondence Proving Adherence to the Principle of Christian Science as Taught by Mary Baker Eddy. In 1919 a serious dispute arose between the trustees of the Christian Science Publishing Society and the board of directors of the Mother Church. The trustees claimed that the board aimed to create an oligarchy, and was trying to usurp their powers. They denied that they were the under the jurisdiction of the board, which, in turn, claimed supreme authority. Through counsel (among whom was Charles E. Hughes) the trustees secured in 1919 a temporary injunction, restraining the board from interfering with the trustees of the publication society. At first the courts seemed to support the contention of the trustees; the majority of the churches apparently sided with the directors. Several cases were reported in which persons associated with the trustees’ publications were forbidden by churches to teach in Sunday-schools. The injunction was set aside Nov. 23 1921.

In 1921 the church was issuing the following periodicals: The Christian Science Quarterly Bible Lesson; The Christian Science Journal, Der Herald der Christian Science, a monthly, with pages alternately in English and German; Le Hérald de Christian Science, a monthly, with pages alternately in English and French; The Christian Science Sentinel, a weekly; and The Christian Science Monitor, an excellent weekly, published in Boston.

CHRISTIAN GEORGE (1831-1911), British mathematician, was born near Aberdeen March 8 1831. He was second wrangler at Cambridge in 1875, and was appointed successively professor of mathematics at St. Andrews in 1877 and at Edinburgh in 1879, holding the latter post till his death. He was the author of a standard treatise on algebra as well as of many publications on physical and mathematical subjects, and his researches into the surface oscillations of Scottish lakes won him a Royal medal from the Royal Society. He died at Edinburgh Nov. 3 1911.

CHURCH, ALFRED JOHN (1829-1912), English classical scholar, was born in London Jan. 29 1829. Educated at King’s College, London, and Lincoln College, Oxford, he took holy orders and was assistant-master at Merchant Taylors’ school for many years. He was professor of Latin at University College, London, from 1859-85, and, in partnership with W. J. Brodrick, translated Tacitus, Tacitus: The Stories of the German Wars, in 1874. Here he edited the first English re-telling of classical tales and legends for young people (Stories from Virgil, Stories from Homer, etc.). He wrote much Latin and English verse, and in 1908 published his Memories of Men and Books. He died at Richmond, Surrey, April 27 1912.

CHURCHILL, WINSTON LEONARD SPENCER (1874- ), American writer, was born in St. Louis, Nov. 10 1871. He graduated from the U. S. Naval Academy in 1894. He was conspicuous alike in scholarship and in general student activities. He became an expert fencer and he organized at Annapolis the first eight-oared crew of which he was for two years captain. He had already decided upon a career in the diplomatic service, but was prevented from taking this course by his personal appearance. He was appointed for a time connected with the Army and Navy Journal. In 1895 he became managing editor of the Cosmopolitan Magazine; but in less than a year he retired that he might have more time for writing. His first novel, after being twice rejet, appeared as The Celebrity, in 1898. His next book, Richard Carvel, appeared in 1899 and had a sale of almost a million copies. Its scene is Maryland during the American Revolution. His next work, The Crisis (1901), opens in St. Louis in the days of the Civil War. The heroine, Is the great-granddaughter of his former hero, Richard Carvel. The intervening period of western expansion, following the Louisiana Purchase, is depicted in The Crossing (1904). His other works are: Coniston (1906, the career of a post-bellum political boss); Mr. Crewe’s Career (1908, the railroads in politics); A Modern Chronicle (1910); The Inside of the Cup (1913, the 20th-century Church); A Far Country (1915, methods of ‘big business’) and The Dwelling Place of Light (1917). All his novels treat of phases of American development, historical or social, and form a sort of chronological sequence. He has written a play in three acts, Dr. Jonathan (1919). Mr. Churchill took an active part in state politics. From 1910 to 1912 he was a member of the Legislature of New Hampshire, and in 1912 he was an unsuccessful candidate for governor on the Progressive ticket.

CHURCHILL, WINSTON LEONARD SPENCER (1874- ), English statesman (see 6,347). Mr. Churchill’s tenure of the presidency of the Board of Trade, from April 1908, was marked by the production of a scheme in the autumn of that year for the setting up of a court of arbitration in labour disputes, consisting of three persons nominated by the Board, respectively from panels of employers, workmen and “persons of eminence and impartiality.” He was welcomed on behalf of the Government at Eight Hours Miners hill. In 1910 he was appointed to the Home Office. Here he had to deal with the dangers arising from the increasing horde of undesirables who poured into the East End of London. He was present in person at an extraordinary affair in Sidney St., Mile End Road, on Jan. 3 1911, when the police, after a time reinforced by soldiers, were kept at bay for many hours by two foreign burglars who defended themselves in a house with Mauser pistols, and who ultimately perished when the building caught fire and was burnt.

In the autumn of 1911, to the surprise of the public, an exchange of offices was effected between him and Mr. McKenna, and he became First Lord of the Admiralty. Hitherto he had been wont to pose as a disbeliever in the German menace, and an advocate of reductions in British armaments. In Aug. 1908, for instance, he rebuked Lord Cromer for uttering grave words of warning, and ridiculed the bare possibility of an Anglo-German conflict in arms. Early in 1909 he had assisted Mr. Lloyd George in the Cabinet in his unsuccessful endeavour to cut down Mr.
McKenna's estimates. But the Agadir crisis of July 1911 seems to have opened his eyes as it did those of Mr. Lloyd George. At any rate, he spoke at Guildhall on Lord Mayor's Day in a worthy manner; admitting that the growth of the German navy was a main factor in British construction, and pointing out that no power was better able to bear the strain or less likely to fail than Great Britain. Similarly at Glasgow in Feb. 1912 he submitted that naval power to the Germans was a luxury; it was existence to the English, it was expansion to them. "We shall face the future as our ancestors would have faced it, without disquiet, without arrogance, but in solid and inflexible determination. He had the heart and the wisdom of a naval war staff, and in the autumn he reorganized the internal administration of his office. The same tone was maintained in his speech on introducing the naval estimates. If any one nation, he said, were able to back the strongest fleet with an overwhelming army, the whole world would be in jeopardy. Great Britain must never conduct her affairs so that the navy of any one power could engage her at any moment with a reasonable prospect of success. He announced a complete reorganization of the navy, which was to be grouped in four fleets, three being for home defense and the fourth spread out on various posts (the fleet previously based on Gibraltar), and the fourth, based on Gibraltar, to operate either in home waters or in the Mediterranean. The significance of this new orientation was at once perceived. It was hailed with satisfaction by the Unionists, but the purely economists complained that he had thrown sobriety and thrift to the winds. These changes were mainly due to the inspiration of Lord Fisher, and of Sir Arthur Wilson, Lord Fisher's successor as First Sea Lord. There was a slight decline of £300,000 in the total of these estimates; but this was merely a pause after the £13,000,000 increase of the past three years; and by the suppression of a new German navy law necessitated a supplementary estimate of about a million. In 1913 there was a further increase of about a million and a quarter. Once more a supplementary estimate, largely due to aircraft development, added two millions and a half; and in 1914 Mr. Churchill introduced the highest estimates hitherto on record, £31,550,000 — an increase on the total of 1913 of some two millions and three-quarters. He grasped, moreover, at an early date the vital importance of oil fuel, and forwarded eagerly the arrangement by which oil was to be obtained for the navy from Persia. Meanwhile Lord Fisher had thrown out the estimates of his scheme to Germany that all naval Powers might well take a year's holiday from shipbuilding; but, though he repeated and emphasized his plea for this " naval holiday " in a speech in the autumn of 1913, it met with no response from Berlin. Large as the estimate for 1914 was, it was attacked by naval experts as inadequate.

There would perhaps have been more general satisfaction with the results of Mr. Churchill's undoubtedly energetic and patriotic administration at the Admiralty, if he had not shown himself so vehement a partisan in internal politics. But he was in the van of controversy over the Parliament bill, over Home Rule, and especially over the Ulster resistance. "By hell ahead," was his motto for his party in the turbulent session of 1911. In Feb. 1912 he made a daring incursion into Ulster, in order to advocate Home Rule at Belfast; but he was wise enough to give up his original intention of making the Ulster Hall, with its Orange and Protestant associations, the scene of his meeting, and also to represent the Government plan as an integral part of parliamentary devolution. He developed this line of argument when moving the second reading of the Home Rule bill in April, and at Dundee in the autumn outlined a general policy under which England would be cut up into self-governing areas. But both in the House and at Dundee he emphatically declared that Ulster, though she had a claim to special treatment, must not be allowed to bar the way. Next year he declared at Dundee in Oct. that, if a single province could interpose a "bulky's veto," constitutional and peaceful agitation would be discredited throughout the British Empire and the civilized world. But the speech which most exasperated his political opponents was one which he delivered at Bradford in March 1914, just after the incident of the Curragh. Against any attempt in action to subvert parliamentary government, there was no lawful measure, he said, from which ministers would or could shrink. If British civil and parliamentary systems were to be brought to the challenge of force, he could only say "Let us go forward together and put these grave matters to the proof." His dispositions of naval forces in the Irish Channel were bitterly resented by the Unionists, who accused him of being in a "plot" to provoke Ulster to armed resistance and then coerce her. In return, he described these accusations as "a vote of censure by the criminal classes on the police," and averred that the measures taken were purely precautionary.

These controversies were stilled by the war. Here Mr. Churchill showed that he appreciated the situation better than the majority of his colleagues. On Monday, July 20, at Spithead, there was a great review by the King of the most powerful fleet ever assembled, numbering some 200 vessels in all, manned by 76,000 officers and men. While the ships were still engaged in tactical exercises, Austria's ultimatum to Serbia was issued (July 23) and the 12 anxious days which culminated in the World War began. In the ordinary course the fleet would have been deployed or deployed itself, through the close of the month, but the British Admiralty had been disturbed, the First Lord and the First Sea Lord (Prince Louis of Battenberg, afterwards Lord Milford Haven) took the responsibility of keeping it on a war footing, ready for action. Hence, when the rupture occurred, the fleet was already at its stations in the North Sea, and Adml. Jellicoe was promptly appointed commander-in-chief. The Expeditionary Force was conveyed across the Channel in perfect safety, and its communications safeguarded; and the German mercantile marine was soon cleared from the seas. But there were some naval disasters for which the public were not prepared. The German battle cruiser "Goeben" eluded the British Mediterranean fleet and got safe into the Sea of Marmora; three British cruisers were sunk by submarines in the North Sea; and a British squadron under Adml. Cradock was heavily defeated by a German squadron off the coast of Chile. Prince Louis of Battenberg, a most patriotic and capable sailor, unjustly attacked because of his German origin, tendered his resignation as First Sea Lord, and Mr. Churchill put in his place the indefatigable veteran, Lord Fisher. Meanwhile Mr. Churchill heartened his countrymen by patriotic speeches at a non-party meeting in the London Opera House in Sept., and at Guildhall in Lord Fisher. He tried to anticipate the German war plans and the increasing activity of German submarines gave Mr. Churchill and the Admiralty much concern. He determined to treat prisoners captured from submarines, in view of their breaches of the laws of war, with more severity than ordinary prisoners; but the Germans retaliated harshly on the most noteworthy English prisoners in their hands, and Mr. Balfour, on succeeding Mr. Churchill, gave up this discrimination. But Mr. Churchill's great coup in the war was the attack on the Dardanelles, which he pressed forward in spite of the increasing reluctance of Lord Fisher. The idea was a captivation one, and an appeal from the Russians for help in that quarter was difficult to resist. It is arguable, and he was disposed to maintain, that the movement would have succeeded if resolutely pushed by those in command, both in the initial stage, when it was a purely naval attack, and in the later stage, when considerable military forces had been landed and fought many desperate fights. But, in fact, it failed; and the friction engendered between the First Lord and the First Sea Lord was one of the causes which drove
Mr. Asquith to invite the Unionists in May to join in a Coalition Government. A change at the Admiralty was imperative. Mr. Churchill had shown enormous vigour, industry, imagination and patriotism; but insufficient judgment and discretion. He was transferred to the sinecure office of the Duchy of Lancaster, but held it only till Nov., when, on the appointment of a small war committee of the Cabinet from which he was excluded, he resigned, being unwilling to accept a position of general responsibility for war policy if he had no effective control. He placed himself at the head of the military authorities and the Home Guard, as a major in the Grenadier Guards. He was accordingly little seen in Parliament for the next year or more, though he was in his place to criticize the navy estimates of his successor Mr. Balfour, to reproach him for want of energy, and to recommend the recall of Lord Fisher.

The report of the Dardanelles commission, which was published in March 1917, confirmed the view of the public that some of the blame for that mismanaged enterprise rightly attached to Mr. Churchill. It was therefore with surprise and some disappointment that people found Mr. Lloyd George, who appreciated his powers, adorning the highest office in the land. On July 17, 1917, he was made Minister of Munitions, a post in which he did good work for a year and a half, but did not come specially before the public. After the war, however, when Mr. Lloyd George reconstituted his Government, he became Secretary of State both for War and for Air, a conjuncture of offices which was much criticized. As War Minister he had the gigantic task of demobilizing armies of between four and five million men who had been in the war, of providing armies of occupation and forces for immediate garrisoning of the Empire, of building up an after-war army, and of re-creating the territorial army. He made considerable progress in the following two years, but he was greatly criticized for the size of his estimates, and especially for the large forces retained in Mesopotamia and Palestine. On Lord Milner's retirement in the spring of 1921 he succeeded him as Secretary of State for the Colonies; and a new arrangement was made by which the responsibility for Mesopotamia and Palestine was taken over by the Colonial Office. Mr. Churchill went out to Egypt, and held in Cairo a conference of the British civil and military officers then administering those countries. On his return, he outlined to Parliament a scheme by which the cost might be greatly reduced, mainly through the use of air forces, and of the services of the Mesopotamian and Palestinian forces.

Mr. Lloyd George had left his wife and three daughters. His mother, Lady Randolph Churchill, divorced her second husband, George Cornwallis-West, in 1913; and married in 1918, as her third husband, Montague Chippen Porch, formerly a Government official in Nigeria. She died June 29, 1931.

(G. E. B.)

CHURCH HISTORY (see 6,330).—I. CHURCH OF ENGLAND (see 9,442). The most important event in the Anglican communion in the decade 1910-20 was the sixth Lambeth Conference, held at Lambeth Palace under the presidency of the Archbishop of Canterbury from July 5 to Aug. 7, 1920. There were present 252 bishops, as compared with 276 at the one of 1888 and 270 at the one of 1908. The total of 134 at the first gathering in 1867. These Conferences claim no conciliar or legislative authority, i.e. it is left to the various branches of the Church throughout the world to act upon their decisions or recommendations, in whole or in part, or to ignore them altogether. Their claim is to present a consensus of Anglican opinion upon subjects vitally affecting the welfare of the Church and the world, and to set forth, so far as diverse conditions may admit, general principles of action. The subjects considered at the Conference of 1920, in the order in which they are arranged in the Encyclical Letter within the bishops, are: (1) the relationships of the Church to paganism, (2) the relationship of Church and State, (3) the relationship of Church and the State, and (4) the relationship of Church and the State.

Reunion of Christendom.—By far the most momentous of these subjects is the reestablishment of the broken unity of the universal Church, and in relation thereto the Conference put out an "Appeal to all Christian people." This document recognizes that the causes of division lie deep in the past, and are by no means simple or wholly blameworthy, but insists that the time has come for a new outlook and new measures, and for reaching out towards the goal of a reunited Catholic Church. The essentials of visible unity are defined as the acceptance of the Scriptures as the ultimate standard of faith, and of the Nicene Creed as the sufficient statement of that faith, of the sacraments of Baptism and the Holy Communion, and of a ministry acknowledged by every part of the Church as possessing not only the inward call of the Spirit, but also the commission of Christ and the authority of the whole body. On this last, but most crucial point, upon which the real difficulty of reunion turns, the bishops say:

"May we not reasonably claim that the Episcopate is the one means of providing such a ministry? It is not that we call in question for a moment the spiritual reality of the ministries of those Communities which do not possess the Episcopate. On the contrary we thankfully acknowledge that these ministries have been manifestly blessed and owned by the Holy Spirit as effective means of grace. But we submit that considerations alike of history and of present experience justify the claim which we make on behalf of the Episcopate. Moreover, we would urge that it is now, and will prove to be in the future, the best instrument for maintaining the unity and authority of the Church. For the ministry of the Bishop of a Bishop should be everywhere exercised in a representative and constitutional manner, and more truly express all that ought to be involved for the life of the Christian Family in the title of Father-in-God."

By way of practical suggestion the Appeal goes on to say:

"If the authorities of other Communities should so desire, we are perfectly willing that terms of agreement with us should be formally adjoined. Bishops and clergy of our Community would willingly accept from these authorities a form of commission or recognition which would commend our ministry to their congregations, as having its place in the one family. It is our hope that the same motives would lead ministers who have not received it to accept a commission through episcopal ordination, in obtaining for them a ministry throughout the whole fellowship."

The resolutions, of which the Appeal formed part, recommended that the Churches of the Anglican Communion should invite conference with other religious bodies concerning the possibility of taking definite steps to cooperate in a common endeavour on these lines to restore unity. In the committee's report it was suggested that authority might be given to bishops to permit ministers not episcopally ordained to preach in churches within their dioceses, and to their own clergy, to preach in the churches of such ministers, and "in the few years between the initiation and the completion of a definite scheme of union," to admit to Communion baptized but unconfirmed communicants of the non-episcopal congregations concerned. The bishops, however, disapproved of "general schemes of intercommunion or exchange of pulpits." It was expressly stated that these decisions were "all but unanimous." In further pursuance of the desire for reunion the Conference approved of Anglican bishops taking part in the consecration of Swedish bishops, being satisfied that those bishops possess the Apostolic succession, and on Sept. 19, 1920 the bishops of Durham and Peterborough joined in the consecration of the Swedish bishops of Västerås and Västerås. Both before and after the Conference rapid progress was made towards a better understanding between the Church of England and the Orthodox Eastern churches.

Ministry of Women.—The committee of the Conference was of opinion that there is nothing to prevent the belief that the Apostolic commission recorded in St. John xx. 19-23 was delivered to women as well as to men, and dealing with the disciplinary directions of St. Paul as to the subordination of women in churches as a general rule, the committee "found no literalness of the Apostle's injunctions to our own time and to all parts of our own world, would be to renounce alike our inalienable responsibility of judgment and the liberty wherewith Christ has made us free." The bishops went on to lay down the conditions for the constitutional restoration of the ancient Order of Deaconesses. For some sixty years past there have been Anglican deaconesses, but save in the United States, where they are formally recognized, they have derived their
authority less from the several Churches of that Communion than from individual bishops. Upon her ordination a deaconess will acquire Holy Orders, conferred according to a "form and manner, such as might fitly be included in the Ordinal." The function of deaconesses are defined as:—(a) To prepare candidates for Baptism and Confirmation. (b) To assist at the administration of Holy Baptism, and to be the administrant of that Sacrament in cases of necessity in virtue of her office. (c) To pray with and to give counsel to such women as desire help in difficulties and perplexities. (d) With the approval of the bishops and of the parish priest, and under such conditions as shall from time to time be laid down by the bishop (i.) in church to read Morning and Evening Prayer and the Litany except such portions as are assigned to the priest only; (ii.) in church also to lead in prayer and, under licence of the bishop, take a real share in the administration of such offices as the order of the Church may lay down. (2) Grave concern is expressed at "the spread in modern society of theories and practices hostile to the family," such as the use of unnatural means for the avoidance of conception. In regard to venereal disease, the conference must condemn the distribution of or use, before exposure to infection, of so-called prophylactics, since these cannot be regarded as an invitation to vice.  "It should, however, be pointed out that Clause (d) (ii.) was passed by a majority only. Women other than deaconesses should have opportunity given them, with the bishop's permission, to speak and lead in prayer both in consecrated and unconsecrated buildings at other than the regular and appointed services of the Church, on the same conditions as men.

Spiritualism, Christian Science, and Theosophy.—The conference saw "grave dangers in the tendency to make a religion of Spiritualism," the practice of which as a cult "involves the subordination of the intelligence and the will to unknown forces or personalities." The teaching of Christian Science "cannot be reconciled with the fundamental truths of the Christian faith and the teaching of Scripture," since it tends to Pantheistic doctrine, to a false antithesis between spirit and matter, and to the denial of the reality of sin, disease and suffering. The conference declared that in the positive teaching of Theosophy there are cardinal elements irreconcilable with the faith.

Marriage and Sexual Morality.—"The conference affirms as our Lord's principle and standard of marriage a life-long and indissoluble union, for better for worse, of one man with one woman, to the exclusion of all others on either side, and calls on all Christian people to maintain and bear witness to this standard. Nevertheless, the conference admits the right of a national or regional Church within our Communion to deal with cases which fall within the exception mentioned in the record of our Lord's words in St. Matthew's Gospel, under provisions which such Church may lay down."  "Grave concern" is expressed at "the spread in modern society of theories and practices hostile to the family," such as the use of unnatural means for the avoidance of conception. In regard to venereal disease, the conference must condemn the distribution of or use, before exposure to infection, of so-called prophylactics, since these cannot be regarded as an invitation to vice.  "It should, however, be pointed out that Clause (d) (ii.) was passed by a majority only. Women other than deaconesses should have opportunity given them, with the bishop's permission, to speak and lead in prayer both in consecrated and unconsecrated buildings at other than the regular and appointed services of the Church, on the same conditions as men.

The Church and Industrial Questions.—"An outstanding and pressing duty of the Church is to convince its members of the necessity of nothing less than a fundamental change in the spirit and working of our economic life. This change can only be effected by accepting as the basis of industrial relations the principle of cooperation in service for the common good in place of unrestricted competition for private or sectional advantage."

Christianity and International Relations.—"Stress was laid upon the importance of endeavouring to increase international comity and good-will, and of securing their expression by an increased recognition of international law and custom. Steps should immediately be taken to enable the whole Church of Christ to urge upon the peoples of the world the principles of the League of Nations. "We hold that the peace of the world, no less than Christian principle, demands the admission of Germany and other nations into the League of Nations at the earliest moment which the conditions render possible."

Missionary Problems.—"It was urged by the conference that missionary societies and boards should make their work centre in the Church rather than in the mission organization by the establishment of councils and diocesan boards, which should have a real share in financial control and general direction. Liturgical uniformity should not be regarded as a necessity everywhere, i.e. the Prayer Book, as the one fixed liturgical model, is inapplicable in many parts of the mission field. It is sufficient that local liturgical forms should retain "those features which are essential to the safeguarding of the unity of the Anglican Communion."

Development of Provinces.—The gradual creation of new ecclesiastical provinces should be encouraged, and each newly-founded diocese should as soon as possible become a constituent member of a province. In the opinion of the conference four is the minimum number of dioceses to form a province, but no number is too great so long as convenience of consultation is assured. Newly-constituted provinces should have some distinct voice in the elections of their metropolitans.

Self-Government of the Church.—The need of a representative body which, by including laymen, should interpret to the nation the desires of churchpeople and make clear the need for self-government with greater force than was possible to the Houses of Convocation, had been felt in the Church of England for many years. After much discussion and considerable opposition a Representative Church Council was formed in 1904 and endowed with a constitution in the following year. It consisted of the four Houses of Convocation and the two Houses of Laymen. The council, however, had no legal existence and no powers save such as were accorded to it by the good-will of churchpeople. It served a useful temporary purpose and encouraged the growing conviction that the laity were entitled to a much larger share in the councils of the Church, but its lack of authority made it an imperfect instrument, and it soon became clear that nothing short of a statutory form would satisfy the insistent claim for lessened State control. In 1913, therefore, a committee was appointed by the two archbishops "to inquire what changes are advisable in order to secure in the relations of Church and State a fuller expression of the spiritual independence of the Church as well as of the national recognition of religion." This committee unanimously reported that Parliament, owing to modern changes in its memberships, was no longer the right legislative authority for the Church, and that the time was ripe for granting to the Church wider powers of self-government, and presented a scheme for enabling statutory form to be given to four elective bodies, i.e. parochial church councils, ridural council, diocesan conferences, and a council church. As we have seen, the germ of the last named already existed in the Representative Church Council. The other three bodies were also in voluntary existence, although the number of parochial church councils was relatively small. In 1917 the scheme was accepted in principle by both Convocations, and in 1919 a further committee appointed by the Representative Church Council presented an amended plan which was passed by both Convocations. In May of that year Conferences addressed the Crown, asking that legislative authority should be conferred upon the proposed Assembly, and on Dec. 23 1919 the Church of England Assembly (Powers) Act according this authority received the Royal Assent. For this result the active propaganda conducted by the Life and Liberty Movement was largely responsible. The Assembly consists of the whole of the diocesan bishops of England (the House of Bishops), the whole of the members of the two Lower Houses of Convocation (the House of Clergy), and a number of laymen and laywomen proportioned to the size of each diocese, elected for five years by the diocesan conferences (the House of Laity). The three houses may sit together or separately. Under the Church of England Assembly (Powers) Act (commonly called the Enabling Act), the first two duties of the Assembly were to draw up a constitution for the parochial councils and to take steps for the reform of Convocation.

The Assembly, which met for the first time on June 30 1920, was empowered to legislate by means of bills (technically called Measures) which, after being passed by it, are to be sent to an ecclesiastical committee consisting of 15 members of the House of Lords, appointed by the Lord Chancellor, and 15 members of the House of Commons, appointed by the Speaker. This committee is to consider each measure, and "draft a report
throno to His Majesty, stating the nature and legal effect of the measure, and their views as to its expediency, especially with relation to the constitutional rights of all His Majesty's subjects." If the report is favourable, the Measure will go before Parliament, but will not be presented for the Royal Assent until each House has asked for it.

Parochial Church Councils.—Under the Parochial Church Councils (Powers) Measure, which received the Royal Assent in 1921, a church council is to be formed in every parish, elected by the registered parishioners or non-resident attendants at the parish church. The electors, male or female, must be 18 years of age, and have been baptized, and must subscribe a declaration that they are not members of any religious body out of communion with the Church of England. To these councils most of the powers of the churchwardens have been transferred; they will be responsible for raising and spending money for parochial purposes, and they are charged to cooperate with the incumbent in all matters concerning the welfare of the parish.

Ruridecanal Conferences.—These are elected by the parochial church meetings from their own members. In most cases they elect the members of the Diocesan Conferences.

Diocesan Conferences.—In their turn the Diocesan Conferences elect the lay members of the Church Assembly in given proportions for each diocese. The form also the financial and business authority of the diocese, to which all the immovable Church property within their area must be legally transferred. To them are affiliated the Boards of Finance which are to act as the collecting and spending authorities of the dioceses.

Reform of Convocation.—In Nov. 1920, the Church Assembly performed its first legislative act by passing a Measure declaring that the Convocations have power, with the Royal Assent, to make canons for the amendment of their constitution. This assent having been given, the Convocations, in Feb. 1921, drew up new constitutions which made the following provisions: The Upper Houses will consist, as now, of all the English diocesan bishops; the Lower Houses will consist of all the deans, including those of Westminster and St. George's, Windsor, the two senior archdeacons in each diocese, one proctor for every hundred electors, with one more for every incomplete hundred not being less than fifty; the electors will be all clergy men benefited in the diocese, or possessing the bishop's licence, or holding office in a cathedral or collegiate church; all clergy men in priest's orders will be eligible for election as proctors; the voting is to be on the lines of proportional representation.

Prayer Book Revision.—The revision of the Prayer Book authorized by the Royal Letters of Business first issued in 1906, and since renewed, to the two Convocations enjoining them to consider "the desirability and the form and contents of a new rubric regulating the vesture of the ministers of the Church at the times of their ministrations, and also of any modification of the existing law relating to the conduct of divine service, and to the ornaments and fittings of churches," had in 1920 been completed subject to the assent of the National Assembly of the Church. The proceedings were necessarily slow and complicated, since each of the four Houses of Convocation had to debate every proposal in detail. Many of the emendations were merely verbal; others raised questions the most sharply controverted between sections of opinion in the Church.

The Athanasian Creed.—One of the sharpest controversies raged around the Athanasian Creed, of which a new translation, prepared at the request of the Archbishop of Canterbury, was published in 1917. After prolonged discussion it has been decided by both Convocations that the Creed shall be retained in the Prayer Book, without the existing rubric, and with a new rubric prescribing that on Trinity Sunday it may be said in place of the Apostles' Creed.

The Holy Communion.—The revision permits the priest to celebrate in a surplice or in "a white alb plain with a vestment or cope." He is to say the service in a "distinct and audible voice." The Commandments are shortened: the tenth reads simply "Thou shalt not covet." They may be omitted altogether at a given service provided that they are said once every Sunday. The collects for the king are omitted; the reader of the Epistle and Gospel is to turn towards the people; the sermon is permissive ceremonial mixing of the changes is permitted; in the Exhortation the words "eat and drink our own damnation" are corrected to "eat and drink judgment unto ourselves." An altered Proper Preface is provided for Whitsuntide and several new Proper Prefaces are inserted. In the Canterbury revision only the Canon is rearranged, the Prayer of Humble Access following immediately after the Comfortable Words, and the Lord's Prayer following the Prayer of Consecration. The latter is lengthened by the addition of thanksgiving and prayer. Of the Prayers of Oblation and Thanksgiving, one or both may be said. The words of Administration may be said once "to a whole number of communicants, either the first or the second half of the words being recited to the individual, or the whole words may be said once to each ruffian of communicants instead of saying them to each separately. A declaration is added to the effect that the Order of Holy Communion ought not to be diminished or added to, "nor should the private devotions of the minister be such as to hinder, interrupt, or alter the course of the service." The Convocation of York concurs in these emendations, with the exception of the amended Canon.

The Psalter and the Lectionary.—In the main the revision of the Prayer Book Psalter has consisted of the emendation of unintelligible, misleading or obscure phrases, archaic punctuation, and the discarding of words which have changed their meaning or fallen into disuse, such, for instance, as "leasing" for which "lying" is substituted. As regards the recitation of the Psalter, Psalms are appointed for every Sunday in the year and for certain Holy Days. Otherwise the Psalms, with a few omissions, will be read through in order once a month. Psalms have also been selected for use on various occasions instead of those for the day, but others may be substituted with the approval of the bishop. Certain Psalms and portions of others are discarded altogether from public reading. Coming to the Lectionary, we find that alternative first and second Lessons have been provided for Sundays. To make it possible for congregations to hear selections from the less familiar parts of the Old Testament and from some Books of the Apocrypha, alternatives have been chosen to the Lessons taken from the Pentateuch, the Historical Books, and the Book of Proverbs. Two series of Second Lessons have been provided, one from the Gospels and the other from the Acts, the Epistles, or the Book of Revelation. The First Lessons for week-days follow a coherent plan—the principle of the arrangement of the Second week-day Lessons is that when a Lesson from the Gospels is read at Matins, one from the Acts, Epistles, or Revelation should be read at Evensong, or vice versa. Special Lessons have been provided for Holy Week, Easter Week, Rogation Days, Whitsun Week, Holy Days, and Dec. 29, 30 and 31. It is recommended that Lessons should be prefaced by a brief Introduction.

The New Calendar.—A new calendar has been prepared, to which have been added, among others, Saints Polycarp, John Chrysostom, Thomas Aquinas, Patrick, Cuthbert of Lindisfarne, Leo the Great, Anselm, Catherine of Siena, Athanasius, Basil, Bernard of Clairvaux, Aidan, Ninian, Francis of Assisi, and Gennadius of Alexandria. All Souls' Day is added, and the Saints, Doctors and Martyrs of the Church on Nov. 8.

Other Provisions.—Alternative Epistles and Gospels are provided for Christmas Day and Easter Day, and collects for St. Mary Magdalene, the Transfiguration, the Nativity of the Blessed Virgin Mary, All Saints' Day, Harvest Thanksgiving and Saints' Days in the Calendar not otherwise provided for. In the Exhortation in the Marriage Service the second of the causes for which matrimony was ordained now reads "that the natural instincts and affections, implanted by God, should be hallowed and controlled." In the Lesson in the Burial Service (Luke xvi. 27-31) difficult is omitted and an alternative Lesson is provided from 2 Cor. iv. 16-11, "Though our outward man, etc." In the Ordinal an important alteration has been made in the Questions to Deacons as to their belief in
Holy Scripture. It now runs: "Do you unfeignedly believe all the Canonical Scriptures of the Old and New Testaments as given of God to convey to us in many parts and in divers manners the Revelation of Himself which is fulfilled in our Lord Jesus Christ?"

The Scottish Revision.—The Church in Scotland has also revised its Prayer Book, and a tentative revision is now in use. In 1910 the Episcopal Synod prepared a revised Scottish Communion Service, and a similar proposal was made by the Consultative Council on Church Legislation prepared a schedule of permissive additions to and deviations from the Book of Common Prayer. The new and revised forms were finally sanctioned and came into operation in a permissive form in 1912. In the Communion Office, according to both the Scottish and the English rite, either of which may be used in Scotland, the Commandments may be omitted and replaced by Our Lord's Summary of the Law. The collects for the king may also be omitted. When there are many communicants the words of administration may be said once, the first half of the words only being recited to each person. The mixed Lectionary which gives the sick are authorized by rubric. New Proper Prefaces have been provided for festivals which hitherto lacked them and new collects, Epistles and Gospels for marriages, funerals and other special occasions and for certain festivals. There is now power, with the bishop's consent, to omit the Litany altogether on the three great festivals. Certain portions may be omitted at other times; new sacrifories have, however, been added for the king's forces, for missions, and for Parliament. A variety of additional prayers have been added, together with commemorations of the dead. In the Marriage Service the exhortation has been altered and abbreviated, and there are alternative Lessons in the Burial Service. In the Confirmation Service the sign of the cross may be used. Considerable difficulty was experienced in preparing a revised Psalter which should be generally acceptable, but in 1915 a committee appointed by the Scottish bishops produced a new distribution of the Psalms, which is now in permissive use. Its distinctive feature is the provision of separate Sunday and week-day courses. The Sunday course allows the recitation of the whole, with the exception of some of the minatory Psalms, once a year; the week-day cycle is completed every 28 days. A new Lectionary which substitutes Proper Lessons for the eve of festivals and other special occasions, and makes larger use of the Apocrypha, was adopted in 1918. A committee appointed in 1918 by the Consultative Council on Church Legislation to consider further revision of the Prayer Book reported in June 1921, and the Council agreed that a complete new Scottish Prayer Book should be published.

Church Reunion.—The movement which rendered possible the "Appeal" put forth by the Lambeth Conference began definitely in 1910 when the General Convention of the American Episcopal Church resolved unanimously to invite the Christian Communions all over the world to hold a World Conference "for the consideration of questions touching Faith and Order." The World War seriously delayed progress, though much was done to clear the ground. A committee representing the Church of England and the Free Churches produced two interim reports containing a statement of agreement on matters of faith, and a similar statement regarding order, the latter of which accepted the Sacraments of Baptism and the Lord's Supper and recognized that there had been conferred upon "the whole Church" "a ministry of manifold gifts and functions. The questions upon which differences still remained in 1921 were how far the Church of England was prepared and the remedies to be applied and proposed in the case of Anglican creed, and worship, the conditions, objective and subjective, in the ministration of the Sacraments upon which their validity depends, and whether the ministry derives its authority through an episcopal or a presbyteral succession, or through the community of believers, or by a combination of them. The second interim report recognized that continuity with the historic episcopate should be preserved, but that the episcopate ought to resume a constitutional form. The acceptance of the fact only of episcopacy should be expected, theories as to its character being set aside. "The acceptance of episcopacy on these terms should not involve any Christian community in the necessity of disowning its past, but should enable all to witness and influence as heirs and trustees of types of Christian thought, life, and order not only of value to themselves, but to the Church as a whole." A meeting preliminary to the Conference was held at Geneva in Aug. 1920 at which 40 countries and 70 religious communities were represented, and a Continental Committee was appointed to make further preparations for the World Conference on Faith and Order. The date of the Conference had not been fixed in June 1921, but the Patriarch of Jerusalem had invited it to meet in the Holy City. Meanwhile there was much domestic discussion on the subject of reunion. The propriety of the exchange of pulpits between ministers of the Church of England and of the Free Churches was hotly debated, but such exchanges were frequently taking place. The most remarkable instances occurred when a Baptist minister preached in Canterbury cathedral on the occasion of a war anniversary, and Dr. Jowett (Congregationalist) preached in Durham cathedral, in each case at the invitation of the dean. In 1919 the Bishop of London formulated a scheme for reunion with the Wesleyan Methodists, the main features of which were that the Wesleyan Church should be a society within the Church; that a certain number of presidents and superintendents should be consecrated bishops, and that ordinations in each Church should be in a form which would satisfy the other. No practical result has yet followed. A conference of Churchmen and Nonconformists at Mansfield College, Oxford, resolved in favour of interchange of pulpits, mutual admission to the Holy Communion, and "acceptance by ministers, serving in any one denomination, who may desire it, of such authorization as shall enable them to minister fully and freely in the churches of other denominations." The Federal Council of the Evangelical Free Churches has expressed a desire to discuss with representatives of the Anglican Communion the proposals of the Lambeth Conference for the avoidance of misunderstandings. Reform of Church Finance.—The chaotic condition of the finances of the Church of England, the overlapping and waste of effort resulting from innumerable more or less isolated endeavours to accomplish a given end, the existence of many societies with aims and policies of their own, led in 1909 to the appointment of the Archbishops' Committee on Church Finance. After more than two years' inquiry and deliberation this Committee reported in 1913, and its recommendations were subsequently carried into effect. The keynote of the report was the recommendation that the diocese and not the parish should be the unit of Church life and that responsibility for the work of the Church should be brought home to every member. There is now a Board of Finance in every diocese elected by and affiliated to the Diocesan Conference. These boards arrange a system for the assessment of every parish according to its means and population. There is a Central Incorporated Board of Finance, a Committee of Maintenance of the Clergy and a Central Advisory Council on Training for the Ministry. These general provisions include arrangements present or prospective for recruiting and training ordination candidates who are unable in whole or in part to provide the cost of their own education; for maintaining the ministry by the endowment and augmentation of benefices, etc.; for the provision of clergy pensions; for providing for the widows and children of the clergy and making grants to clergy in difficulties through misfortune; for the erection of new churches and other parochial buildings. The most noteworthy result is that the Church of England now possesses, for the first time in its history, a legal corporate existence. A bequest of money to "The Church of England" is now valid and effective; previous to these important arrangements it would have been void, since under English law no one was entitled to give a receipt on behalf of the Church as a corporate body. So soon as it was in working order (in the autumn of 1913) the Central Board of Finance began an attempt to raise a central fund of £5,000,000 for the maintenance of the clergy.
the education of ordination candidates, training colleges and other Church purposes. In 1919 a sum of £120,000 was allocated to the pecuniary assistance of the clergy, but in 1920 only £30,000 was available for this purpose, the progress of the central fund having been disappointingly slow; most, if not all, of the dioceses have failed to raise their quotas. The Board has established an Ordination Test School at Knutsford, for testing the vocation of candidates for the ministry who have served in the war, and down to the end of 1920 about 700 men were placed there, while a somewhat similar number were provided to go to the universities and theological colleges. The school was in 1921 being used mainly for civilian candidates. The Central Board of Finance, whose methods have been seriously criticised, is henceforward to be responsible to the Church Assembly.

Welsh Church Commission.—The Royal Commission appointed in 1906 to "inquire into the origin, nature, amount and application of the temporalities, endowments and other properties of the Church of England in Wales and Monmouthshire, and into the provision made and work done by the Churches of all denominations in Wales and Monmouthshire for the spiritual welfare of the people and the extent to which the people avail themselves of such provision," did not report until Dec. 1910. The statistics presented on behalf of the Church showed that the actual number of communions made at Easter rose from 134,000 in 1905-6 to 144,000 in 1908-9, and that the total number of persons upon all the Welsh communicants was, in the latter year, 193,000. These returns were based upon lists for each parish, with the name and address of each communicant. The Nonconformist lists of "full members" gave the Congregationalists 175,000, the Calvinistic Methodists 170,000, the Baptists 143,000, the Wesleyans 40,000 and the smaller Protestant denominations 10,000 among them. Other figures prepared on behalf of the Church showed that in every diocese in Wales there had for many years past been a constant and substantial increase in infant baptisms, confirmations, and Sunday-school scholars, and that in most cases the numbers had grown in a larger proportion than the population, the inference being that the Church was expanding by conversions from Nonconformity. The Commission found that the Church in Wales provided 1,546 churches and mission rooms, with seating accommodation for 458,917. The officiating clergy numbered 1,507—668 incumbents, 361 curates and 68 others. The seating accommodated by the Church was equal to 15 per cent. of the population. The accommodation in the Nonconformists' places of worship provided for more than double the total of Nonconformist adherents; the chapel-building debt of the Calvinistic Methodists amounted in 1906 to £668,000, and of the Congregationalists to £318,000. On the other hand the Anglican Church accommodation failed to keep pace with the increase of the population. Resident clergy, however, grew by 11½ per cent. and regular Sunday services by 1½ per cent. Much controversy arose as to the accuracy of the figures presented on the one side or the other, but in the end it appeared to be clear that the Church of England was numerically the largest single religious body in Wales. The Commission found the total gross endowments of benefits in Wales in 1906 to be £2,424,666. (A Parliamentary report issued in Nov. 1912 showed it to be then £2,666,937.) Of this sum £135,980 is income of endowments believed to have been in existence in 1703; £37,344 is income derived from Queen Anne's Bounty; £49,669 is income derived from the Ecclesiastical Commissioners; £19,672 comes from private gifts since 1703.

Welsh Disestablishment.—Before the Commission could report the Government in 1909 brought in a bill for the disestablishment and disendowment of the Church in the four Welsh dioceses and the county of Monmouth; generally similar in its provisions to the bill of 1895, but withdrew it after the first reading. The date after which private benefactions were to be exempt from the operation of the Measure was fixed at 1662, instead of 1703, as in the former bills. In April 1912 a fresh disestablishment and disendowment bill was introduced which admittedly took away 13½ ad. in the £ of the endowments. The measure, after numerous alterations and amendments, and after being twice rejected by the House of Lords, received the Royal Assent, under the Parliament Act, in Sept. 1914. Coincidently with it a Suspensory Act was passed, postponing its operation as regards disestablishment, but not disendowment, for 12 months, or until the conclusion of the World War, whichever should be the longer period; by a subsequent Order in Council the date of disestablishment was postponed until the end of the war. Under the Established Church (Wales) Act, the vested interests of incumbents were preserved for their lives. Welsh Church Commissioners were appointed to whom were transferred all property belonging to the Church in Wales which was vested in the Ecclesiastical Commissioners and Queen Anne's Bounty; the property left to the Church was transferred to a Representative Body, appointed by the Welsh Church. The property so allocated included the churches and parsonages, a proportion of the value of the glebes, private benefactions since 1662, and all the movables contained in the churches. The tithe rent charges and other property of which the Church was deprived went to the Welsh County Councils and the university of Wales. The Act was modified by the Welsh Church (Temporalities) Act passed in 1915. Under this measure a sum of £1,000,000 was granted by Parliament to the Church in Wales, mainly as compensation for the increased value of tithe since the passing of the principal Act, and the date of disestablishment was finally fixed as March 31 1920. The Parliamentary history of this legislation is dealt with elsewhere.

Constitution of the Church in Wales.—The constitution of the disestablished Church was drafted by a Convention consisting of representatives of each of the four Welsh dioceses. This Convention decided that the Church should be called "the Church in Wales," and that the governing body shall consist of the diocesan bishops and their suffragans or assistant bishops, the dean and archdeacons, 25 elected clergy and 25 elected laymen from each diocese, together with 12 coopted women. The governing body is to maintain the Articles, doctrines, rites and formularies of the Book of Common Prayer, subject to subsequent modification. New canons may be made by a two-thirds majority of the diocesan bishops, clergy and laity. The Representative Body consists of the diocesan bishops, four clergymen and eight laymen from each diocese, 12 coopted members and eight nominated by the bishops; subject to the assent of the governing body, 12 women may be added. The Representative Body shall consist of the bishops, representatives of the dioceses, and representatives of the diocesan churches under the orders of the governing body. The bishops are to be elected by a board of 33 electors, consisting of the remaining bishops, six clerical and six lay representatives of the vacant diocese, and three clerical and three lay representatives of the other dioceses. The election must be by a two-thirds majority, failing which the appointment is to be made by the Archbishop of Canterbury. Presentations to livings are to be made by Diocesan Patronage Boards, but every third appointment is reserved to the bishop. Benefices are held for life, subject to the right of the governing body to divide or rearrange parishes, to the right of the bishop, with the consent of the patronnage board, to remove an incumbent to another living of equal or greater value, and to the right of the Supreme Tribunal to deprive an incumbent whose conduct "grievously hinders" the welfare of the Church. In case of such removal reasonable provision is to be made for the maintenance of the priest so removed. On April 1 1920, a week after disestablishment became effective, a Province of Wales was constituted and the Bishop of St. Asaph (Dr. Edwards), was elected Archbishop of Wales; but it was anticipated that ultimately the Primacy would be attached to the See of St. David's. The new archbishop was enthroned by the Archbishop of Canterbury in St. Asaph cathedral on June 1 1920. It is intended, so soon as circumstances permit, to divide the dioceses of St. David's and Llandaff. A fund of £1,000,000 was started for reallocation; rather more than half the required amount had been obtained by June 1921.

The Kilmarnock Conference.—In 1913 an event occurred which for a time threatened serious consequences to the unity of the Church and caused much excited and angry feeling. In June
of that year 60 missionaries, representing the different missionary societies working in British East Africa, met at the Church of Scotland station at Kikuyu, on the Uganda railway, to discuss the possibility of a federation between the Christian bodies working in that region. Among those present were the Bishop of Uganda, who presided, and the Bishop of Mombasa; representatives of the Church of Scotland; the (American) Africa Inland Mission; the Friends' Industrial Mission; the United Methodist; the Lutheran Mission, and the Seventh-Day Adventists. The Conference adopted a "constitution" the preamble of which declared that "with a view to ultimate union of the native Churches, a federation of missionary societies should be formed." The "constitution" settled the following basis of federation: "The loyal acceptance of the Holy Scriptures as our supreme rule of faith and practice; of the Apostles' and NiceneCreeds as a general expression of fundamental Christian belief, and in particular belief in the absolute authority of Holy Scripture as the Word of God, in the Deity of Jesus Christ, and in the atoning death of our Lord as the ground of our forgiveness; recognition of common membership between the Churches in the federation; regular administration of the two Sacraments, Baptism and the Lord's Supper, by outward signs; a common form of Church organization." At the end of the conference there was a corporate Communion celebrated by the Bishop of Mombasa, in which the whole of the delegates participated. The inevitable storm speedily broke. In Nov. the Bishop of Zanzibar published an open letter to the Bishop of St. Albans entitled "Ecclesia Anglicana: what does she stand for?" in which, declaring that "there has not been a conference of such importance to the life of the Ecclesia Anglicana since the Reformation," he charged the Bishops of Mombasa and Uganda with heresy, and asked for the judgment of his fellow bishops of the Province of Canterbury upon what had happened. The Bishop of Uganda immediately replied, defending his action and explaining that the corporate Communion was an exceptional incident standing apart from any general scheme of federation. After further controversy the Archbishop of Canterbury, having refused to take proceedings for heresy and schism against the incriminated bishops, referred the subject to the Central Consultative Body of the Lambeth Conference, which consisted of 14 bishops representing various parts of the Anglican Communion. The following year they got the whole General Synod of the Church of England assembled, which actually consisted of the Archbishops of York, Armagh, the West Indies, Rupert's Land, and the Primus of Scotland, the Bishops of Winchester, Exeter and Gibraltar, Bishops Copleston, Wallis, and Ryle:—

"Ministers recognized in their own bodies may be welcomed as visitors to preach in Anglican churches provided they are accredited by the Diocesan Bishop. 2. Non-Anglicans may be admitted to the Holy Communion at the discretion of the Diocesan Bishops, on condition of the acceptance of the Apostles' and NiceneCreeds, the absolute authority of Scripture as the Word of God, and the Deity of our Lord. 3. Anglicans must not receive the Holy Communion from ministers not episcopally ordained or whose orders are otherwise irregular."

With reference to the corporate Communion, the Consultative Body, while recognizing that it was an abnormal and spontaneous act of devotion, added that "any attempt to treat it as a precedent, or to encourage habitual action of the kind, must be held to be inconsistent with principles accepted by the Church of England. . . . So far from promoting unity it would, in our judgment, rather imperil the measure of unity which we imagine the primitive Churches in the federation; regular administration of the two Sacraments, Baptism and the Lord's Supper, by outward signs; a common form of Church organization."
currency of the Tithe Act of 1918, to the amount payable in that year, with the proviso that where a benefice does not exceed £300 in value, the landlord is to be repaid one-half the rate only, which is usually called the "tithe rent charge." Since the Act of 1918 sales of ecclesiastical tithe rent charge have greatly increased; it may be added that, in consequence of the imposed rate, many of the rural areas have been left with a large number of sales of glebes, to the substantial enhancement of the value of many benefices. A movement has been set on foot for relieving clergy of the Church of England from the statutory disability of sitting in the House of Commons on the ground of their clerical status. The same object passed its second reading in the Lords in 1919 but in Committee the relief as regards Parliament was struck out. It was reintroduced in 1920 by Sir John Hope-Crawford. The present Union of Benefices Act, limited in its duration to Dec. 31, 1921, enabling the Ecclesiastical Commissioners, with the concurrence of the bishop of the diocese, to prepare after public enquiry schemes for the diminution of the number of churches, was passed. These unions became effective by Order in Council.

**Doctrinal, Discipline and Ritual.**—During the decade several important events affecting the doctrine and discipline of the Church of England occurred. The first turn under the interpretation of the Deceased Wife's Sister Marriage Act of 1907, and led to the suit of Banister v. Thompson. The plaintiff married his sister-in-law in Canada, where he had no domicile, under the Colonial Act, before the passing of the English Act, and was refused communion by his vicar, the defendant. The Court of Arches found in 1908 that the passing of the Act of 1907 validated the marriage as a civil contract, and the parties consequently could not be "in evil lives," to use the language of the rubric which the defendant held to justify his refusal. The High Court, by a majority, upheld this decision, which was endorsed by the Court of Appeal and confirmed by the House of Lords in 1910. In the same year Thompson, Fellow and Tutor of Magdalen College, Oxford, published *Miracles in the New Testament*, which produced an animated controversy. In the result the Bishop of Winchester, as visitor of the College, rescinded the appointment which he had made at the request of the then rector, who was, and continued to be, dean of divinity, on the ground that the book denied the articles of the Creed affirming the Incarnation and the Holy Trinity. There has been much discussion on the propriety of permitting Reservation of the Eucharist, and in 1917 the Upper House of Canterbury Convocation reaffirmed the draft rubric on the subject which it is proposed to insert in the revised *Book of Common Prayer*. The permission provides that if the consecrated elements are not taken immediately to the sick person "they shall be kept in such place and after such manner as the Ordinary shall approve, so that they be not used for any other purpose whatsoever," the object being to prevent the spread of organized devotions before, or in the presence of, the Sacrament. In 1919 and 1920 an acute controversy arose upon the adoption of the service of Benediction in a few churches, and two clergymen were deprived of their livings for persistence in celebrating this rite—the Rev. L. S. Wason, perpetual curate of Cury-with-Gunwaloe, in Cornwall, and the Rev. R. W. Wynter, vicar of St. John the Baptist, Hackney, in London. The former was shortly afterwards received into the Church of Rome. In 1918, the Bishop of Manchester (Dr. Knox) refused to institute the Rev. C. S. Carey to the living of Sacred Trinity, Salford, on the ground that the Bishop of London had refused to approve of the candidate wearing Eucharistic vestments, using incense ceremonially, and lighting candles when not required for giving light. The case went to the High Court, and Mr. Justice Paris, dissatisfied with the judgment in the bishop, on the ground that three of the four practices are illegal. An appeal was not pressed, the patron having agreed to accept another presbyter.

**Service of Church Buildings.**—Doubts having been expressed as to the efficiency of the supervision by the Church of the ancient monuments under her care, a committee was appointed in 1912, under the auspices of the Dean of the Arches, which reported favourably upon the supervision of ecclesiastical buildings in general. Attention that more attention might sometimes be given to aesthetic considerations. Recommendations in the direction of better supervision of works of restoration were made, and a number of disgraces were pointed out. In 1917 the Ancient Monuments Act was passed which created boards for England, Scotland, and Wales to advise the Commissioners of Works upon the repair of ancient buildings. In 1921 a committee was appointed to consider the advisability of strengthening the Act and including in its scope churches and other ecclesiastical buildings still in use. Shortly afterwards the House of Lords passed a motion condemning the conduct of the Government in the matter of this "withering" attack on the Church authorities and without some proof that the provisions for the protection of cathedrals and churches which have prevailed for centuries have proved inadequate. Shortly before a committee appointed by the Metropolitan Board of Works had reported that 19 of the City churches should be removed, as being redundant. A great outcry followed, and in the end the Bishop of London undertook to save the monuments without the concurrence of the National Assembly. The subject was kept prominently before the public by the necessity, revealed at the end of the war, for extensive and costly repairs to several of the most famous ecclesiastical monuments in England, notably Westminster Abbey, which will cost £200,000, the Savoy Palace, at £50,000, and the Palace of St. George's Chapel, Windsor, the choir of which was found to be dangerously unsafe. St. Paul's cathedral has also given great anxiety. The pressure of the dome upon the piers caused them to give signs of change, and they were strengthened, and strengthening them has been proceeding slowly and at great cost.

**Canada.**—During 1910-21 there was great activity in the Church of Canada in consequence of the enormous influx of English settlers, and in 1918 the latest round of the revision of the *Book of Common Prayer* was completed. The Church in what is now the dominion was held at Annapolis Royal in 1710, and the bicentenary was marked by the opening of a new cathedral at Ottawa. In 1914 the Bishops of Ottawa and St. Albans, and the Union of Benefices Fund was established in 1910 for the provision of men and money to meet these needs, and the Rev. W. J. Brooks was appointed secretary and treasurer. A committee of laymen was chosen, and among the donations, out at once with five clergy and four laymen, who worked on the Bush Brotherhood system, and were afterwards joined by many others. By the time the fund, which was always intended to be of limited duration, came to an end, not only had it made possible the connexion with the Edmonton, Alberta, and Railway Missions. In 1912 a mission of help was sent to the Province of Rupert's Land. In 1911 British Columbia was erected into a province and in 1912 it was decided that instead of one province for the whole of Canada E. of Manitoba, a new ecclesiastical province of Ontario should be formed to include the dioceses of Ottawa, Algoma, Huron, Niagara, and Ontario, twenty-one churches and towns, and a fourth province in British Columbia. In 1913 the archdeaconry of Edmonton was constituted a diocese, and in the same year it was decided to form a diocese of Brandon out of that of Rupert's Land; this see has not yet become a legal fact. In 1916 the dioceses of Edmonton and Saskatchewan were formed by dividing the diocese of Saskatchewan. A new Canadian Prayer Book was adopted in 1918.

**Australia and New Zealand.**—In Australia the "Question of the Morning Prayer," which in 1912 is still pending. Distinguished counsel have stated their opinion that the Church in Australia is an integral part of the Church of, and in, England, and that it is bound by the *Act of Uniformity* in all things affecting the form of worship. The move is still in existence to which the Archbishop of Sydney refused to institute any clergyman who declined to give an undertaking not to use, or allow to be used, "the chasuble or other vestment in any church under his charge until, in the judgment of the Archbishop of Sydney for the time being, they have become legal." In each case this requirement caused a long delay in making an appointment, and the incident produced a serious division of opinion in the diocese. The first portion of Brisbane cathedral was consecrated in 1910. In 1914 the diocese of Melbourne was also consecrated. By the Act of 1912 Australia was divided into provinces, the Bishop of Perth becoming archbishop and metropolitan. Two other new dioceses have been formed in Australia—Willocha and Grafton—both in 1914, the latter taken out of the diocese of Argyll. A mission of help was sent from England to New Zealand in 1911.

**India.**—The centenary of the Indian Episcopate was celebrated in 1912, and Bishop James Foster, W. R. Robson, of Bombay, on May 14 1914 first Bishop of Calcutta, a see which originally included also Australia, New Zealand, Mauritius, and Cape Colony. In 1915 a bishopric of Assam, cut away from the Metropolitical Diocese of Calcutta, was formed, and in 1912 a native priest was, for the first time, raised to the Episcopate, the Rev. V. S. Azariah being appointed Bishop of the new see of Dornakal, in Hyderabad State. In 1913 the bishops decided that the time had come for the introduction of the English prayer book in the Indian Church. Proposals were made opposed to the practicality of the change, and it was consequently decided that a provincial council, consisting of bishops, clergy and laity, would be formed for the purpose. The Bishop of the Episcopal Synod. Diocesan councils are also to be erected, and a beginning has been made in that direction. In consequence of the intended removal of the capital to Delhi, the Provincial Synod of Bengal was held in Calcutta. In 1913 the Synod of India authorized the Archbishop and the Primate of the Anglicans to include the see of Madras, Tinnevelly, Trivancore, Colombo and Dornakal; and another of Delhi, to include Lahore, Lucknow, Calcutta, and Madras. The Synod of the Episcopalians, whose education has been greatly neglected in the past. Roman Catholic and Nonconformist schools have provided for large numbers, and in 1914 the National Education Act provided for the provision of special funds are being raised for improving and strengthening the Anglican schools in the great centres of population.

**Africa.**—Two new dioceses have been formed in South Africa— Cape Town and Port Elizabeth—by the Act of 1911. In 1911 Kimberley and Kuruman, taken out of the diocese of Bloemfontein (1912). In 1915 the diocese of Mashonaland was reconstituted...
The Church and the Civil Power.—Several interesting questions in the relations of the Church to the civil power were put to the test of practical working.

In France the friction between the Vatican and the French Republic had resulted in 1905 in the separation of Church and State and the rupture of diplomatic relations. It had followed upon the refusal of Pius X. to permit the effective intervention of the French Government in the trial and removal of two French bishops in a matter of purely ecclesiastical discipline. The bill to secure the possession of Church property and to withdraw the subsidy for the clergy. It placed the upkeep of the Church in the hands of voluntary parochial corporations (associations cultuelles) which to a large extent would have been subject to the control and supervision of the civil authority. Pius X. declared the refusal of the Church to accept such conditions, and the French bishops, as a body, although menaced with the loss of their incomes, their dwellings, seminaries, and funds vested for religious and charitable purposes, supported the Pope in his refusal. A compromise, which would have turned the associations cultuelles into ecclesiastical federations, was proposed and would, it is said, have found favour with a large number of the bishops, as apparently safeguarding sufficiently the liberty of the Church, but when the Holy See affirmed the safeguards to be inadequate, and declined to sanction it, the French episcopate unanimously accepted its decision, and affirmed its readiness to face any sacrifice rather than that of Church freedom and unity.

During the fifteen years before 1920 the Church in France had to maintain itself upon the voluntary offerings of the faithful, and the result of the experiment may be said to be that, as a result of the war, much money and difficulties, it had entered upon a new era of vigour and freedom. The State no longer presents to the bishopships, and the Holy See is free to select and appoint bishops of its own choice in consultation with the bishops of the province. In fact, just as the Concordats with Francis I. in 1516 and Napoleon I. in 1801 practically superseded or abolished episcopal capitular election, and substituted nomination or presentation by the head of the State, leaving institution or effective appointment to the Pope, so now the abolition of the Concordat has led to the adoption of what may be called the List system, which is in fact the substitution of the correspondence of the selection, its attitude to the civil State, especially from the outset of the World War, has been in many ways more friendly, based on the higher policy of the Union Sacrée, and in 1920 the French Government passed a bill for the renewal of diplomatic relations with the Pope and restored the French embassy at the Holy See, while a papal nuncio was once more to be sent to Paris.

A much more violent case of separation of Church and State was that which was effected by the revolution in Portugal.
in 1916. The revolutionary government which had deposed Dom Manuel promptly abolished the Concordat of 1778, based on the Concordat concluded between Pope Leo X. and King Emmanuel in 1516, seized the temporalities of the Church and placed them under the control of lay corporations resembling the French corporations catholiques. As any word, written or spoken in public, blaming or criticising the action of the Government, was forbidden under the severest penalties, in a short time the Patriarch of Lisbon, Mgr. Mendes de Bello, and several of the bishops were exiled, and a large number of the clergy imprisoned or deported. The Holy See, in the Encyclical Jandtudum (May 24, 1911), refused to recognize the lay corporations, forbade the clergy to accept the pensions offered by the Government, and exhorted the bishops to stand firm while waiting for better times.

The ten years preceding 1911 brought into play the wisdom of milder measures. More moderate rulers succeeded the earlier extremists, and the legislation in Portugal on ecclesiastical matters was mitigated, so that the bishops and clergy were able to return to their sees and parishes, and an arrangement acceptable both to Rome and the Government was gradually worked out, so that in 1918 diplomatic relations were resumed with the Holy See. In fact, Cardinal Gasparri, the papal Secretary of State, at a dinner given in 1920 to the Portuguese envoy, publicly expressed his congratulations on the good understanding prevailing between Portugal and the Holy See.

It would be difficult to forecast with accuracy, from such events alone, any serious change in the Church and State based on Concordats will be, in the future, compatible with the principles and programme of liberal or revolutionary governments amongst the Latin nations. That the actual separation of Church and State demanded by such governments need not necessarily mean a rupture between the two powers, and that a friendly spirit in which the rights and liberty of both are respected, would seem to be indicated by the modifications which have followed upon the revolution in Brazil since 1890. In that country the Church, after the separation, has been left fairly free in the control of its property, with possible arrangements for the subsistence of the clergy as a corporation to possess and receive bequests. In 1903 Pius X. had marked his satisfaction with the action of the Brazilian Republic by raising the Archbishop of Rio de Janeiro, Mgr. Arcovvedo de Alucucere, to the Sacred College and giving to Brazil the honour of having the first cardinal ever created in South America. The papal nuncio presided over the diplomatic commission which sat for some five years and succeeded in maintaining peace and arranging all the points of dispute between the three republics, Brazil, Peru and the Argentine. In 1918 the Senate of Brazil, by a unanimous vote, appointed a commission to congratulate Pope Benedict XV. as the beneficiary of his coronation, and to thank him for his efforts for peace during the World War. Since then, chaplains and religious services have been restored in the Brazilian navy, and notable Church progress has been made in the vast territories of the republic by the erection of new sees and the organization of missions in the Chaco and far interior.

In Serbia the great majority of the population belongs to the Eastern Orthodox Church, and before the war the number of Catholics in the kingdom was estimated at 8,000. Over these the Emperor of Austria, by the treaty of Carlovitz, exercised a protectorate which gave him considerable influence. In consequence Serbian patriotism, and became a factor of considerable political value. The Serbian Catholics were placed under the jurisdiction of the Albanian Archbishop of Scutari, and Austria was credited with the design of making use of this protectorate to promote her ambitions of eastward extension, which had the port of Scutari for its objective. To the great displeasure and annoyance of the Emperor of Austria and his Government, the Holy See in June 1914 practically crushed this scheme by abolishing the protectorate and by concluding a Concordat with Serbia which, by the inclusion of Uskub, had now a Catholic population of some 16,000 Catholics. By this Concordat the full and free exercise of their religion was guaranteed to the Serbian Catholics, and an ecclesiastical province, consisting of the archbishopric of Belgrade and the bishopric of Uskub, was recognized and endowed by the Government. The Catholic Church as a legal corporation was to have complete liberty to possess and administer her temporalities. Teachers of the Catholic catechism (who might be priests) were to have free entry into the State schools, and as long as they enjoyed the approbation of the Catholic bishops were to be paid by the Government for their services. This Concordat was ratified by Pope Benedict XV. in March 1915, and diplomatic representation has been established between Serbia and the Holy See.

A still more important step in the appreciation of the political advantages of representation at the Vatican as a centre of influence and information was taken by the British Government in 1914 by sending as its envoy to Rome the late Sir F. Trenchard, who was made Administrator Apostolic at Salis. In 1915 Holland followed the example of Great Britain and appointed a temporary representative, and in 1917 Luxembourg resumed the diplomatic relations which had been suspended under Leo XIII. In the same year the new Russian Government which came into power after the fall of the Tsar sent a minister plenipotentiary as its representative to the Holy See, and the Pope was able to procure the liberation of the Russian Bishop of Lemberg, who had been sent into exile. On learning of the arrest of the Tsar and Tsaritsa and their family Benedict XV. made earnest efforts with the Maximilian Russian Government, without success, to procure their liberation. In 1917 Archbishop Sylvester of the Russian Orthodox Church wrote to the Pope describing the cruel persecution to which he and his co-religionists were subjected, and Benedict XV. wrote to Lenin begging him to act fairly to members of all religions, but received from the Foreign Minister, Tchicherin, an evasive reply. At the same time the Letts petitioned the Pope to erect Danzig into an archbishopric, and in August 1919 the Government of the Ukraine sent an envoy to represent its interests at the Holy See.

The diplomatic activity of the Vatican during this period made itself felt in various directions. In 1917 Benedict XV. addressed a strong remonstrance to the German Government against the deportation of French and Belgian workmen, and received through Count Hettling, the Foreign Minister, an assurance that deportations would cease, and that those who were deported in error would be sent back to their homes. He obtained later on from that Power that prisoners of war suffering from consumption or similar diseases should be allowed to go to hospitals or homes in Switzerland or neutral territory. Large numbers of the prisoners thus transferred addressed to the Holy See a letter of thanks for this intervention in their favour.

In 1918 a new treaty was concluded with Spain, which went to obviate the danger of over-multiplication of monasteries. In the same year in Canada there arose a vehement agitation amongst the French-speaking Catholics against the new bilingual school laws in Ontario. The Pope dispatched to Cardinal Bevin, Archbishop of Quebec, an apostolic brief strongly exhorting all concerned to mutual peace and good-will, and giving directions as to the steps to be taken to effect a conciliation of the various parties. In the same year the Vatican received a solemn embassy and special envoy from Emperor of China, who with every expression of cordiality presented his credentials. A diplomatic mission was received at the same time from the new Chinese Republic, and a convention was concluded by the Holy See and the Chinese Government, in accordance with which the German missionaries in the Caroline and Marshall Is. were replaced by the Capucin friars, who are under French superior.

It may also be of interest to those whose studies in Church history lead them to the work of research in the Vatican archives that in July 1918, through the zeal of Cardinal Gasquet, Prefect of the Vatican Library, a friendly agreement took place between the Vatican and the Italian Government by which the latter restored to the archives a valuable document and Church records which had fallen into its possession at the occupation in 1879, and the Vatican in return handed over to the Government several documents relating to the liturgy. The Senators were also given access to the civil administration of the city and province which had been retained in its keeping. This mutual concession and the amicable way in which it was conducted showed a new spirit of conciliation between the Vatican and the Quirinal.
The Church and the “Exclusoria.”—An event which will be noted by ecclesiastical jurists and students of the relations of Church and State, the abolition of the Veto or *Exclusio*, was solemnly decreed by Pius X. in 1904, and carried out in the Concordat of 1913.

For some centuries past three Catholic powers—Austria, France, and Spain—had claimed each to have the right to intervene in the election of a Pope by excluding one cardinal from being elected to the papacy. Save that it barred the succession of someone regarded as hostile, it was legally ineffective. The veto of the civil power was restricted to one cardinal, and this exclusion usually had the result of transferring to some other cardinal of like views and temperament the votes which had been denied to his rival. It was assumed that the veto had its origin in the action of the emperors in the Middle Ages who, when they considered the elections made by the cardinals. Later and formalized, the right was held to be constitutional and required, dates only from the middle of the 17th century. Before that time the sovereigns of the nations mentioned frequently exercised influence upon the cardinals living within their dominions and urged them to form a coalition by which a given cardinal, deemed to be obnoxious, might be prevented from having the two-thirds majority required for election. In 1590 the Spanish ambassador even presented a list of cardinals who were papably acceptable to Philip II. So anxious were the powers to control the electorate, but towards the end of the 17th century it took the direct form of a communication to the Cardinal Protector of the nation concerned, on the expected removal of another cardinal, irrespective of the numbers who might be ready to vote for him. The conclave frequently took note of such representations and, as a matter of friendly dealings with the Catholic power from whom a veto might be expected, to the projects of which was likely to be invited. It is now certain, but it is held that the Holy See, while tolerating the practice, has never officially recognized this right of intervention, and has more than once warned the Sacred College to ignore it. In 1712 and in 1724 Cardinal Ruffinelli was successfully vetoed, first by Austria and then by Spain. In more recent times Austria sent its veto against Cardinal Mastai Ferretti (Pius IX.), but the envoy arrived too late, and the Pope was already elected. In 1903 the veto was held on the death of Leo XIII., in 1905 Cardinal Rampolla was on the verge of having the required number of votes when Cardinal Puzyna, to the great surprise and displeasure of the assembly, died. The result was that the conclave continued throughout the year, and when no pope was elected. This step on the part of the aged emperor is known to have been inspired and carried out by the Foreign Minister, Count Goluchowski, who had been hostile to Cardinal Rampolla when he was nuncio at Vienna. To save the Holy See from diplomatic disaster, Cardinal Rampolla, under protest, withdrew his candidacy, and his supporters, at his request, transferred their votes to Cardinal Sarto, who as Pius X. succeeded to the papacy. One of the first acts of Pius X. was to issue a solemn constitution (*Commissum Nobis*) in Jan. 1903 abolishing forever the Veto or *Exclusio*, declaring excommunicated by the fact any cardinal who in future would attempt to exercise this right and by force or by fraud and requiring from all cardinals taking part in the election of a pope oath that they will disregard all such acts of intervention on the part of the civil power. In 1914 Benedict XV. was elected under the name of Pius XI., who has disappeared as an influence in the elections to the papacy.

Organic Reform.—Next to the regulation of her relations to the civil power, and her diplomatic activities, may be considered the organic work of the Church. Both are intended to clear the field and smooth the way to spiritual efficiency and progress in her diocesan and parochial centres. In this domain may be included the creation of new dioceses and spheres of missionary enterprise. To understand the statistics of the Church's expansion it may be noted that, while a missionary area has still to be evangelized, and is yet in the earliest stage of organization, the Holy See marks out its territory, and places its missionary forces under a prefect-apostolic, who is not a bishop, but has ample powers of jurisdiction. Later on, when it has sufficiently advanced in the number of its churches and Catholic population, it is made into a vicariate under a vicar apostolic, a bishop who has delegated authority from the Pope, and has his episcopal title from some ancient or obsolete see, and is classed as a titular bishop, or what was formerly called a bishop in *partibus infidelium*. Finally, when the work of the Church has become stable and substantial, the vicariate is erected into a diocese, and its bishop, no longer a mere delegate of the pope, becomes an ordinary, invested with full canonical rights and title, and the see takes its place amongst the residential bishoprics of the Catholic Church. With these three stages in mind, one may fairly measure the Church's organic expansion by the fact that, during 1910–20, there were erected in various parts of the world 20 prefectures apostolic, 47 vicariates apostolic, and 71 new dioceses—altogether 141 territorial units added in the geography of the Church.

As to what are known as the foreign missions of the Church, the field is too vast for exact statistics. The following summary, taken from official sources published in 1918, and stated here in round numbers, may be taken as substantially correct for contemporary purposes:

The number of priests in the mission field is about 12,000, of whom more than 4,000 are natives. They have as helpers about 3,000 lay brothers and about 20,000 native workers. To these must be added a body of more than 34,000 catechists and native teachers. The number of the Catholic people in these missions amounts to 17,000,000. Of these, 13,000,000 are in Asia; 1,000,000 in Africa; 13,000 in Australia; 200,000 in Oceania; 230,000 in North American missions, and 1,000,000 in the missions to natives in South America. It is estimated that in the Catholic mission field there have been founded about 1,700 schools, in which are being educated more than 800,000 pupils. These figures represent broadly the missionary work of the Catholic Church.

The work of the foreign missions was seriously affected by the World War of 1914–18. The contributions to their finances from the devastated and from the blockaded countries were naturally diminished, while many of the younger missionaries were recalled to the colours to take part in the contest. No little dislocation of work was also due to the evacuation of the Holy See, anxious to protect the cause of the missions from being prejudiced by any suspicion of political propaganda, entered into agreements with the Allies by which, in many cases, missionaries were withdrawn from the field in the zones occupied by Allied forces, and in the conquered German colonies by others who belonged to one or other of the Allied nationalities. Nevertheless, on the whole, most of the missions were numerically stronger after the war.

Organic Reform.—Simultaneously with this organic expansion of the Church abroad there took place a notable organic reform at her centre. In June 1908 Pius X. decreed an important reconstruction of the Roman Curia, which may be described as the body of the Holy See. The Roman Curia consists of about a dozen departments of Church government, called “Congregations.” These are standing commissions charged to deal respectively with matters of doctrine, discipline, worship, episcopal appointments, foreign missions, relations to Oriental churches, and other spheres of ecclesiastical administration. Each is presided over by a cardinal-prefect, who is assisted by a number of other cardinals, and, under them, by a trained council of canonists, theologians and consultors of expert authority. Their decisions, which mostly take the form of answers to questions or petitions addressed to them from various dioceses of the Catholic Church, are made by these, when ratified by the approval of the pope, become part of the authoritative law of the Church. The constitution of Pius X. (*Sapienti Consilio*) maintained the continuity of the congregations and tribunals, but effected changes in their structure and working greater than any which had been attempted since the days of Sixtus V. in 1587. With the constitution were issued 34 canons, which regulate more clearly the distribution of work and go to secure greater efficiency and promptitude in procedure (see 7,659).

Amongst the alterations thus introduced is notably one which determines that Catholics in England, Ireland, Scotland, and the United States and Canada were classed amongst those of the missionary countries, and were placed under the charge of the Great Propaganda. Our bishops in the English-speaking countries of the world, including India, the English-speaking countries of the North American mission, and those in the Far East under the Propaganda, their bishops were appointed by apostolic briefs which it obtained for the purpose, and it was to it that they made the reports required, and to which they addressed their petitions. These were addressed to the Holy See through the Consistorial Court, and are to have the same status and ordinary government as the Church in Catholic countries. Although in several of these nations the Catholic population is still in a minority, their bishops will deal with the Holy See through the Consistorial, and be appointed and
preconized in Papal Consistory, and render to it an account of their stewardship, in the same way as the bishops of Italy, France, Austria, Spain or other parts of the world where the bulk of the people are Catholic.

This historic measure is based on the recognition of the progress of the Church in the countries mentioned. It is reckoned that there are now some 12,000,000 of Catholics in the British Empire. There are 15,000,000 in the United States, making 22,000,000 under the Stars and Stripes and, in round numbers, about 34,000,000 of the English-speaking world. This total forms more than a ninth part of the whole Catholic Church.

Restoration of the Rota.—Another important feature of the same constitution completed by the brief has been the restoration of the well-known Court of the Rota. All who have engaged in the study of mediaval history are familiar with this famous tribunal. Its connection with the Councils of the West was of supreme importance as an ecclesiastical appeal for the universal Church. It was this court that in final instance adjudged those cases of appeal to Rome which are found in such numbers in the records of every Catholic country, especially during the Middle and later Middle Ages. Such cases cast a vivid light on the state and working of the mediaval Church, and students of Church history of the school of Maitland, Othenhald or Dr. Sämgüller have found how necessary for a true understanding of them is the knowledge of the methods and procedure of the Rota and the Chancery.

The Rota consisted of a dean and 12 judges, or auditors (usually consisting of nationalities). It was a large and amiable body of advocates and notaries. Each case was heard by a panel or "turn" of three judges. If a litigant was dissatisfied with the decision he could have the case tried anew, or even a third time by a fresh "turn" of judges. In either event all cases were tried by himself, and the other two by the judge thus selected. When two or three of the judgments thus given were concordant, the case was definitely settled. (Hence the clause: "After a third definitive sentence") so often found in the records of appeals in the pre-Reformation centuries.) In the later Middle Ages the volume of judicial business in the Rota was very considerable, but in later times its importance declined, as it declined in other Courts. See has now restored it and encouraged the system of having cases tried "extra-judicially" by judges delegate, acting by papal authority, but chosen by the litigants themselves, and adjudicating in their own country, as may be seen in numberless entries in the volumes of the Calendar of Papal Letters relating to Great Britain.

Pius X. restored the Rota to its ancient preeminence as the chief court of the Catholic Church. It has now a dean, and 10 instead of 12 judges, but its procedure by "turns" or successive sentences on appeal remains substantially unaltered. It is in this tribunal that appeals on matrimonial cases are heard from all parts of the Catholic world. It is true that such cases are frequent in England and Scotland and, perhaps, more especially in Ireland, because of the Catholic and Reformed, and Miss Anna Gould and the Marquis Boni de Castelanne, who, after strenuous efforts, have failed to obtain a verdict of nullity upon their marriages. A further appeal from the Rota now lies to the Apostolic judges of the Sacred Congregation of the Index of Heretical Books and Acts Apostolici Sedis, with a summary of the facts (Compendium Facti) and of the juridical principles involved (Compendium Juris).

Reconstruction in England and Wales.—The same policy of reconstruction was applied to the Catholic Church in England. At the restoration of the hierarchy in 1850 the whole of England was included in a single province, having its archiepiscopal see at Westminster. On Oct. 28 1911 Pius X., after consultation with the English bishops, issued a constitution (S1 qua est), in which, after reciting the distribution of sees made by his predecessors Gregory I. and Pius IX., he divided the Catholic Church in England and Wales into three provinces, with archiepiscopal sees at Westminster, Birmingham and Liverpool. Westminster retained as suffragan sees the dioceses of Northampton, Nottingham, Portsmouth and Southwark. To Birmingham were given the sees of Hexham, Leeds, Middlesborough and Salford. The Archbishop of Westminster and his successors were declared to be perpetual presidents of the episcopate, with the right to wear their pallium, and to be preceded by their cross in any part of England and Wales, to preside at all meetings of the bishops, and to represent them in any dealings with the civil Government of the country, having first consulted their suffragans and accepted the decision of the majority. A further development of this plan was effected five years later, when Benedict XV., by a Bull of Feb. 7 (Rerum vivandarum), erected Wales into a new and separate province, transferred the see of Newport to Cardiff and raised it to an archbishopric, with Menevia as its suffragan.

The motive underlying this change is best expressed in the opening clause of the Bull:—"Wales, by the Celtic origin of its people, its language, customs and traditions, is so different from the rest of England that it needs, even in its ecclesiastical order, to be kept apart from the other dioceses and to be given its own hierarchy." It has been pointed out that these words are the recognition and fulfilment of a claim which was made by the popes of St. David's as early as the 15th century. Wales is a distinct ecclesiastical province and to grant the pallium to its archbishop.

The Church and Doctrine.—The action of the Church in matters of doctrine included chiefly the continuance of her conflict with "modernism," which had been condemned by Pius X. in his Encyclical (Pascendi) of Sept. 7 1907. This was followed up and reinforced by a Motu Proprio, addressed to the whole Church (Summarum Anglicarum), 1909, and then issued a Decree (Ad Apostolorum) of April 1910 declaring that the present Church, as held by the Pope, is the Church of the apostles. The Encyclical contained an elaborate exposition of the views put forward by the chief modernist writers, who for several years previously had carried on an active propaganda, mainly amongst the priests and seminarians in France and Italy and, to a smaller extent, in England and America. The ostensible object of the movement was to win recognition for a restatement of religion and the Catholic faith in such a form that it might be made acceptable to men holding the most advanced opinions outside the Catholic Church. The attention of the Pope was drawn to their utterances by several councils of bishops, and, after a full examination of their literature, the Holy See arrived at the conclusion that, in pursuing their views, they had abandoned all Catholic doctrines which they professed to explain. Such concepts as "religion," "faith," "revelation," "dogma," "sacraments," "authority," the Person of Christ," were set forth in a sense alien and contrary to that which is taught by the Catholic Church. Pius X. vigorously condemned the whole system as "a summary of all the heresies" and ordered rigorous measures to be taken to secure its elimination from the fold.

The Motu Proprio of 1910 emphasized the decision of the Encyclical, and prescribed further steps for the exclusion of all modernist doctrines, requiring that holders of ecclesiastical offices or dignities should take an oath and make a specific profession of faith for this purpose.

In the course of the years that followed, the "modernist" movement, in view of this condemnation, practically ceased to trouble the peace of the Church. Of its three chief leaders, Father Tyrrell in England, the Abbé Loisy in France, and the Abbe Murri, who was the exponent of its political and social activities in Italy, the first died in 1909, and was buried outside the Church; the second, who had already abandoned his belief in the Godhead of Christ, was excommunicated; the third left Italy and renounced all his work, and shared the same fate. Some friends of the movement had entertained the hope that, on the death of Pius X. and the accession of a new pope, the repudiation of their views might in some degree be modified and "the storm pass over," but one of the first acts of Benedict XV., in his Encyclical ad Besatisimi, addressed to the episcopate of the whole Catholic world, was to renew the condemnation of "modernism," denouncing its "monstrous errors" as a "collection of all the heresies," describing the movement in the words of Job (xxx. 12) as "a fire that devoureth even to destruction and maketh all things spring," and declaring that "nothing will not be done, either with outside nor against it, to extinguish and put out against its spirit. The effect has been to indicate that if modernism has a future it must be one that will be outside the Catholic Church.

The Church and the Social Question.—In relation to socialism and the economic questions which arise out of the conflicting claims of capital and labour, the main lines of direction to Catholic thought and action had been laid down in the Encyc-
licals of Leo XIII. In these there were two chief points which entered into the Catholic position. The first was that man has a right to possess private property, and that the right as natural and vested in the individual lies at the root of all social economy. The second is that the labourer has a right to a "living wage," and by this is distinctly meant a wage "sufficient to enable him to maintain himself, his wife, and children in reasonable comfort," and put by sufficient savings "to secure a small income." The noteworthy feature of this second point is that the living wage is taken as the fundamental postulate rooted in reason and justice, and not as something left at the mercy of the open market. And this law of society and demand. Sweating and abuses of child and female labour are condemned, and ownership, especially in land, by "as many as possible of the humbler classes" is commended and encouraged (Rerum Novarum, De conditione opificum, May 15, 1891). To this was added a plea for shortening the hours of the labourer, especially in the mining industry, so that he might have sufficient leisure for his mental and religious development. These principles had been already set forth in more elaborate form by a Catholic society known as the "Sillon," under the inspiration and leadership of M. Marc Sangnier. It had for its object the defence of the rights and the betterment of the condition of the labouring population based on the teaching of the Catholic Church. Circles for the study and diffusion of sound social principles were formed in all parts of France, and met with the encouragement of several of the leading bishops, notably Mgr. Mignon, Archbishop of Albi. As its following increased, its organization assumed a national or extra-diocesan importance, and large numbers of men who were not Catholics or merely nominal Catholics were attracted to its membership. In this way, from the original stage in which its members were frankly Catholics, it came to be in great measure composed of those who were content to pledge themselves as "not anti-Catholic." In this, the "Gros Sillon," the standard paper of the workmen of all nations and all parties and all creeds in a movement of democratic progress. Its evolution of thought and teaching went to emphasize strongly not only the rights, but in many ways the autonomy of the individual, and, in the opinion of Cardinal Andreu and several of the bishops, it has begun to emerge into what seemed to be a species of modernism applied to social economy, thus committing the Church to what many deemed to be an ultra-democratic and, therefore, a party programme. In response to many and repeated complaints made in this sense to the Holy See, Pius X. in Aug. 1910 finally addressed a letter to the French episcopate (Notre charge Apostolique) and in all parts of the later Sillonist movement which had departed from the lines laid down by Leo XIII., and requiring that the association should be brought back to its former Catholic basis, and placed under diocesan direction.

In Germany, some years before the issue of the papal Encyclical on labour in 1891, Herr Windthorst, the leader of the Centrum, had founded the great organization of German Catholics known as the Volksverein. It was followed in 1910 by the Congress of Christian Syndicates at Cologne which represented 360,000 workmen in Germany and 100,000 in Belgium and 100,000 in Italy. Associations for promoting the welfare of the labouring classes (Arbeiterwohl) and Catholic working-men's unions (Arbeitervereine) throughout Germany marked the growing interest and importance of the labour movement. At the same time societies were instituted on an international basis for the study of social problems, and circles were formed to encourage the reading and discussion of popular Catholic social textbooks and literature. In eastern Germany, Cardinal Kopp, Prince Bishop of Breslau, on the occasion of his jubilee, was met by a vast concourse of Catholic workmen, marshalled in their unions, to thank him for the work he had achieved for their organization. In the west Cardinal Fischer, Archbishop of Cologne, had encouraged the same movement, albeit on more general lines. The unions in the east were of distinctively Catholic membership, while in the west Catholic workmen were often included in unions of a non-denominational kind. This difference of policy led to a considerable amount of discussion, and comparisons between what was known as the "Breslau influence" and the "Bullain influence" were much in circulation among the German Catholics. On the one hand it was thought that the membership of Catholics would exercise a moderating influence on non-denominational associations. On the other it was felt that the strength and zeal of the Catholic unions would be best consulted by keeping them upon their own lines. In 1912 this matter was laid before the Holy See, and Pius X. addressed a brief (Singulari quodam) to Cardinal Kopp and the bishops of Germany in which he speaks in terms of the highest praise of the workmen's unions, and then, dealing with the point in dispute, lays it down that the Catholic unions are encouraged for promoting the Catholic education of the members in harmony with their religious convictions (as at Breslau). At the same time the association of Catholics in non-denominational unions (as at Cologne) is not to be condemned, provided that due precautions are taken to safeguard their teaching by their enrolment as well in the Catholic societies.

The Church and Canon Law.—Pius X., a few months after his accession to the papacy, took in hand the codification of the Canon Law, a work of monumental importance to the Church, but one so difficult that many had deemed it to be impossible.

The ordinary sources of Canon Law are the canons of Church councils, the decrees of the popes, and the constitutions. But accumulated to such an extent that their assimilation became a task which would require many minds and many years to accomplish (see §102). In 1141 Gratian, the monk of Bologna, had gathered together in his Decretum (which was not official) many of the ordinances of the Church, doing for her law something of the same service that Peter Lombard had done for her theology. Other collections of canons followed by Balbo, Gilbert, Allain, Gerard the Great, Innocent III. and Honorius III., and these materials served as the base of the great work of Gregory IX. in 1234, known as the five books of Decretals. To it were added the Decretals of Boniface VIII. (Decretum, V. Causa V., (Canon, the Extraevagantes), and these, with later enactments, formed the Corpus Juris, which throughout the Middle Ages and to our own time was the standard ground of all voluminous treatises and textbooks of canon law. The Catholic Church.

The Council of Trent in the 16th century, and the Council of the Vatican in the 19th, had urged the need of bringing codification of the Canon Law up to date, and several collections had been attempted by individual authors like Mgr. Martinucci and M. Wolf von Glanwell, but all of these had fallen short of what was required. On March 19 1904 Pius X. issued a Motu Proprio authorizing the inception of this difficult undertaking—"actum sane minus" and entrusting it to a commission of which the president was to be the Pope himself. The commission consisted of 16 cardinals, with 17 consultors.

The work was divided into 30 sections, and the first 12 were completed in the next 8 years, and were chosen as distinguished canonists or theologians from the various nations. A few days after the publication of the Motu Proprio, Cardinal Merry del Val, the Secretary of State, addressed the consultors and all parties to the project, to the end of securing that as a result voluminous communications were received from all parts of the Church, in the shape of suggestions or practical recommendations. These were duly sifted, arranged and discussed, and as far as possible adopted, and proofs and reprints were transmitted to their proponents. In this way, at the cost of much labour and time, the whole episcopate throughout the world was consulted no less than three times over as to the matter and form of the forthcoming volume. Its main characteristic was that, unlike the Corpus Juris, it would be not a series of collections of canons under various pontificates and
subdivided into titles and chapters, rendering the work of reference difficult except to the initiated, but, after the manner of modern codes, a single collection in which the codes are numbered consecutively throughout, the titles of the titles and the usual classification familiar to canonists have been maintained. It is thus not a Corpus but distinctly a Codex of the Canon Law. The gain in clearness of presentation and simplification of codes and canons is certainly a gain, and is not merely one of codification but in several ways, consistently with the immutability of law and moral principle, and within the domain of methods, a modification and reconstruction of the Church's liturgical works and codes. The treatment of the subject is a marvel of terseness and condensation, as the whole body of Canon Law, as far as the Church at large is concerned, is stated in 2,414 canons, and brought within the compass of a single book of 500 pages.

The Codex is the work of the best canonists and theologians in the Church, and occupied the Pапal Commission for more than 13 years. Pius X., as he foretold, did not live to see its completion. It was promulgated by Benedict XV. in a constitution dated Pentecost 1917, to come into force on Pentecost of the following year. A permanent commission was created to deal with all questions affecting its interpretation. On June 28, 1917, at a final meeting in the consistorial hall, a copy of the new Codex was solemnly presented to Benedict XV. who expressed the thanks of the whole Catholic Church to the commission, and especially to Cardinal Gasparri, who, as Chief of State, had from the outset been the prime mover and chief architect in the work of codification. In the medal struck to commemorate the occasion, the Cardinal stands prominent in the group of assistants that surround the person of the Pontiff.

The Church and Liturgy.—One of the great measures which will make the pontificate of Pius X. memorable in the history of the Church is his reform of the Roman breviary. It altered and improved in many ways the Divine Office or chief prayer of the Church, the recitation of which occupies the clergy for about an hour and a half each day, and thus the change was one which affected the daily life of more than 200,000 secular priests, and of many religious, in every part of the Catholic world. While the main structure and composition of the Divine Office were preserved, the alterations were greater than had been made at any time since the pontificate of Pius V. and Clement VIII. in the 16th century. They went to secure the ancient practice of the Church, reaffirmed by the Councils of Trent and the Vatican, by which the Divine Office said by the clergy includes the recitation of the entire Psalter each week.

The new breviary was prepared by a commission of expert liturgists, headed by the Pope himself. Justly the Holy See had appointed for the purpose. The papal constitution (Divina Afflatis) which brought it into force throughout the Church was issued on Nov. 1, 1911. The wording of the constitution implied that further liturgical improvements in the breviary were likely to follow. The constitution for the improvement of Church music (Muta Propria, Nov. 22, 1903) had preceded the reform of the breviary.

A notable liturgical event was the solemn celebration of Mass according to the Greek rite in the papal chapel in presence of the Pope on the centenary of St. John Chrysostom on Feb. 12, 1908.

The Church and the Eucharist.—Amongst the acts of the Holy See during 1910–20 there were innumerable decrees and briefs, issued to encourage prayer and to foster the spiritual life of both clergy and people. The great movement known as the "Eucharistic Congress" was held each year with great success in one or other of the chief capitals of the world, and included in its scope a congregation of 50,000 persons in Rome during the jubilee. The Holy See was approached and all Catholic priests throughout the world were asked to offer mass for the same purpose.

In Dec. 1914 the Pope endeavoured to induce the belligerent Powers to consent to a truce at Christmas, but failed to obtain their assent. In his allocution of Jan. 22, 1915 he pleaded especially against the devastation of the occupied territories. On May 26, 1915, when the submarine and aeroplane terror had already commenced, he issued a letter deploring "the use on land and sea of methods of offence which are contrary to the laws of humanity and to international right," and implying

685

the rulers of nations to adjust their quarrels "by reason and by conscience and by generous goodwill." On July 28 of the same year he made a similar appeal to the statesmen of the combatant nations. This method of public exhortation was the only means left to the Holy See to advocate peace, as a secret treaty (London, April 26, 1915) had been signed by Great Britain, France, Russia, and Italy, by which these Powers consented to the request of Italy that no representative of the Holy See should be allowed to take diplomatic action towards the conclusion of peace, or the settlement of questions arising from the war (Art. 26).

In the consistory of Dec. 4, 1915, and again on Dec. 24, Pope Benedict renewed his condemnation of the spirit of hatred engendered by the war and his protest against the cruel persecution of the Armenian people. He regretted that his appeal for peace to the belligerents, although received with all reverence, had failed to secure its object. On Feb. 6, 1916 the Pope received an address representing three millions of Jews in the United States, and expressed his sincere desire that in all matters they should be treated with fairness and equity. In the consistory of Dec. 4, 1916 the Pope spoke of the iniquities and cruelties of the war by sea and by land, by deportations of civilians, and air raids on open towns, and said: "We brand once more with our reprobation all the atrocities committed in this war, wheresoever they have taken place, and by whomever they have been perpetrated." In response to a petition from the cardinals, Benedict XV once more signed by the Papal See the open letter addressed to the rulers and peoples of the combatant countries to foster the spirit of goodwill, by which alone peace could be restored.

In Aug. 1917, at a time when the struggle appeared to many to have reached a hopeless impasse, he went further and addressed a diplomatic note to the belligerents, suggesting the outlines on which at least preliminary conditions of peace might be considered. These were that there should be reciprocal condonation as to the costs of war; that Germany should evacuate Belgium and guarantee its complete independence in the future, and also evacuate all French territory and possibly receive substantial indemnity from Germany. In return, the Papal See consented that all disputed territory between Germany and France (Alsace and Lorraine) and between Austria and Italy (the Trentino and Trieste) should be arranged by mutual consideration and conciliation. The argument of the note was that, whatever loss either side might suffer by such an arrangement, it would be immeasurably less than that involved in the sacrifice of life and treasure by the continuance of the war. Respectful replies were made to this note by Belgium, the United States, Japan, Germany, Austria and Turkey in writing. England answered orally by her envoy at the Vatican; and France, who had no representative there, is said to have verbally or privately admitted the legatenate's propositions. All appreciated the good intentions of the Pope as a peacemaker, but the hour for overtures had not yet come. One result of the note was that the British Government desired to be informed more definitely as to the intentions of Germany in regard to Belgium. The papal nuncio at Munich thereupon asked the German Chancellor Michaelis, and obtained precise information on the point, and Cardinal Gasparri transmitted to the British authorities the replies of the German and Austrian Governments, and offered, in case that the answer given should seem insufficient, to furnish the Pope with a statement of what his Government desired to obtain any fuller information that they might desire. The Allies apparently found that no sufficient basis existed, and the matter proceeded no further, but at the end of 1917, and previous to the great offensive of the German army, the Pope once more addressed to the Central Powers a strong entreaty to desist from methods of warfare which are contrary to international law. On May 22, 1918 he wrote to Cardinal Ferrari of Milan a letter explaining and justifying the attitude of the Holy See during the war, and replying to the manifold ways in which it had been misjudged or misrepresented.

The action of the Pope in regard to those who suffered by the war was first of all directed to making provision for the spiritual welfare of the armies engaged. In concert with the episcopate of the belligerent nations and the military authorities, the Holy See caused to be organized the body of chaplains who were to accompany the troops, and to receive through the Holy See the clothes and the uniforms of the chaplains, and more than 10,000 portable altars with consecrated altar-stones for the celebration of Mass were placed at their disposal. Prayers and Masses for the fallen were offered throughout Catholic Churches.

As early as Dec. 1914 the Pope established in the Vatican an information office with a view to relay the relatives of prisoners of war to ascertain their address. In Oct. of the same year the Pope arranged with Cardinal Harnack of Cologne to urge him to use his influence to secure better treatment for the prisoners in Germany. He wrote also to the bishops of places where prisoners were interred to obtain the permission of priests to write a letter to the language of the prisoners, encourage them to write to their families, and if need be defy the French authorities. In Sept. 1915 the Pope obtained from Germany the suppression of the camp for air-raid refuges at Neuenkirchen. At the same time he obtained an assurance from all the Powers that prisoners of war should not be forced to work on Sundays. He sent in 1917 a special delegate to visit the prisoners in Germany, charged to see, to the extent possible, the prisoners alone, and to report to the Holy See on their treatment. At Easter, 1916 the Pope sent presents to be distributed to the English prisoners in Turkey. In May 1916 he obtained the transfer of a number of English prisoners from Germany to the U.S.A., and the transfer of all prisoners from the British Government and a letter of thanks from the prisoners themselves. He procured in 1918 the liberation of Dr. Beland, former Canadian minister, who had been for four years a prisoner of war. He also obtained a transfer of 11,000 prisoners held in Turkey to British homes in the country for the children suffering from want of food.

In 1916 a commission of Austrian priests made inquiries into the atrocities perpetrated in Belgium and drew up a report damaging to the Germans. The Archbishop of Vienna courageously read the report publicly from the pulpit, whereupon the Austrian Government, at the instigation of its ally, wrote to the Pope asking that the report should be suppressed. The Pope was not willing to suppress the facts on technical grounds. He received in the following year a letter of thanks from King Albert for the help and sympathy given to Belgium throughout the war. The Holy See had sent 100,000 francs for the starving children in Vienna, and had distributed 2,000 cases of poultry, 2,000 cases of bread, 1,000 cases of sugar, and 1,000 cases of butter to children in Belgium, and a larger sum to be distributed to the sufferers in the devastated regions in France. At the same time, he received the thanks of the Belgian Government for obtaining the release of more than 50 persons who had been condemned to death by the Germans. He was able at the same time to procure from the German headquarters the liberation of a large number of French prisoners and the repatriation of civilians from the northern districts of France. His intervention was so successful in obtaining from the Austrian Government the release of a considerable body of Italian prisoners of war.

Immediately after the conclusion of the Armistice the Holy See communicated with the several Powers and urged the speedy liberation of the prisoners that remained in their hands. In Aug. 1918 the Pope, in response to a petition from 200,000 war widows in France, celebrated Mass for their husbands, in the presence of a large pilgrimage from their number sent to Rome for the occasion. The fund which Benedict XV. organized throughout the Church in behalf of the starving children in the countries ruined by the war had by early in 1917 reached the sum of more than 11,000,000 lire (then about £6,000)."}

Amongst the chief authorities on which the above article is based are the official reports of the Holy See, the Acta Apostolicae Sedis, the Annuaire Pontifical of Mgr. Battandier, and the volumes of the Documentation Catholique. (J. M. O.) III. THE FREE CHURCHES DOCTRINE.—The disquietude caused among the Free Churches in Great Britain by the "New Theology" movement (1907) had no long life or lasting effect. At the Congregational Union meeting in Nottingham in Oct. 1917, Principal Forsyth and Rev. R. J. Campbell, who had figured most prominently in the controversy, appeared on the same platform. In 1916 Mr. Campbell was ordained into the ministry of the Anglican Church, and withdrew his book from publication. The attacks on the historicity of Jesus, put forward by A. Drews in Germany and J. M. Robertson in England, were met with thoroughness and skill, especially by Dr. Edward Carpenter, of Manchester College, Oxford. The question of miracles, brought into prominence by the Rev. J. M. Thompson, of Magdalen College, Oxford, led
to some discussions, but neither it nor Dr. Schäfer's utterances on the origin of life (British Association, Dundee 1912) stirred the waters to any extent. The general position of biblical scholarship is well illustrated by Peake's Commentary on the Bible, to which not only Free Churchmen but several Anglicans contributed. Dr. Buchanan Gray has (continuing the work of Dr. B. H. Rainbow) produced a monograph on Job. Per-
haps the outstanding work on theology is Dr. R. S. Franks' History of the Doctrine of the Work of Christ (1918). Popular clamour during the war against German theological works had no echo among scholars. The younger men were becoming busily concerned with the application of the Gospel to the conditions of the post-war world; their activity is illustrated in The Christian Revolution series and the publications of the Student Christian Movement. Two books by Dr. T. R. Glover, of Cambridge, The Jesus of History and Jesus in the Experience of Men, have had a wide circulation.

There is no disposition among those churches that dispense with formal creeds to introduce anything of the kind, and where confessions are already in existence the tendency is to modify and adjust them, or to regard them as declaratory rather than binding. Thus the English Presbyterian Church has revised the statement of Church principles made at the ordination of ministers, and the form of the questions put to the candidate, the aim being to lay more emphasis on the minister's message and less on his theory. Similar steps were being taken in 1921 by the U.F. Church in Scotland. On the other hand, proposed unions of Methodists, Presbyterians and Congregationalists in the United States, the last-named denomination in a confession or creed, or at least a statement of faith which in most cases would be accepted for the sake of union. The war gave rise to some discussion on prayers for the dead, and it may be said generally that the old rigidity has given way here to a more open-minded spirit. It is sufficient merely to mention other discussions raised by the war—providence, patriotism, conscience, reprisals, eschatology—which found expression in books and still more in pamphlets.

Union and Federation.—Looking for a moment to the overseas dominions, which in so many ways have developed their impact on the home land, far-reaching movements had come by 1921 into operation. The Baptists, indeed, stoutly maintained their distinctive witness, and were disinclined toward schemes of amalgamation. But both in Australia and Canada Presbyterians, Methodists and Congregationalists were steadily approximating. The first-named Church, not so unanimous as the others, did not give a sufficiently decisive vote in Australia in the autumn of 1920, but negotiations, accompanied by a large measure of cooperation, still continued. In Canada also the Presbyterians had been the most cautious, but in June 1921, by a majority of about 400 to 100, they agreed to union with the other two bodies. In New Zealand Congregationalists were being absorbed into the Presbyterian Church. In the mission fields, especially in South India and to some extent in China, the movement was much more successful, and included Episcopalians. In East Africa the Kikuyu controversy (in which the Bishop of Zanzibar dissociated himself from his brethren of Mombasa and Uganda for their fellowship with non-Episcopal missionaries in an attempt at union in face of Moslem aggression) created some unpleasantness, but a modus operandi was found. In Great Britain, apart from Scotland, it cannot be said that any new organic union was in 1921 actually in sight. For some years past the three next Methodist connexions (Wesleyan, Primitive and United) had been exploring avenues to union. Among the difficulties were the proportion of lay to clerical representation in Conference, and the relative priority of representative and pastoral sessions. Some Wesleyan leaders felt that the contemplated union might prejudice the case for the larger union. It seemed possible that Primitives and Methodists might come together apart from Wesleyans, but probable that patient continuance would secure the triple bond.

Meanwhile the overlapping of Free Churches in smaller towns and villages made for weakness, and caused concern to the leaders of the different denominations; and it was with the design of securing closer cooperation that Rev. J. H. Shakespeare, when president of the National Free Church Council at Bradford, 1916, propounded a scheme for federating the Evangelical Free Churches of England, which was afterwards accomplished. The federation differed from the National F.C. Council in that its executive membership was constituted by way of conference or assemblies of the different communions, and its aims and objects were specifically moral and spiritual. Alongside this there was increasing cooperation in the mission field, in social service and in the training of ministers, especially in the theological faculties at London and Manchester. One of the most impressive demonstrations of the Free Church unity was the thanksgiving service after the Armistice, in the Albert Hall, London, at which the King and Queen were present.

Relations with the Anglican Church.—In spite of some tension caused by the question of Welsh disestablishment and the commemo-ration in 1912 of the ejection of 1662, there was between 1910 and 1920 a decided growth of sympathetic and amicable feeling between the Anglican and the Free Churches and no small amount of cooperation. British Nonconformists still believed that they were entitled to more real recognition at State fes-
tivals, and valued the fellowship exemplified at the installation of the Prince of Wales at Caernarvon in July 1911. In the academic world, churchmen of all denominations worked together in harmony and full trust on the theological boards of the newer universities; and the removal of the restrictions on divinity degrees at Oxford, Cambridge and Durham was widely appreciated. The placing of a Bunyan memorial window in Westminster Abbey, and its joint dedication by the Dean and representatives of the Free Churches, was a happy sign of the time. During the war, chaplains of both sides learned to appreciate each other and worked happily together, and the same stress did much to bridge the chasms at home. United services of intercession and thanksgiving were frequent, and created a new sense of fellowship. The action of the Bishop of Hereford (Percival) in inviting Nonconformists to a coronation communion service in the cathedral in 1911 was in advance of common Anglican sentiment, but the fact that Dr. Jowett preached in Durham cathedral in 1910 (at the invitation of the Bishop, Dr. Moule), and Bishop Weldon, Dean of Durham, in Westminster chapel in 1921 was significant. The Lambeth proposals indeed rather deprecated any such pulpit exchanges, though it might seem, as Dr. Wallace Williamson intimated to the Archbishop of Canterbury at the Church of Scotland Assembly in May 1921, in the light of Scottish experience, that they pave the way to union more surely than theoretical discussions.

The Lambeth proposals were discussed in nearly all the "supreme courts" of the Free Churches and by the Federation of Free Churches, and received sympathetic and friendly con-
sideration. Free Churchmen were not slow to indicate certain ambiguities of utterance in the proposals and to assert the impossibility of accepting reordination. But in 1921 they were coming to see that the Lambeth proposals were not an ultimatum so much as an appeal to "come and reason together." It was possible that along the line of this idea of "extended com-
mmission" the difficult question of reordination might be avoided. It was great gain that the proposals did not contemplate the absorption of non-Episcopal communions in the Episcopal fold, but the Anglican leaders had hardly yet made that detailed study of the history and principles and genius of nonconforming Churches that seemed essential to any realization of their sugg-esions. Many Nonconformists would require a readjustment of the relations of the Anglican Church to the State, and many more looked askance at any proposal involving relationship with the Roman or Greek Churches. Meanwhile there were abundant opportunities for united service which did not entail the least abandonment of conviction and principle on either side. In the mission field, in theological study and in social service, there was already manifest in 1921 a degree of coöperation and fellowship which was full of promise for the consummation of a unity that need not be confounded with uniformity.
The World Conference on Faith and Order, propounded by American Episcopalians, and temporarily frustrated by the war, was sympathetically considered by Free Churchmen. A preliminary meeting held at Geneva in Aug. 1920 attracted 120 delegates from 40 countries. A continuation committee of 55 members was appointed.

**Modifications of the Independent Position.**—In the Baptist and Congregationalist denominations the decade 1910-20 was perhaps the most important in their history. Great movements in thought and action transformed both the polity and the position of the denominations. The movement in thought may be indicated by saying that they had come gradually to realize that Independency, pure and simple, as it was understood and practised in earlier days, was no longer sufficient to meet the conditions of modern religious life. And the main movement of polity was in line with that of the world as a whole in substituting the ideal of interdependence for that of independence.

This movement of thought found expression in two or three main directions. In the first place it was generally recognized by 1921 that the training, the appointment and the proper support of the minister was not the concern of the individual church only but of the whole denomination. This recognition led to the raising of sustentation funds of £250,000 in each case. The object of the funds was primarily to secure to every accredited minister a minimum stipend adequate for his support, but inevitably the scheme could not stop there. If the denomination accepted responsibility for the support of the minister, it followed logically that it must have some voice in his training and appointment. Not much had yet been done up to 1921 towards a reform of the college system, though a beginning was made by the creation of a united collegiate board in each denomination and further advance was inevitable in this direction. But in the matter of ministerial appointments the scheme introduced radical changes into the old Independency. It combined provision both for sustentation and settlement. Churches were still left free to call anyone they chose as their ministers, but grants from the sustentation fund were conditional on their choice being approved by the executive committee of the fund.

Another important provision of the Baptist scheme was that all appointments to the pastorate of aided churches should be for a definite term of five years, and then should automatically cease unless renewed by the express invitation of the church, with the consent of the executive committee.

With the introduction of these changes it specifically became clear that the responsibility of the denomination for the ministry could not end even here. If all pastores were to end automatically after five years, there must be some central organization, like the synods of the Connexional Churches, to secure other pastors for the ministers thus out of charge, and to maintain them during the time they were out of office. Accordingly the system of general superintendents was introduced. The country was divided into 10 areas, with a general superintendent in charge of each, whose duty it was to visit the churches, to advise them in their perplexities, and, in concert with the other superintendents and the executive committee, to arrange for the resettlement of ministers at the expiration of the term of their pastores. This part of the scheme, which introduced the most important change into the older Independency, was an unqualified success. While still leaving the churches full liberty in the management of their own affairs, it completely solved the problem of ministerial settlements which was one of the most serious questions in earlier days.

The Congregationalists had in 1921 not yet gone so far as the Baptists, who in their general secretary, Dr. J. H. Shakespeare, had an ecclesiastical statesman of rare gifts. They did not subject the aided pastores to a five years' term, but they divided the country into nine similar provinces with a moderator in charge of each, whose functions and duties practically coincide with those of the Baptist superintendents. This scheme was only launched in Nov. 1919, but had already justified itself by 1921.

**The World War.**—The Free Churches of Great Britain bore their full share in service during the World War. In earlier days Presbyterians (through the Church of Scotland) and Wesleyans alone had any army chaplains or army work. But when the men of the Free Churches entered the British forces by myriads, provision had to be made to meet their spiritual needs. Under the leadership of Dr. Shakespeare a United Navy and Army Board was formed by the Baptists, Congregationalists, Primitive Methodists and United Methodists, to appoint chaplains to the members of these four denominations. No fewer than 320 chaplains served with the forces in the home camps and all theatres of war, many of whom were awarded high distinctions. After demobilization the board remained, and in 1921 represented by five permanent chaplains.

With the great increase in the cost of living the lower stipends of ministers in all denominations became quite inadequate. Local effort was often unequal to the task of rectifying this, and denominational machinery had to come to the rescue. The fall in foreign exchanges due to the high price of silver in 1919-20 put a heavy burden on the missionary societies and led to much hardship in the foreign fields. Generally speaking the situation was met with courage and zeal. The Baptists, e.g. in six months in 1920 raised a new fund of £470,000, of which half was for the relief of the missionary society and half for increasing the minimum stipends of the home ministry. The Congregationalists were in 1921 promoting a fund of £500,000 for similar purposes, and especially for a superannuation scheme. Methodists and Presbyterians were similarly diligent. With the fall in the price of silver the foreign aspect was improved.

The war brought other difficulties. The revelations made in the survey published under the title of The Army and Religion, as to the relative ignorance in spiritual matters of men of all denominations, caused much heart-searching. In church circles, as in other departments of the nation's life, there were disappointments and disillusion. Neither war nor peace had brought the millennium. The churches were not filled. The theological colleges, depleted and generally closed during the years of war, were by no means filled again afterwards. For some years there had been no adequate output of ministers, and the outlook was not bright in 1921.

The Society of Friends, with its particular peace testimony, met the situation of war in its own way. While many of its young men suffered as conscientious objectors, others embraced dangerous non-combatant service such as mine-sweeping; many more were engaged in Red Cross work, and the Society as a whole did invaluable work in repairing waste places, assisting in the restoration of villages and lands, and in combating disease and famine in Allied and (since the war) in enemy countries alike.

One curious effect of the war was that Nonconformists became much more familiar with liturgical forms of service. The many united services of intercession and thanksgiving were responsible for this, and it was significant to note the number of new manuals issued, containing systems of common prayer and praise. Presbyterians, Congregationalists and Methodists alike were drawn into this movement. The elasticity of the Free Churches was well illustrated by the ministry of Dr. Orchard at the King's College Chapel, London, where a full trained army chaplain was in use long before 1921 and a high sacramentarian practice followed. Dr. Orchard was also the leader in what is known as the Free Catholic movement.

**Other Denominational Activities.**—Two great ecumenical conferences were held in 1911, both in America. The Baptists met at Philadelphia; one of the most striking features of the gathering was the presence of a group of ministers from Russia and S.E. Europe, where the Baptist cause was making phenomenal headway. The war played havoc with this progress, but afterwards there were indications once more of reconstruction and growth. The same may be said of the Presbyterians of Hungary and Transylvania, who suffered additionally by the unsympathetic action of Rumanian officials. Methodists of all shades met at Toronto in 1921. The war prevented these international gatherings for some years, but Congregationalists held their Fourth International Council at Boston in 1920, and Presbyterians met in Pittsburg in Sept. 1921. Another noteworthy
The Salvation Army returns 9,615 corps, circles and societies; 17,288 officers and cadets; but gives no returns as to adherents. In Ireland the (disestablished) Episcopalian Church claims about 600,-000 of the population, the Presbyterians 450,000, the Methodists 60,000. Congregationalism is not a large factor. Allied Organisations.—The Brotherhood movement, in some places known as the P.S.A., was particularly hard hit by the war, and was still finding reconstruction difficult in 1921. But a great opening had been made in many places, and there was an apparent desire on the part of the people who are addressed are given on Bible subjects or on themes of current interest from the Christian point of view, much stress being laid on the obliga-
tions of the Christian citizen, and the need of moral uplift. The Spirit of the age is naturally focused on the continent of Europe, and had much success in Canada. The Adult Schools, a much older institution, and one in which Friends' have been especially active, have been hampered by the lack of suitable local buildings, but are doing extremely good work. An attempt has been made through the means of the club movement and of the Village School, to reach the young people who meet usually on Sunday mornings about nine o'clock. Sunday Schools have suffered in the number of scholars, but the quality of the work done is rapidly improving, as better method of teaching and administration is adopted.

The Y.M.C.A. found its great opportunity in the war. By its operations at first in the home camps and then by invitation in N. America to service in every kind of work, near and far. It led the way in ameliorating the life of the soldier. It gained the good-will of many of the men in the field and their relatives at home, of Government and of employers by its labour. Its after-war programmes, somewhat ambitious, have received much support, while the work of many another concern, was checked by the depression and financial stringency, but its Red Triangle Clubs did good work.

The Student Christian Movement is one of the most vital Christian agencies in existence, and affords a happy meeting ground for the ideal spirit of Primitive Christianity. It is diffused all the world over, and has gained a wide and valuable influence. In 1921, when it was chiefly concerned with foreign missionary aims, and is now placing alongside those the claims of social service at home. It is increasingly powerful in other countries, and held an important international gathering in London in 1920.

The British and Foreign Bible Society and the Religious Tract Society are the willing handmaids of all the churches. They too did excellent work during the war of stress, and continued it afterwards, though hampered by the high cost of production. In March 1911 the 300th anniversary of the issue of the English Authorized Version was worthily commemorated. With regard to Bible revision, a number of Free Church scholars issued a manifesto in Oct. 1921, stating that, in their opinion, the time was ripe in view of the work yet to be done in getting an approximately true text of the original Hebrew and in utilizing recent linguistic discoveries affecting New Testament texts. A number of them also joined with representative Anglican scholars in a public protest against the issuing of the revised Bible of 1881-5 without the reviser's own approval. A new translation of the New Testament by Rev. J. Moffatt, of the United Free Church College, Glasgow, has gained high appreciation and wide use.

IV. THE PRESBYTERIAN CHURCHES OF SCOTLAND

In Scotland, apart from the relation of the World War to religion and the churches, the most prominent question between the United Free Church and the Church of Scotland and the United Free Church. These two communities embraced nine-tenths of the church members in the Northern kingdom, and thoughtful men on both sides had long been anxious for closer fellowship in the face of decreasing rural populations and the increasingly serious problems of the cities and large towns. Holding the same standard of faith and order these two great wings of Presbyterianism had practically everything in common except the State connexion. Patronage in connexion with ministerial appointments which led to the disruption in 1843 ceased to operate in the Established Church a generation ago, and is a legacy for the Church of Scotland of the Church of the Free Church and the United Presbyterian Church in 1905 was a predisposing cause to the thought of a larger union, and in 1910 the two Assemblies (Established and United Free) appointed committees to confer on the causes which keep the two Churches apart. These causes were not primarily connected with doctrine, discipline or worship, but with the spiritual independence of the Church, its freedom from parliamentary interference with doctrine, discipline and worship. The United Free Church felt that, in spite of the absence of any conflict between Church and State in Scotland for 70 years, the decisions reached by Lord Brougham's judgments in the 1820s and early 1830s had witnessed to the State's claim to be omnipotent in the spiritual as in the secular domain. In 1912, in a document known as the Memorandum, the Church of Scotland committee gave a new turn to the matter by suggesting: (1) that instead of the State

conceding spiritual liberty to the Church and prescribing its limits, it was for the Church to formulate and assert its own liberty and prescribe the limits within which it claimed freedom from external interference; (2) that instead of disputing over the terms establishment and disestablishment an attempt should be made to put the Church in a relation with the State not inconsistent with the historical ideals of either church. With the coming of the war, active negotiations were suspended, but the years of strife brought the two churches very closely together in many practical ways, e.g. in the temporary amalgamation of the divinity colleges, and in local parochial and congregational arrangements. With the advent of peace, the lines of the Memorandum having been already generally approved in both churches, a new step was taken by the formulation of a series of Drafts as might be expected, more unanimous and energetic than the Church. The United Free Church held that it was for the Church of Scotland alone to straighten this matter out with the State, and though it approved the Draft Articles as formulated it would not join in any approach to Parliament with a view to legislation. The Government was well disposed and in 1921 introduced and carried through a bill to give effect to the Draft Articles. The bill did not, of course, unite the two churches, but it was a step towards union. Opposition to it came from both sides. There were those in the Church of Scotland who said that it meant virtual disestablishment, and the whole nature of the Church's position in the State. On the other hand there was a body of opinion in the United Free Church, which saw in the bill rather the reestablishment of the Church of Scotland, the retention of all its exclusive privileges, e.g. as to royal and Indian chaplaincies and university divinity chairs. Nor did this bill touch the teints or tithe endowments. It must be remarked here that the United Presbyterian Church had been strongly voluntary, and that the Free Church, though it had not disrupted on this point, had also by the time of the Union in 1900 come to be a staunch supporter of the cause of disestablishment and disendowment. The bill of 1921 was to be followed by legislation dealing with the teints and until this question of the patrimony of the Church of Scotland was settled there could be no technical negotiations for union.

The question of the teints had come up in another connexion. Stipends of parish ministers in Scotland were regulated according to "fairs," i.e. the prices of grain largely struck or fixed at an annual court in each shire. During the war these prices rose enormously. The ministers found the result as agreeable as the heritors found it irksome, and considerable discussion (culminating in a Parliamentary bill introduced—and withdrawn— in the autumn of 1929) took place on attempts at compromise. At both the Church of Scotland and the United Free Church Assemblies in May 1921 the Lambeth proposals were submitted in writing by the Archbishop of Canterbury and the Bishop of Peterborough. These prelates were very heartily received and sympathetic replies were given by representative leaders. The official response of organized Presbyterianism was given at the Pan-Presbyterian Council, meeting in Pittsburg, U.S.A., in Sept. 1921. A joint conference of Anglicans and Presbyterians, meeting in Montreal during the spring of 1921, unanimously agreed on forms of service by which "extension of commission" might be given to and by the respective parties, but this agreement was personal rather than official.

In the matter of social problems and social service both churches have been active. The Church of Scotland appointed a commission on the war, and the result of its inquiries was a valuable survey entitled Social Evils and Problems, prefaced by a statement on "The Ethical Mission of the Church" by the Rev. Prof. W. P. Paterson. That the same church was alive to the needs of the hour was evidenced by the appointment in 1920 of a committee to inquire into the recrudescence of spiritualism. In the temperance campaign which preceded the first series of elections on the Local Option issue, the United Free Church was, as might be expected, more energetic and the Established, though some powerful champions were found in the ranks of the latter. One particularly interesting scheme in which both churches were uniting in 1921 was a memorial to Scottish soldiers who fell in Palestine. This was to take the shape of an Archæological Research school in Jerusalem with a Scotch kirk attached. The two churches also co-operated in the endeavour to rebuild the broken life of their coreligionists in central and south-eastern Europe and to re-establish mission work in Palestine and Syria, where the new conditions had entirely altered and complicated the situation. The churches gave of their best during the war in combattant and non-combattant and remedial services. The noteworthy volume entitled The Army and Religion owed much of its value to the editorial skill of Dr. D. S. Cairns of the Aberdeen U.F. College. The Scottish churches, like others, had not up to 1921 been receiving the recruits for the ministry that were expected on the cessation of war, and the position seemed likely to become acute in a few years' time. Even if the projected Union was accomplished, the experience of the United Free Church since 1900 showed that it would be a matter of some difficulty to get local congregations to unite even in places where all could be well accommodated in one building.

Among the smaller Presbyterian churches, the Free Church remained vocal, but made little progress and found it increasingly difficult to get ministers. Its chief strength was in the Highland and Western Islands. The Free Presbyterian Church, the Reformed Presbyterian Church and the Synod of United Original Seeders remained stationary.

The following figures give some idea of relative strength in Scotland:

Further particulars, also those relating to the smaller Presbyterians and to the Wesleyans and Primitive Methodist Churches, will be found in the respective year books and in the Scottish Church and University Almanac.

(A. J. G.)

V. CHURCHES IN THE UNITED STATES

The most accurate statistics for the religious bodies of the United States in 1920 were undoubtedly those published by the Federal Council of the Churches in the Year Book of the Churches, the figures being so far as possible those reported by the church bodies themselves. Unfortunately, the progress made during the decade 1910-20 cannot be measured precisely, for trustworthy statistics are not available for 1910; the nearest approach are those of the U.S. religious census for 1906 published in 1909. Using these two sources, the number of local Christian church organizations of all forms in the United States is seen to have grown during 1906-20 from 208,675 to 234,376, the number of ministers and priests from 104,830 to 186,018; the membership from 32,447,741 to 44,322,215; the number of Sunday schools from 189,391 to 199,774; the Sunday-school enrollment from 16,238,683 to 20,892,327.

For Roman Catholic churches the increase during the same period was as follows, the figures for 1906 being taken from the U.S. census and those for 1920 from the Official Catholic Directory:

<table>
<thead>
<tr>
<th>Church Organizations</th>
<th>Cardinals</th>
<th>Priests</th>

<td>3</td>
<td>21,543</td>
</tr>
</tbody>
</table>

The growth of Protestant churches, as given by the census and the Year Book already cited, has been as follows:

<table>
<thead>
<tr>
<th>Church Organizations</th>
<th>Ministers Members</th>
<th>Schools</th>
<th>Enrollment</th>

<td>20,095,513</td>
</tr>
</tbody>
</table>
In comparing these figures with those already given for the Roman Catholic Church, it should be noted that the Roman Catholic figures include as members all baptized persons, whether confirmed or not. The Protestant practice is to include in a count of members only those who were communicant members when the enumeration was made. The estimated Protestant population, counting all members of any family in which anyone is a communicant member of a Protestant church, grew from 30,000,000 in 1906 to 40,000,000 in 1920, an increase of 33%.

1893, Christianity, Cleveland effective would be local fresh religious various churches, to bodies, estant and been however, Catholic annual of the millennium, another Protestant year is shown, The Church was in the enlargement of its membership, and in fact the Church has been growing steadily, with but few exceptions, the leading Protestant missionary boards were thoroughly committed to this policy. The same was true, in scarcely less measure, of the educational boards. In 1917 these united in the Council of Church Boards of Education, which collated information, studied the standardization of courses in church schools and colleges, and held conferences of university pastors and other church workers in the larger institutions. The Sunday-school agencies of the denominations formed in 1911 the Sunday School Council of Evangelical Denominations, for cooperation in educational, editorial, missionary and publishing activities.

The Interchurch World Movement of North America was organized by representatives of Protestant mission boards in 1918, primarily to meet the urgent need of expansion in missionary work as a result of the war. It rapidly extended its scope, however, to include surveys of all-Christain work at home and abroad, missionary education, recruiting for the ministry and mission service, and a simultaneous appeal for funds by all cooperative church bodies. The movement failed, owing, among other things, to unbusinesslike financial operations and the uncooperative attitude of a good part of some of its leaders; but it revealed a widespread spirit of cooperation.

In the third field of cooperation and union, that of the denominations and church bodies as ecclesiastical organizations, the development has proceeded along two lines: federation and organic union. The first is represented especially by the Federal Council of the Churches of Christ in America, organized in 1908, in which about 30 Protestant denominations are officially represented. While retaining their autonomy the
uniting church bodies have provided representative organization which operates through various commissions, including those on the Church and social service, evangelism, councils of churches, the Church and country life, temperance, Christian education, relations with the Orient, international justice and goodwill, and relations with France and Belgium. A staff of secretaries at New York and Washington care for these activities.

Side by side with federation has developed a movement in the direction of organic union. In several denominations union has taken place, as between Baptists and Free Baptists, and among various Lutheran churches. There has been approach, also, between unrelated communions, as Congregationalists and the Protestant Episcopal Church. The year 1910 was notable; on the same day there was organized, by the Protestant Episcopal General Convention, the Commission on a World Conference on Faith and Order, and, by the Disciples of Christ, the Association for the Promotion of Christian Unity, while earlier in the same year the Christian Unity Foundation had been formed. Over 70 commissions have been appointed by various church bodies to cooperate in plans for the conference on faith and order. The proposal contemplated an organic union of all the churches, Protestant, Roman Catholic and Eastern Orthodox, on the basis of an agreement concerning essential doctrines. The Roman Catholic Church, however, declined to participate. Some important Protestant churches, also, look with little interest on the conference.

The tendency in the movement towards church unity has been toward, not a complete amalgamation of denominations, but a federal union which would allow for diversity of temperament, practice and doctrine. Such was the purpose of the Council of Organic Union held in 1918, attended by representatives of 19 Protestant denominations. An ad interim committee was appointed which presented a plan of union at a second conference, in 1920, to become effective when adopted by six denominations.

Social Service.—The widening interest in social questions was a notable development of the decade 1910 to 1920. This showed itself, first, in the recognition of social service in the programmes of the various national church bodies, and, later, in its growing recognition by local churches. During the first half of the decade most of the larger Protestant denominations adopted in their national gatherings a definite social service programme, nearly the same as the “Social Creed of the Churches” put forth by the Federal Council of the Churches. A similar statement was published by the social service commission of the American Federation of Catholic Societies. Social service commissions or departments were organized by most of the larger denominations, many having executive secretaries in charge. The commission on the church and social service of the Federal Council has been one of the most active commissions of that body since its formation, and more recently the National Catholic Welfare Council has put in operation a vigorous social programme. One result of this development of social interest is seen in the place given in the theological seminaries to social service and training for community leadership. Quite as significant is the addition of these subjects to Sunday-school study courses. So far as the official organizations of the denominations are concerned, social service has become definitely established as a vital part of their programme.

Naturally the progress in the local churches has been slower, but it may be said in general that the churches have come to recognize their social responsibility, though in their working programmes they differ widely. While the movement of churches from the business sections of large cities toward the residential sections and suburbs still persists among Protestant churches, a tendency in the opposite direction has also developed, and well-organized churches are being established in the heart of large cities. In some cases several denominations have cooperated in apportioning the field. In Cleveland, for example, 30 such churches are planned, of which 10 are already in operation, different sections being cared for by different denominations. A similar and allied movement is the establishing of Christian centers or community houses. These are under church direction, are staffed by trained workers and undertake various activities: kindergartens, day nurseries, mothers’ meetings, industrial classes, forums, boys’ and girls’ clubs, employment bureaus, rescue work, lectures, music classes, gymnastics, etc., besides the study and religious worship. In the larger communities progress has been slow, but in many of the Protestant denominations larger attention has been given to the cultivation in the country churches of the ideal of thoroughly going community service—religious, social, educational, economic. Both nationally and locally the churches, city and country alike, have exercised a powerful influence in favour of prohibition, and the adoption of the Eighteenth Amendment is due principally to their efforts.

In the field of industry, the social service pronouncements of the churches have been outspoken in favour of better conditions and opportunities for labour. Efforts have also been made to cultivate closer relations with the unions, as by sending fraternal delegates or appointing special representatives. The Federal Council of the Churches each year issued a Labour Sunday message for the first Sunday in Sept. and many churches observe the day.

Missions.—The American churches in their mission work have progressed in cooperation, organization and expansion. The decade opened with the holding of the World Missionary Conference in Edinburgh, in which American Protestant mission boards played a large part. As a result of this conference and the Congress on Christian Work in Latin America, held at Panama in 1916, and of the mission conferences that followed in many mission fields, the boards have largely broadened their field of cooperative activities, particularly in educational and medical work. Other important factors in this development have been the development of the conferences of North America, the Federation of Women’s Boards of Foreign Missions, the Home Missions Council and the Council of Women for Home Missions, which represent most of the mission boards of the Protestant church bodies. The Edinburgh Missionary Conference resulted in increased efficiency of organization and greater interest in missions. In several church bodies missionary agencies have been combined and missionary administration centralized; steps have also been taken toward uniting the missionary agencies of different denominations. Increased attention has been given to missionary education, through study groups, women’s societies, Sunday-school classes, and reading contests. Interdenominational summer conferences and schools for development of missionary leaders have grown rapidly in number and quality of work. A very important movement has taken place in the securing of new missions. Some denominations have appointed candidate secretaries for their mission boards, and interdenominational conferences have been held to consider the problem. The most significant development in this connexion was the organization in 1911 of the Board of Missions for Preparation, which made a thorough study of the methods of preparing for work among peoples of different lands and different religions.

The rapid expansion of mission work by the American churches during the decade will be evident from a few figures. For home missions the Protestant churches appropriated in 1912 (the first year for which figures were compiled) $10,653,119; in 1920, $25,153,601. The number of home missionaries is fully reported by the church boards in 1916 was 5,372; in 1920, 4,473. Foreign mission income grew even more rapidly, the figure for 1910 being $1,946,281 (including both the United States and Canada); in 1920, $20,897,620. The number of foreign missionaries sent out was as follows (United States and Canada):—

In 1910 the Roman Catholic Church had 90 American foreign missions. In 1920, 50. The American Roman Catholic foreign mission service was founded during the decade, and several religious orders of this Church were engaged in preparing men and women for the foreign mission field. New enterprises which have been undertaken the policy has been primarily to strengthen existing work. Expansion has taken place especially in union schools, colleges, hospitals and other institutions. Some denominations have faced the challenge of opening new parts of the world which might be considered as their responsibility, and after careful survey of the needs and requirements they have undertaken financial campaigns covering home and foreign missions and education. The total number of these forward movements was

these changes lies in the growing recognition of pedagogical principles in the church school. Schools having graded departments and a graded curriculum have increased in number, and the higher standards set by them have led to the creation of an excellent body of technical material for teachers and executives. The importance of a trained teaching force is gaining larger recognition; standards for the preparation of teachers have been raised in many parts of the country. This new interest in religious education has led to important developments. A new religious profession is growing up, that of director of religious education in a local church. Colleges and theological seminaries in large cities have given special attention to religious education, and several have organized departments or schools for the study of this and allied subjects. Especially noteworthy is the providing of scholarships in the Protestant churches as a result of the increased attention to the educational side of the work. This change began before the decade under review, but has now become practically universal in its influence. Finally, it is being recognized that the ordinary Sunday-school session does not give sufficient time for proper religious instructions, and various methods of week-day instructions have been adopted, by churches separately, or by groups of churches, or in cooperation with the public schools.

There is a growing feeling of responsibility for their educational work on the part of the churches. Boards of Education have been organized by some denominations and those of others have been strengthened. The increased financial interests of the denominations, the increasing attention paid by the public schools to religious education, and the relations between the churches and the schools and colleges, both denominational and undenominational, have been made correspondingly closer. The new denominations, especially, have recognized the value of religious education as a means of reaching the boy and girl, for example, set aside a very large sum for educating worthy men, regardless of their church relations, and Protestant churches have correspondingly enlarged their programme. Roman Catholic institutions have also conducted financial campaigns and largely increased their funds. Most of the money has been raised for the equipment or endowment of institutions founded legally or by tradition. The varying results with increasing success in the extension of religious education, and the strengthening of teaching force. In most of the denominational schools and colleges the Bible has a prominent place in the curriculum, the number of chairs of Biblical literature or religious education having been increased, the development of the larger and more important denominations has been the installation of university pastors by various denominations in connexion with the larger institutions, to care for their own students, to keep them in touch with the church, to give friendly counsel in their problems, to organize Bible classes, etc., in smaller institutions several denominations combine in the support of one representative. There were 320 of these workers in 1920 giving whole or part time to the work. A student church has been organized in a few centres, and some denominations have undertaken the establishment of a school of religious education in connexion with a university. All these church representatives work in close connexion with the Church Educational associations, conferences, directed by the Y.M.C.A. and Y.W.C.A. or by the denominational education boards, have grown in importance. Cooperation with these two organizations and with another thorough-going effort of the American Bible Union (1911) has been a growing feature of the educational work of the churches during the decade.

In the development of religious experience has become increasingly the test of doctrine, and interest has shifted from dogma to life. Religion is thought of in terms of this life, not primarily with reference to the next, considered not as belonging to one part of man's life but as affecting the whole range of human possibilities. New methods are being developed. There were educational sessions during the decade in (1) laymen's activities, especially in the Laymen's Missionary Movement, the Men and Religion Movement and the Y.M.C.A.; (2) religious publications; (3) church life and worship; (4) church papers and the increasing use of secular newspapers and magazines for advertising and descriptive articles; and (3) international relations, in which there has been a widening of interest and cooperative effort through denominational and undenominational organizations.

CILICIA (see 6,365).—During 1909-21 the old geographical name of Cilicia came again into familiar use, chiefly in connexion with Armenian matters. The ancient district of Cilicia covered nearly the same territory as the medieval kingdom of Lesser Armenia, and the present population includes a considerable Armenian element. This portion of south-eastern Asia Minor, therefore, forms a link between Armenians as a region which should form part of an independent Armenian republic and an administratively protected Armenian state until the greater project can be realized. Unhappy events in recent Armenian history have been enacted in Cilicia, largely owing to Armenian aspirations; thus convenient usage has linked the ancient name with the fortunes and tragedy of the Armenian race. Cilicia of present Armenian interest includes the Turkish vilayet of Adana, the independent sanjak of Mar 'ash, and the sanjak of 'Antib in the vilayet of Aleppo. In these areas there were, in 1914, about 175,000 Armenians, while the population included some 500,000 Moslem and other elements.

The recent history of Cilicia belongs, in the main, to the history of the Armenian people (see Armenia). In 1909 the Adana massacres—destructive of hopes created by the Turkish Revo-

cution of 1908—extended over the whole of Cilicia during 1915-6 massacres and deportations organized by the Young Turk Government destroyed or removed the greater part of the Armenian population—including the 20,000 inhabitants of Zeitun, an Armenian mountain stronghold, never hitherto entirely subdued. In 1918-9 Cilicia was occupied by British troops after their conquest of Syria, but on being evacuated by them passed under French control. Subsequently the Treaty of Sèvres was signed to France the southern portion of Cilicia, as far westward as the left bank of the river Jihan, as part of the mandated territory of Syria. The remainder of Cilicia was brought within the French sphere of influence in Apr. 1920 as the Treaty of Sèvres, executed at the same time as the Treaty of Sèvres.

Under French occupation Cilicia received a large immigration of Armenians owing to their reliance on French protection and the hope—apparently without much foundation—that a Franco-Armenian state would be created. The province was the scene of continued warfare between French troops and Turkish Nationalists during 1920, in the course of which the Nationalists gained several successes, and were able to renew the massacre of Armenians on a large scale. In the spring of 1921 an agreement was signed on behalf of the French and Nationalist Governments whereby France was to evacuate Cilicia, and the southern frontier of Turkey, as defined in the Treaty of Sèvres, was to be retired toward about 30 miles on either side of the Gulf of Alexandretta to the frontier of Mesopotamia. These proposed territorial concessions by France the Great National Assembly at Angora considered inadequate, and in consequence it refused to ratify the agreement; and in September 1921 France, therefore, still remained in occupation of Cilicia. (W. J. C.)*

CINCINNATI (see 6,370).—During the decade 1910-20 the area of Cincinnati was extended from 44 to 72 sq. miles. The pop., in 1920 was 401,247, as compared with 363,591 in 1910, an increase of 37,656, or 10.4%. In 1920 the city possessed parks covering 2,601 ac., including the Mt. Airy Forestry project which embraces 1,132 ac.; and a plan was being carried out for further extension by utilizing the boulevards and bluffs. Its 3,611,000 persons, some of which are discussed on the various pages. The city, presented to the city by Mr. and Mrs. Charles P. Taft, was unveiled in Lytle Park in 1916. The city was building in 1921 a rapid transit loop at an initial cost of $6,000,000, which with subway, surface and elevated railways will encircle the city, provide access to inter-urban traffic and relieve congestion. The traction roads were being operated under a service-at-cost contract.

Manufactures.—In 1919 there were more than 2,200 manufacturing establishments in Cincinnati proper, covering 90 establishments, with capital stock of $230,000,000; employed 70,000 persons, paying $600,000,000, employing 112,000 persons of whom one-fourth were females. The five most important industries in the Cincinnati district are soap and soap products, 210,000,000; foundry and machine-shop products, 210,000,000; slaughtering and meat packing, 45,000,000; clothing (men and women), $35,000,000; printing and publishing, 30,000,000. In 1916 the freight movement by boat was 1,471,149 tons, of which 1,539,000 were receipts. The chief cargoes were coal, stone and sand, lumber and grain.

Government.—A new charter was adopted on Nov. 6, 1917 providing that the city "shall have all the powers of local self-government and all other powers possible for a city to have under the state constitution. The mayor and council were to be elected for a term of four years, the chief executive offices to be filled by appointment of the mayor. The charter provided for a city charter, and the election of the mayor. The charter, the director of public service, the three park commissioners and two citizens. It was to submit recommendations for new streets, subways, bridges, playgrounds and parks. In 1919 an ordinance was enacted forbidding the erection or maintenance of billboards within any residential block without the written consent of the
owners of the majority of property on both sides of the street. In 1920 the city's aggregate receipts, including balances on hand, were $24,346,445 and disbursements $27,330,791 leaving a cash balance, principally on account of the public works, of $7,016,645. The valuation for that year was $37,472,310. The rate of taxation was $20.02 per thousand. The municipally owned waterworks and the Southern Railway, also municipally owned, were more than self-supporting. As the net debt not self-supporting on Dec. 31, 1920 was $37,887,482.

Education and Charity.—In the decade 1910-20 extensive additions were made in the Jewish, Catholic, Protestant, and to the tuberculosis sanatorium. The General Hospital with its group of 24 buildings, occupying 27 ac. and considered the best example of the pavilion type on the continent, was financed by a large donation of $1,500,000. Its capacity in 1920 was 850 beds. It is under the administration of the university of Cincinnati, whose medical school adjoins it. Other new buildings and departments of the university (3,595 students in 1920) included the law and business school, a school of commerce, a school of engineering, a school of teachers, the training school for nurses, the school of household arts, a department of hygiene and physical education, a new gymnasium and athletic field, evening departments, and a woman's building. The cooperative system, originated in Cincinnati, of supplementing college instruction by practical training in various shops and manufacturing establishments, was greatly expanded between 1910 and 1920. Several new high-school buildings were erected, with improved class-rooms, laboratory, and gymnasium facilities which served to complete an educational system which carried the student at public expense from the kindergarten through the high-schools of the municipal university. The total expenditures for 1920 were $4,749,605. The enrolment of the day schools was 1,714 and night schools, 14,864, with 1,625 teachers in 70 school buildings, including 5 high schools. The principal expenses for 1920 were: $212,946,300. In 1915 the Roman Catholic University of the Province of St. Francis Xavier in 1919 removed its college department to a 26 ac. tract in the suburbs adjoining the newly-developed Boulevard of the City and constructed administration and science and recitation buildings. The colleges of music increased in buildings and faculties; and in 1915 the Cincinnati Symphony Orchestra received an endowment of $1,000,000 as a bequest from Cora M. Dow. Of special importance was the recent establishment of the American House for the training of aliens for citizenship, and for social service work.

World War.—During the World War Cincinnati supplied 1,200 men to the Marine Corps, 1,400 to the navy, and 15,000 to the army. To the Liberty and Victory Loans Cincinnati subscribed $9,545,945.

CINEMATOGRAPH OR MOTION-PICTURES (see 6,372).—The word "cinematograph," frequently shortened to "cinema," designates primarily the mechanism by which motion-pictures are projected on the screen, but the term has come to be used generally to refer not only to the entertainment but to various phases of its production. In the United States, the designation "motion-picture" or "moving-picture" (colloquially, "the movies") is much more frequently used, though "photoplay," referring specifically to dramatic compositions, is commonly employed.

In 1910 the cinematograph as a means of entertainment was making its first bid for public favour; it was still a novelty, and many persons, including experienced showmen, thought its appeal would decline as soon as the novelty had been thoroughly exploited. Before 1920, however, it had become by far the most popular form of commercialized amusement throughout the world. The production of motion-pictures on a large scale was in 1920 confined to a few countries, chiefly the United States, Great Britain, Italy, Germany, and France, but their exploitation was world-wide. Their appeal was apparently limited by no ordinary conditions of age, race, or degree of civilization, and it is safe to say that a little grandiloquence perhaps, that is all, had constituted the one general law. In 1920 it was estimated there were throughout the world at least 40,000 cinema theatres, of which perhaps 17,000 were in the United States, 5,000 in the British Isles, 3,200 in Germany, 2,700 in France, 1,000 or more in Italy, 1,000 in Spain, 800 in Australia, 700 in Sweden, 600 in Japan, and 500 in China. There was hardly a country too remote not to have at least a few motion-picture theatres, and occasional films had penetrated where accidental ideas were still regarded with prejudice and disfavour. Constantinople, for example, had 11 cinema theatres, Canton 10, Bangkok 9, Rangoon 8, and Tientsin 6. Such theatres, of course, exhibit American, English or European films almost exclusively. It is perhaps interesting to note that in Constantinople only religious pictures were subject to censorship. In South America the cinema was as popular as elsewhere; Buenos Aires, for example, had 131 theatres, and nearly every Argentine town of more than 1,000 population had its moving-picture palace. In the United States the daily attendance at motion-pictures in 1920 was estimated at a little less than 10,000,000, with a British estimate in 1910-20 that it was a number equal to half the population of the British Isles. To the movement attended the cinematograph twice a week—which would be equivalent to a daily attendance of more than 6,000,000. If this estimate is correct it indicates that the cinema attendance in the United Kingdom practically doubled after 1916-7, when a careful estimate placed the daily attendance at 3,375,000 (see The Cinema, 1917). The same report gave the following analysis of seats occupied in the course of a year (week-days):—

<table>
<thead>
<tr>
<th>Price of seat</th>

(This tabulation is based on an estimate of 4,900 theatres with an average daily attendance per theatre of 750. In 1917 the price of seats had begun to go above 1s.; in 1920 in London it was frequently 2s., 3s., and higher in the best houses."

From the business point of view remarkable progress was made during the decade 1910-20. In the United States, where the industry had reached its highest commercial development, the gross receipts of all exhibitors in 1920 were placed at $80,000,000 (as against $675,000,000 in 1918 and $65,000,000 in 1907). The price of admission was usually from 25 to 50 cents; in small towns or poorer neighbourhoods it was sometimes less, while the best houses in New York frequently charged from $2 to $5.

U.S. Government statistics show that the total gross income of American motion-picture producers (manufacturers) was about $90,000,000 annually. Capital invested in the producing business was estimated at $100,000,000, while the amount of positive film ("camera") each week was said to be $10,000,000. The estimate of $3,000,000,000 for the future trade is based for the most part on figures from an American, 1919. 1918

The outbreak of the World War favoured the growth of the industry in the United States to such an extent that it became by far the leading producing country in the world. In most European countries, as well as elsewhere, the majority of films displayed after 1915 were of American origin. About 75% of the films shown in Great Britain in 1920 were of American manufacture. The extent of American exports in that year is indicated by the following table:

(The figures above are for 1919, and for 1918 the increases are 50%.)
European production, however, was beginning to regain lost ground; artistically the best European work was not infrequently superior to that produced in America. Germany's recovery seemed particularly rapid; this was due in part to legislation prohibiting the importation of American films, and even after that the introduction of foreign films was to be strictly limited. In England producers were making great efforts to meet American competition, though without the aid of legislation. The manufacture of motion pictures in Great Britain, however, was not greatly affected by the handicap of a climate which, being often dull and lacking in sunlight, was not well adapted to photography. This handicap was partly overcome by means of artificial light. Good receipts from all cinema theatres in the British Isles were estimated in 1920 to be about £35,000,000 annually. Data for other countries were lacking; in France, however, the official statistics for Paris show that in 1920 a total of 3,470,000 francs was distributed to the performers, the latter being paid from a salary ranging from 5,000 to 10,000 francs. Even these figures were surpassed in the case of a few of the best-known popular favourites; thus, the film "The Egyptian," which starred Estelle Taylor, for example, was said to be £1,600,000 (1920). After 1920 the influence of conservatism on the part of the investors was beginning to make itself felt, and there was a tendency to reduce salaries and to introduce other economies. It was seen that this new influence would make for greater stability in the industry and probably for better pictures.

**Mechanical Progress.**—The popularity of the moving-picture led to much research on the determination of the most efficient and the difficulties were not altogether removed. Charles Urban of Thomas Edison (see his letter to the New York Times, June 9, 1921) that the honour belonged to him. It is true that the modern cinematograph was evolved out of Mr. Edison's kinetoscope, or kinetograph, though these devices likewise owed a great deal to earlier experiments. But the prototypes of the modern projecting machine seem to have been produced by others—apparently by three men: Louis Lumière in Paris, R. W. Paul in London and C. F. Jenkins in Washington, D.C., each of whom was engaged virtually at the same time (1894-5) on the new invention. Their efforts were not unimportant, and the cinematograph of 1920 had not changed greatly from the machine of 25 years ago. When, relying on the well-known psychological principle of persistence of vision, it was first made a practical device for reproducing "animated pictures" on the screen. In matters of detail, however, great improvement had been made.

An important advance was the adoption of a standard film, 13 in. in width, with 16 pictures, sometimes called "frames," each by 1 in., to every foot of film. Near the margins of the film, on either side of the pictures, are sprocket holes two means of which the strip of miniature photographs is run through the projector at the rate of approximately one ft. a second, about the lowest practicable speed to give a satisfactory illusion of motion. On the reel used at the New York exhibition of 1921, 1,000 negatives were wound on, and the projector of the old system required a "flicker" in the term "red," thus came into use as a unit of measure. The elimination of "flicker," which caused much annoyance in early cinematograph exhibitions, was brought about by incorporating a mechanism which draws each succeeding picture momentarily into place and partly by increasing the number of revolving shutter blades from one to three, of which one serves to cut off the light while the second and third exposed and projected the screen. Vats and tanks, coming out coloured, dried and ready for exhibition through the ordinary projection machine. The production of the negative is a complicated process, and it remained to be seen whether it would be sufficiently simplified and made sufficiently rapid to meet the demand. However, it seemed to approximate the requirements of an ideal colour film, which should consist of a series of pictures, each a complete negative representation of the picture, to be exhibited on any machine at a normal speed. Despite the progress made in colour photography the majority of films displayed in 1920-1 were still in black and white, or in some monochrome tint in which the lights could be obtained by exposing a colour screen in front of the projection lens. Some colour films were made by an adaptation of the hand process in which the colouring is done with the aid of stencils.

The first colour film had preceded the moving-picture by about 18 years; it was natural, therefore, that efforts should be made to synchronize the two in order to produce talking pictures. Encouraging results were obtained by Leon Gaumont in Paris as early as 1910, and two years later by Tlomas A.
Edison in America. The usual method was to make the phonograph record first, the actors merely speaking their lines into the gramophone without attempting to pose before the camera. Rehearsals were then necessary to enable the actors to fit their actions to the record; and the dialogue was often adapted creatively. Later the idea of synchronizing the phonograph with the film was abandoned, and the remaining problem was to ensure a synchronization in the theatre of the phonograph and the picture. This was accomplished by means of electrical devices; New York the sound waves are transferred, by means of microphones, to a circuit containing a sensitive string galvanometer, and the fluctuations of the string or wire of the galvanometer are recorded photographically on the side of the film. When developed one side of the film shows a series of peaks resembling the profile map of a mountain range. Reproduction is accomplished by the use of a selenium cell placed in front of the moving film; the sound waves are then conveyed electrically to the rear of the screen and disseminated through loud-speaking telephones. The cinema industry showed comparatively little interest in vocal pictures and their future was uncertain. Another problem which engaged the attention of inventors concerned the discovery of some method of obtaining stereoscopic effects on the screen. One solution of the problem failed of success because, in order to complete the illusion, every spectator was required to wear a pair of special spectacles; most producers were not only reluctant about putting them on but took little pleasure in the result, even though the effect was superior to that of a flat picture.

Recreational Aspects.—Improvements in apparatus, while important, were overshadowed during the decade 1910–20 by the truly remarkable achievements in developing the artistic, educational and recreational possibilities of the cinema. It is true that in 1910 the cinema had begun to outgrow that early period when its repertory consisted largely of express trains, automobile races, military parades and like subjects. The first step had been taken, and efforts were now aimed at the development of new forms of entertainment. The express train, for example, suggested the pictorial possibilities of a train robbery, and a story was invented to give the scenes continuity and culmination. Then the story became the chief thing. But the development in the cinema of the story-telling art was hindered by the circumstances of its early exploitation. The pictures of that period were exhibited either as part of vaudeville entertainments, where they took the place of the usual feats of legerdemain, or in cheap halls that had been converted from other purposes; the latter were usually dark, ill-ventilated and far from clean. Every circumstance of their presentation tended to detract from the customer by the better interests of his community. Yet their cheapness—the admission price was usually five cents in the United States and fourpence, or less, in England—attacked thousands of people for whom no amusement of so absorbing a character had ever been provided at so small a cost. Wherever the moving picture was introduced similar conditions prevailed; the initial appeal was almost uniformly to the juvenile, the half educated, and even, as it seemed, to the mentally incompetent. Probably no art ever developed under so great a handicap; the result, still obvious in the crudity and vulgarity of much modern film, was the degeneracy of the medium rather than to the unhappy conditions of its origin. But it was not only the character of those early audiences which left its impress on the cinema art; it was also the character of the men who engaged in this new industry. They were for the most part showmen of the itinerant, hand-to-mouth type, promoters and managers of the cheapest forms of vaudeville entertainment. Some of them remained exhibitors only; others began to assemble companies and produce motion-pictures. While many persons of intelligence and ability had been attracted to the industry by the end of the decade, not a few of the most influential men in the business were those who had been carried to success by the sheer momentum of the new art; they were survivals of that early group ofshowmen whose hope of profit lay in exploiting the crudest instincts in the most obvious fashion.

Yet in estimating the social influence of the moving-picture, even in that early period, it would be a mistake to overlook the fact that in many localities the cinema afforded the only effective competition with the amusements of the saloon and public-house. However bad the pictures were, and they were usually aesthetically rather than morally reprehensible, nevertheless they were a positive benefit in comparison with many types of amusement that were open to the poorer classes. When the workingman's family began to insist that they take them to the moving-picture palace of an evening he found it more difficult to offer an excuse for going to the bar. With the advent of prohibition in the United States the motion-picture interests profited greatly; the cinema then became one of the most effective substitutes for the liquor saloon.

It is not surprising that for an appreciable interval many actors who had achieved fame on the stage refused to act for the "movies." Cultivated opinion was inclined to scorn if not to denounce the photoplay. For a time it seemed improbable that the moving-picture could ever be lifted above the vulgarity of its origins. The cinema seemed to be held in a vicious circle; exhibitors were afraid to raise the admission price, yet the fee was too small to pay for a better theatre or to justify spending more money for better pictures. Between 1910 and 1912 attendance actually began to fall off; even the public whose attention the "nickelodeon" had obtained, was not content to challenge, appeared to grow tired of what, after all, was only an attempt to compete with the old-fashioned "dime novel" and "penny dreadful." A few far-sighted producers perceived that radical measures must be taken if the commercial possibilities of the motion-picture were to be advanced beyond those of a third-rate vaudeville attraction. The first step was to break down the prejudice of recognized artists, for as long as the cinema was held to be an object of ridicule, beneath the dignity of persons of artistic or cultural pretensions, it was hopeless to try to interest the public at large in the new art. An American producer accordingly set about to prove that Sarah Bernhardt to appear in moving-pictures, his theory being that if the best-known living actress should in this way give her sanction to the cinema the rest would be easy. Mme. Bernhardt, it is said, was won over on the plea that she ought to leave future generations some permanent record of her great art. The result marked something like an epoch in the history of the motion-picture; the old-time prejudice began gradually to give way, and the cinema, now certain of its ability to pay high rewards to popular actors, was soon attracting some of the best theatrical talent. Money was lavishly spent on huge productions that often cost a fortune, and a finished picture was likely to cost from $100,000 to $200,000 instead of from $10,000 to $20,000 as formerly. The Bernhardt films—Camille and Queen Elizabeth—were followed by such productions as Quo Vadis, Les Misérables, Tess of the D'Urbervilles (with Mrs. Fiske), the Italian film Cabiria, written especially for the cinema by Gabriele D'Annunzio, and The Birth of a Nation, produced by D. W. Griffith. Cabiria and The Birth of a Nation deserve especial notice aside from their excellence as dramatic spectacles, because it was with these films particularly that the fine elements of the old-time dramatic theatre; not only were they presented with full orchestra accompaniment in theatres hitherto given over to the spoken drama, but admission prices were raised to the highest scale for Broadway or West End productions. The success of these ventures had the effect of raising the standards of the cinema theatre in every direction; better theatres adapted solely for motion-pictures were built, permanent orchestras installed, prices increased, undesirable patrons barred; and exhibitors who had formerly looked for support from the rill-rail of the town discovered it was more profitable to appeal to the less impecunious and more self-respecting classes of the community.

There followed a period of keen competition with the legitimate drama. In many communities the motion-picture entirely usurped the place once held by the older art. Many
stock companies were forced out of existence, while the prospect of making a profitable tour with a metropolitan success was rendered more and more precarious.

An American dramatic critic has cited the case of his home town, Pittsfield, Mass., a city of 40,000 pop., and the situation there was not at all unusual. What was happening all over the United States and elsewhere as well. Before the advent of the motion-picture, Pittsfield had one theatre devoted to the legitimate drama, and at the top of a building or to the rear of the new and properly magnifying landscape, it had attained success on Broadway. But the cinema changed all that; the one legitimate theatre was transformed into a motion-picture palace, and four new "movie" theatres were opened. Friends of the cinema urged that the casualties were not a general phenomenon, and the argument was met by elaboration of the thesis that the influx of the new art was merely an experimental period, the onward sweep of the new art were on the whole richly merited.

Certainly the grave apprehensions once entertained for the future of the dramatic art were ill-founded; it was natural that the new art should be accompanied by a period of transition, and usually inferior grades of theatrical production, but it became equally evident that each form of dramatic story-telling had its place, and neither one, if properly conducted, need fear the other. It might even be urged that in some respects the competition produced a beneficial effect on the stage. The alleged menace of the cinema came into prominence in a new form in 1910 when an American film company (Famous Players-Lasky) purchased the theatrical business of Charles Frohman, Inc., which included control of the Empire theatre in New York City. It was assumed that this invasion of the legitimate stage might result in making the legitimate drama the sport of beer-garden amusement. The author of the assumption was shown to be in error by photographing a series of drawings, each showing a slight advance over the other. In the earliest examples as many as 8,000 separate scenes were made for each film. This system, as it evolved, was extremely slow and laborious. Later methods were developed whereby only moving parts of the picture were redrawn, and in this way the number of drawings could be reduced to less than one thousand. Even with this simplification a staff of artists was required to complete an animated drawing or cartoon, and the artist to whom it was attributed rarely did more than furnish the outline of the story or a few preliminary sketches. The method employed in making animated cartoons was soon adapted to other subjects; it was found of particular value in illustrating new inventions, or in depicting the operation of certain kinds of mechanism too intricate to be easily photographed from original models. The reasons for the predominance of foreign pictures were due partly to the almost ready availability of pictures photographed through the side of a glass tank. In 1913, however, the so-called submarine tube, which had been devised to lower the cost of the making of animated pictures, was adopted for cinema photography, and the first actual submarine pictures were taken by this means. The undersea scenes of Jules Verne's Twenty Thousand Leagues Under the Sea were filmed, and later some remarkable pictures were made of divers lighting with stars. Interesting cinema views were also obtained of many varieties of ocean fish and submarine plant life.

Educational Use.—With the development of cinema technique it came to be seen that the moving-picture might be used as a valuable aid to education. The hopes of many people that the commercialized cinema would undertake this work on a large scale were of course not realized. Nevertheless, in most cinema theatres it became customary to exhibit excellent pictures of current events, travel, or similar subjects in addition to the standard programme. This practice was even more valuable, and the educational value of such pictures should not be overlooked. The British Cinema Commission of Inquiry found that, other conditions being equal, the fund of general knowledge possessed by children who frequently the pictures is far wider and far richer than that possessed by those who do not. This information covered a wide range, including facts of geography, literature, natural science, industrial processes, social life, current events, etc. Moreover, the ideas formed from a moving-picture were often demonstrably more accurate than those which the children had previously acquired from an oral or printed description.

It is obvious that this information is not merely incidental which is concerned primarily with visual impressions, the motion-picture is greatly superior to any other form of instruction. Words are only an inadequate substitute for pictures in giving correct ideas of landscape, natural or mechanical processes, foreign customs and the like. For this reason, a ten minutes in a motion-picture theatre will often give a better grasp of such subjects than several hours devoted to text-books. Knowledge acquired in this way has a vividness and an interest that do not attach to other forms of instruction; consequently it is acquired with less mental friction and with less
CINEMATOGRAPH

likelihood of its being forgotten. During the World War, the Governments engaged in that conflict produced thousands of war pictures to encourage enlistment and keep up morale; and the cinema proved itself to be one of the most potent methods of propaganda in reaching the mass of the people. Films taken on the battle-field, moreover, will acquire more and more historic interest as time goes on. Such pictures, displayed in connection with pictures of the soldiers at any colleges, have a value above mere entertainment. Practically all Governments, therefore, provided special archives for preserving motion-picture films, especially those dealing with military subjects. The taking of pictures of current events was developed as a special branch of the motion-picture industry. Certain companies perfected organizations with cameramen acting as their representatives all over the world, and facilities were provided for the rapid transportation and development of news films. These companies began to compete to get their pictures into the theatres at the first possible moment, and motion-pictures of important events were frequently exhibited within an hour or two after the event had taken place. Sometimes pictures showing earlier phases of a prize fight, an inaugural ceremony or occurrence of like nature were displayed even while the event itself was still in progress.

The U.S. Government was probably the first to use the cinematograph for the purpose of disseminating agricultural information among farmers. In 1920 the Department of Agriculture had in circulation approximately 100 cinema pictures showing such subjects as *How to Select a Laying Hen* and *The Story of Cotton*. The films were produced under Government supervision and developed in Government laboratories, which then had a capacity of one reel a week. Towards the close of the decade many private institutions were also undertaking the production of moving-picture films for educational purposes, and the installation of projecting machines in schools and churches was becoming rather general. In 1920 there were in the United States 1,500 schools, universities, and similar institutions so equipped, while more than 2,000 had arrangements with local theatres for the exhibition of pictures of special value in connexion with educational work. About 2,000 churches occasionally showed moving-pictures either at the church proper or at some outside place under church supervision. In order to supply schools and churches the "film library," devoted largely to educational subjects, was developed and gave promise of serving a need analogous to that supplied by the circulating library of books. These libraries were first instituted as commercial enterprises, but in the United States in 1920 there was at least one organization which supplied films gratis to institutions that offered to exhibit them free of charge.

*Censorship and Regulation.*—A demand for the regulation, supervision and censorship of the cinema theatre arose very soon after the film began to be used for narrative and dramatic purposes. Regulation was first concerned with construction of the theatre, the elimination of the fire hazard, and the supervision of stage doors; it then came to be felt that the chief danger lay in the pictures themselves. Society workers in nearly every country conducted an agitation for a censorship that would prevent the showing of objectionable pictures.

One of the first countries to establish a national censorship was Sweden (1911); other countries soon followed—Spain (1912), Italy (1913-4), France (1916). Censorship was also instituted in Russia and Japan; in the latter country the prohibitions included anything that "contradicts morality and consequently the principle that good brings its own reward and evil its own punishment.

In Britain the Cinematograph Act of 1909 provided for the licensing of cinema theatres but not for censorship. As a result, however, of the discussion incident to the importation, chiefly from France and America, of certain objectionable films, the Cinematograph Exhibitors' Assn., with the approval of the Home Secretary, established an independent Board of Film Censors. Exhibitors were not of course obliged to accept the decisions of this Board, yet before the close of the decade 1910-20 more than 97% of the films exhibited in the British Isles were first reviewed by the Board of Censors.

In 1920 the Cinematograph Exhibitors' Assn. adopted a resolution providing for the expulsion of any member who refused to accept the censorship of the Board. It might have been expected that such censorship, in view of its close connexion with the trade itself, would prove careless and ineffective. It was, however, the opinion of the Cinema Commission of Inquiry, which conducted a public inquiry into the working of the censorship in the United States, that the work of the Board was for the most part conscientious and commendable. This commission had been instituted by the National Council of Morals; its report, *The Cinema*, already referred to, is a valuable source on many aspects of the moving-picture industry. One of its conclusions was the recommendation of a State censorship, largely on the ground that the authority of the State could be exercised more effectively than by an independent board. Testifying before the Commission, T. P. O'Connor, the president of the Board of Censors in 1916 (following the death of G. A. Redford, his predecessor), stated that films were censored with the promise of a series of films, and noted that the 45th number, of which the following are typical: "Indecorous, ambiguous and irreverent titles and sub-titles. Irreverent treatment of sacred subjects. The modus operandi of criminals. Cruelty to young infants and excessive cruelty and torture to adults, especially women. Nude figures; impropriety in dress or conduct. Gruesome murders, strangulation scenes, executions. References to controversial politics. Subjects dealing with the drug habit, white slave traffic, race suicide, etc. Sexual relations, suggestive or suggestive of incestuous relations. Scenes tending to disparage public institutions or characters. Materialization of the conventional figure of Christ."

Besides showing much good sense, these prohibitions indicate to what lengths even a moderate censorship can go; if logically applied such rules would bar many of the plays of Sophocles, Shakespeare and Ibsen.

The British Board of Censors exercised no control outside of the British Isles. In Canada, in 1920 each province had a board of censors appointed by the lieutenant-governor in council; in general the censorship was very rigid, but the fact that a film had been approved by the authorities of Ontario, for example, no guarantee that it would be passed by the board in Quebec, or vice versa. Elaborate regulations for censorship were adopted by New Zealand in 1916, and in 1920 State censorship of films existed in many parts of the British Empire, including India and New South Wales.

In the United States, a non-official censorship, subsequently known as the National Board of Review, was instituted in 1909 by the People's Institute of New York. Its review committee (unpaid) was in 1920 composed of 140 representatives of citizens, many of whom were engaged in social welfare work. The American Board, unlike its British counterpart, had no direct connexion with the cinema industry; its revenues were derived in part from contributions and in part from a flat charge of $6.25 (1920) per reel which was assessed against the producer for the review of his pictures. In 1920 nearly 6,000 reels were so reviewed, representing, it is said, more than 90% of the films exhibited in the United States. The censorship exercised by the American Board was on the whole noteworthy for its enlightened character, but while the Board won support in many communities, there were others which seemed to think its supervision was either too lenient or not suited to local needs. By 1921 six states—Ohio, Pennsylvania, Maryland, Kansas, New York and Massachusetts—had established official censorship boards, and agitation for similar laws was in progress in many other states. Certain groups were also advocating a national board of censors to be appointed by the president. National laws to 1921 consisted only of general prohibitions against the shipment of improper films in interstate commerce, though in 1918 the Secretary of the Treasury was empowered to censor imported films.

For the most part, the cinema industry strongly opposed the extension of laws for official censorship of motion-pictures, and the objections put forward were often well founded. For people of the Anglo-Saxon tradition it is hard to justify the establishment of a bureaucracy for the control of expression by means of censorship, whether the medium be the press or the stage. It should be said, moreover, that opposition to censorship by no means involves a covert desire for licentious pictures; even without censorship the exhibitor is fully responsible for the films he shows. Licentiousness removes the opportunity to show improper films; it is
preventive. Its great danger is that it may become rigid and arbitrary. Special reasons, however, were advanced why in the case of the moving-picture preventive action should be taken. One of these was that the public at large, that is, the entire population of the world, was at the mercy of an extraordinary minority of children, who comprise a large percentage of the average neighbourhood audience. But it could be answered that if the cinema was ever to become a mature, adult art form, it should be judged by standards of what might and might not be good for children. The best solution here seemed to lie in providing special performances for children; no good reason appeared why children should be encouraged or obliged to go to pictures different from those attended by adults. A better plea for censorship was that the industry, having arisen in less than a quarter of a century, was still in a formative condition, without adequate a mature and an adult element. But it was argued that censorship was necessary not only to protect the public but to protect the producer against his inability to perceive his own best interests. Such an argument clearly anticipated a period when censorship would be unnecessary; unfortunately experience points to the difficulty of abolishing any kind of bureaucratic agancy when once it has become established. The continued existence of the British dramatic censorship, despite very great efforts to modify its powers, affords an excellent illustration of the tyranny of Government bureaux. It should be noted also that in the United States the censorship laws seemed to be designed partly as revenue measures, which of course still further entrenched them against attack. For these reasons the voluntary censorship undertaken by the Board of Film Censors in England and the National Board of Review in the United States would on the whole seem preferable to other methods of legislation. In this connection the following letter from the official statement of the American Board is significant: "The National Board's standards ... are of course, progressive and will change with the lapse of time ... becoming more ideal as the movie grows older and emerges confident of its new art. Moreover, the increased experience of the producers, the development of motion-picture artists, the classification of the theatres, the influence of more cultivated audiences, and the popular acceptance of the motion picture as an art which is even now in progress, will in time bring about conditions so different from the present that regulation may perhaps not be necessary."

Artistic Value.—The close of the decade was marked by various controversies as to whether the cinema could be classified as an art. That discussion was in itself a valuable indication of the improving status of the moving-picture; ten years earlier the cinema was either ridiculed or ignored. Later critics very naturally sought to establish their case against the cinema on the obvious fact that a majority of the films were crude and childish, mostly slapstick farce and sentimental melodrama; but an argument evolved in this fashion has little to commend it; doubtless in the England of the 17th century it seemed equally impossible that the crude mystery and morality plays of the day should ever give rise to distinguished art. Yet these crude efforts were the precursors of the drama of Marlowe, of Jonson and of Shakespeare. This is not to say that friends of the cinema are looking forward to a Shakespeare of the films; the artistic values that can be achieved in the motion-picture are not commensurable with those which pertain to the written drama. What is contended is that, considered solely as a method of telling a story, the motion-picture is capable of achieving highly artistic results. Even sentimental melodrama, as produced in the cinema, became a more artistic type of narrative than the old popular melodrama of the stage. But the best producers were not content to have made only this degree of progress, and their finest achievements at least foreshadowed the development of singularly beautiful and expressive art.

Action and setting constitute the chief means of this art, and in both elements it has advantages over the older forms of narrative. The cinema can present action more successively than the novel and hardly less effectively than the drama. In the case with which it can represent and control the element of setting it has an extraordinary superiority over the novel and drama, though its possibilities in this direction were only beginning to be appreciated. Some writers, notably Prof. Hugo Münsterberg in his interesting study, *The Photoplay* (1916), insist that the essence of the new art lies in its ability to triumph over the ordinary limitations of mundane existence. "The photoplay," says Münsterberg, "tells us the human story by overcoming the forms of the outer world, namely, space, time and causality, and by adjusting the events to the forms of the inner world, namely attention, memory, imagination and emotion." The plasticity of the motion-picture medium, its freedom from merely conventional restrictions of time and space, undoubtedly give fresh scope to the imagination and the power to weave new patterns out of the materials of existence. Possessing these advantages, the cinema lacks the means to tell any appreciable part of its story in words. Failure to appreciate the artistic possibilities of the moving-picture often arose from a failure to perceive that it must be regarded as a form of art which is not, as a rule, capable of expressing essentially literary forms, particularly the spoken drama. It is not a literary art. It cannot rely on literary methods. This explains the lack of success that attended the efforts of many literary men, novelists and dramatists, to use this new medium. Its central purpose, namely to arouse emotion, is identical with that of the spoken drama; it is perhaps more amenable to fundamental laws of dramatic composition than many producers and directors seemed to realize. But in most respects it differs more widely from the accepted dramatic form than Shakespeare differs from Sophocles or Ibsen from both. In virtually surrendering dialogue, the motion-picture surrenders a form of art in which the dramatist relays, not for the presentation of character and the clash of character; it follows that a scene representing mental conflict, for example, must either be inadequately represented in the moving-picture or expressed in a different way.

For this reason, the production of a successful motion-picture play makes the very highest demand on the skill and imagination of the scenario writer, the director, and the actor. In the composition of the scenario every scene and every element of the scene must possess an expressiveness which is quite unnecessary where words can be used to cover defects of action or setting. The art of suggestion must be pushed far beyond the conventional limits of the legitimate stage; an attitude, a look, a gesture, a bit of pantomime must be made to tell as much as pages of dialogue. There is no reason to disparage such a method; in ordinary life we discern the nuances of a man's character or of his expression in a single look. Such expressions are told by the person himself; the light in the eye often illuminates the mind better than the spoken word. Setting, also, may be made to reflect character; it may show the world as the protagonist of the dramas himself sees it, sometimes twisted and distorted, sometimes fair and alluring. Here at least is an opportunity to do what the legitimate drama could never do. Setting likewise may advance the plot; as Otis Skinner points out, sometimes a glove, a pistol, an empty chair, will tell a better story than action. To a much greater extent than the drama, the successful motion-picture requires the coordination of the efforts of the author, the actor and the producer. The author must have an exact idea of what he wishes to produce on the stage, but a moving-picture scenario is the barest of skeletons before it is acted in front of a camera. The photoplay is thus a composite art, almost equally dependent on its various elements. Perhaps the most advanced work in the decade 1910-20 is in achieving a successful coordination of these elements, but no completely adequate method or procedure for securing this result had been evolved, so that good acting was frequently wasted on ridiculous scenarios, while good stories were made childish by incompetent direction.

Film Actors.—In an art so new, it is not surprising that the greatest reputations were made by actors whose appeal to the public is less a matter of circumstance than that of the scenario writer or the director. By reason of the extensive popularity of the motion-picture the names of Mary Pickford, Douglas Fairbanks, and Charles Chaplin had a renown that was no less than world-wide. Miss Pickford (family name Smith) was born in Toronto, Can., April 8 1893, the daughter of a character actress. She made her début on the stage at the age of five, but her first marked success was in motion-pictures, and she afterwards appeared as leading woman in many highly successful photoplays, among them *Tess of the Storm Country*, *Cinderella*, *The Cradle of the Race*, *Cricket*, *Sunny Side Up*. In many she typified the charm of innocent girlhood. On March 28 1920 she married Douglas Fairbanks. She was in 1920 head of the Mary Pickford Film Company. Fairbanks, who was born May 23 1883 in Denver, Col., attended for a time the Colorado School of Mines. He appeared in a minor rôle on the New York stage in 1901; later he was "starred" in several comedies and musical pieces, after which he left the stage for motion-pictures, where his engaging smile and athletic prowess stood him in
good stead. In 1916 Fairbanks organized his own producing company. At the age of seven Charles Spencer Chaplin (born in 1888 near London) first appeared on the London vaudeville stage. A piece called *A Night in an English Music Hall* brought him to the United States, and in 1913 he became a cinema actor for the Keystone Film Co., under whose auspices he quickly showed his genius for comedy, though his early roles were principally those of the inebriate clown, borrowed or imitated from the vaudeville stage. In succeeding years he performed in motion-pictures for the Essanay Co., the Mutual Film Corp., and the First National Exhibitors' Circuit; it is stated that in 1920 more than 2,000,000 feet of film were made for him by the studio for making eight two-reel pictures. He afterwards constructed a motion-picture plant at Los Angeles and undertook the direction of his own pictures.

Before the invention of the motion-picture the art of acting was perhaps the most ephemeral of the arts. We have been told that David Garrick, for example, was a great actor, but we have no means of judging for ourselves. The motion-picture can now give to the actor's art a permanence that is to some degree analogous to that of the printed book. Up to 1921 it was, however, a more conditional permanence, for the reason that cinema film as then manufactured had much less enduring quality than the printed page; a book can be preserved for centuries, but the commercial film of the day was not expected to remain clear for more than 15 years. Films kept longer had showed signs of deterioration and the discontinuous renewal of old films by making new copies was therefore the price of keeping a permanent motion-picture record. Many old films were accordingly allowed to lapse, and it is obvious that according to the part in domestic life which was preserved as the years go by. But with good fortune, some motion-pictures may achieve an immortality comparable with that of the great works of arts or letters. It would be more than hazardous to say that the cinema, in the brief period of its existence, has yet produced any picture which deserved immortality. Still, every one who is interested in this new art would wish to make a few exceptions, if only for the sake of their historical importance.

**CITY GOVERNMENT (UNITED STATES).—Lord Bryce's *American Commonwealth* (1888) may be said to mark the turning point in the consideration of city problems in America. From the end of the Civil War in 1865 to 1885 the United States was engrossed in problems of readjustment, reconstruction, transportation and internal development. Municipal affairs, where not wholly neglected, were at low ebb and in the hands of selfish political organizations, whose interests were wholly those of personal aggrandizement. Lord Bryce's criticism stung the country into consciousness of the shortcomings.

A national conference on city government was held in Philadelphia in 1894, out of which grew the National Municipal League. Its early meetings were devoted to a statement of conditions and to a discussion of the lessons they taught. Publicists and students were not in a position to agree upon a statement of belief, mainly because they had not given to general plans the necessary attention and study; their experience had been purely local. There was no regular form of American municipal government, and the greatest diversity of types, although the general tendency was toward a federal plan modelled on that of the national Government with a division of functions (legislative, administrative and judicial). Out of the League's efforts grew a "municipal programme" the fundamental features of which were that every community should have the right of self-government in local affairs without the interference of outside governmental or party machinery; that the city's public property in land, and especially its franchise rights, should be preserved unimpaired; that all barriers should be removed which prevented the popular will from expressing itself freely and effectively; that municipal administration should be conducted in the main by a class of public servants who by reason of experience and special training were particularly fitted for their official duties; that official responsibility should be so placed, through simplification of governmental machinery and full publicity of accounts, that the people could hold their public servants to the execution of the public will with the least possible delay and uncertainty.

In the year in which this programme was adopted (1900) the Galveston flood nearly destroyed that city. Among other things swept away was the typical old-style mayor and council form of government, which was replaced by a commission of five members appointed by the governor of Texas. This commission worked so swiftly and efficiently, and with so much less annual cost, that, after the emergency passed, an attempt was made to continue it with a commission of five members, three appointed by the governor and two chosen by popular vote. A court decision declared such appointments to be unconstitutional and the entire commission forthwith became elective. To the surprise of many observers, no demoralization ensued, and through successive elections the changes in the personnel were slight. In 1908 Des Moines adopted the Galveston plan, with the addition of the initiative, referendum, recall and non-partisan primary. This broader plan was widely copied, and 482 cities and towns of 2,000 and over by Jan. 1 1921 had adopted it.

The following cities of more than 50,000 inhabitants (census of 1920) were in 1921 operating under this form: Buffalo, N. Y.; Dallas, Texas; Erie, Harrisburg, Wilkesbarre, York, Lancaster, Michigan; Peoria; Reading, Pa.; Jacksonville, Fla.; Kansas City, Kan.; Lawrence and Lynn, Mass.; Newark, N. J.; New Orleans, La.; Portland, Ore.; St. Joseph, Mo.; St. Paul, Minn.; Salt Lake City, Utah, Seattle, Spokane and Tacoma, Wash. There were in the same year cities and towns of 16,000 inhabitants or more under commission government; *Texas* followed with 48; Kansas had 42; New Jersey 38; Pennsylvania 32; Oklahoma 23; California 17; Michigan 17; South Dakota 16; Alabama 13; Louisiana 13; Tennessee 13; Florida 12; Iowa, 11; Indiana, 11; Wisconsin, 10; Michigan, 10; North Dakota and Washington each 9; New Mexico seven; New Hampshire five. The number per state gradually decreased until in Arizona, Connecticut, Maine, Maryland and New Mexico there was one each. There was none in the Northern Pacific, South Dakota, Rhode Island, Delaware, Virginia, Georgia, Indiana, Arkansas, and Mississippi.

Few changes of importance were made in the Des Moines model for several years after 1908 (except the preferential ballot first added by Grand Junction, Colo., 1909) until the appearance in 1913 of the first modification providing for a city manager. Out of this grew a city-manager form of commission government, which the National Municipal League recommended to chartersmen, then multiplying in great numbers due to the growing dissatisfaction with existing conditions. A second "municipal programme" formally adopted by the National Municipal League in 1914, definitely embodied the city-manager plan and later recommended that the council or legislative body be elected on the principle of proportional representation.

The city-manager movement is justly regarded as the best fruit of the movement for better municipal government. It embodies the short ballot, responsiveness to public opinion, concentration of executive power and responsibility, expert administration of city affairs, and elimination of legislative control over the administrative, all essential principles of sound governmental practice. The success of the plan has been abundantly proved, although here and there expectations, because unreasonable, have not been met. Like other governmental agencies it is open to change and improvement, but it stands as the big contribution to political science of the past quarter of a century.

Moreover, its application to an increasing number of cities is developing municipal policies as perhaps no other single factor does. City-planning, zoning, budget-making, the preparation of adequate and carefully designed plans for transportation, intelligent housing, have all been stimulated by the introduction of experts in municipal affairs.

On Jan. 1 1920 there were 203 cities, according to the City Manager Association roll, operating in this form; Michigan leading with 27 cities; California, Texas and Virginia following with each 19 each; Iowa and Ohio 12; North Carolina 9; Florida 8; New York 6; Pennsylvania and Georgia 5. There was none in New Hampshire, Rhode Island, Delaware, Indiana, Illinois, Wisconsin, North Dakota, Nebraska, Alabama, Florida, Maryland, Missouri, and Washington. The following cities with a pop. of 25,000 or more (census of 1920) were in 1921 administered by city managers: Alameda, Pasadena, Sacramento; San Diego and San Jose in California; Colorado Springs, Colo.; Kent, Ohio, and Queenston, N.Y.; Lansing, Mich.; Long Island, N.Y.; Waltham, Mass.; Bay City, Grand Rapids, Kalama, Muskegon and Pontiac, Mich.; Niagara Falls and Watertown, N. Y.; Akron, Ashland, Dayton, Lima and Springfield, O.; Muskege, Oshkosh; Altoona, Pa.; Beaumont, Tex.; Lynchburg, Newport News, Norfolk, Baltimore, Boston, and Roanoke, Va.; and in West Virginia, Charleston and Wheeling.
Home rule for cities, a far cry when Lord Bryce's book appeared, was in 1921 the guaranteed constitutional right of the cities of one-quarter of the states in the Union and bade fair to become the policy of many more. It represented a great gain both for municipal government and for an efficient administration of state affairs. Improvements in the personnel of city officials have not kept pace with improvements in other directions, although substantial changes for the better are everywhere to be noted. There can be no lasting improvement in this connexion until the short ballot becomes an established fact. This change will come less quickly than the others because of the "vested interests" of the great political organizations, which will yield with the greatest reluctance, for the short ballot means the substitution of citizen management for party organization. Whether the latter would ever cease to be necessary was still in 1921 a question upon which there was a sharp difference of opinion. There is no doubt, however, that party ties, particularly in local contests, are far looser than they formerly were. "Municipal affairs" was in 1921 a phrase which included a multitude of things that a generation earlier were not discussed even academically. One has only to study the budget of the present-day American city to appreciate how manifold those affairs have become. Not only numerically but intrinsically they have grown in importance and this constitutes an important feature of the present public interest in them. The municipal activities of American cities are numerous and diversified. Prof. Eugene F. Pams has in summing them up, declared that the following subjects were held to be proper public purposes and proper subjects of municipal ownership and control: "Roads, bridges, sidewalks, sewers, ferries, markets, scales, wharves, canals, parks, baths, schools, libraries, museums, hospitals, lodging houses, poor houses, police, jails, cemeteries, prevention of fire, supply of water, gas, electricity, heat, power, transportation, telegraph and telephone service, clocks, skating rinks, musical entertainments, exhibitions of fireworks, tobacco warehouses, employment offices." The three decades following 1890 witnessed a steady growth toward responsible, efficient democratic government among American cities.

CLARETIE—CLEMENCEAU

CLARETIE, JULES ARSENE ARNAUD (1840-1913), French man of letters (see 6.436*), retired from the administration of the Théâtre Français in 1913. La Vie de Paris was completed in 1913, and published in 21 vols. in 1914. He died in Paris Dec. 23 1913.

CLARK, CHAMP (1830-1921), American politician, was born in Anderson co., Ky., March 7 1850. He first entered Kentucky University but finished his course at Bethany College in 1873. The following year he entered Marshall College, West Virginia, and one year later was admitted to the bar. After 1880 his law office was in Bowling Green, Missouri. He was city attorney for Louisville (Mo.) and Bowling Green from 1878 to 1881, was prosecuting attorney for Pike co. 1885-9, and then for three years was a member of the Missouri House of Representatives. He was a member of Congress from 1893 to 1895, and from 1919 to 1921, being Speaker from 1911 to 1919 and minority leader thereafter; he was defeated in the election of 1920. At the Democratic Convention for the nomination of a presidential candidate held at Baltimore in 1912, he led on 27 ballots, and had a clear majority on eight, but he was finally defeated by Woodrow Wilson of New Jersey. He died in Washington, D.C., March 2 1921.

CLARKE, ALEXANDER ROSS (1828-1914), British soldier, was born Dec. 16 1828. He entered the Royal Engineers, and in 1854 was placed in charge of the trigonometrical operations of the ordnance survey. He retained this position until 1881. He was one of the British representatives at the international geodetic congress held in Rome in 1883, and in 1887 received the Royal medal of the Royal Society. Colonel Clarke was a recognized authority on geodesy, and made valuable contributions to the subject. He died at Regent Feb. 11 1914.

CLARKE, SIR CASPAR PURDON (1846-1911), English art expert, was born in London Dec. 21 1846. Educated privately at Sydenham and Boulougne. In 1862 he entered the art schools at South Kensington and was trained as an architect. In 1865 he entered the Office of Works, and in 1867 was attached to the works department of the South Kensington museum. He travelled extensively for the museum, purchasing objects of art, and at the same time carried on his profession as an architect. In 1883 he became keeper of the India museum at South Kensington, in 1892 keeper of the art collections at South Kensington, in 1893 assistant-director, and in 1896 director. This post he held until 1905, when he became director of the Metropolitan museum, New York, resigning in 1910. He was knighted in 1902. He died in London March 20 1911.

CLARKE, SIR EDWARD GEORGE (1841- ), English lawyer and politician (see 6.444), retired from the bar in 1914. He published in 1878 an autobiography, The Story of my Life. Raymond Poincaré was a member of the R.W.S. He is represented in the Tate gallery by "The Girl at the Gate" (1890) and "The Gleaners Returning" (1908).

CLEMENCEAU, GEORGES EUGÈNE BENJAMIN (1841- ), French statesman (see 6.482). When Clemenceau resigned the French premiership in July 1909, he had already played as great a part in his country's history as would have satisfied the energies and ambitions of most men. He might be driven from office; nothing could force him to give up the fearless use of his critical gifts as a speaker and as a writer. Out of office he remained a formidable figure. As a senator he did his utmost to defeat Raymond Poincaré in the presidential elections of 1907. He once rallied against him all the forces of French radicalism. Clemenceau's candidate, Jules Pans, was adopted by the party caucus, but, in spite of Clemenceau, Poincaré maintained his candidacy at Versailles and was elected. There were many then who felt that at last "the Tiger" had been killed. On the boulevards, young students who, years afterwards, were to seek from Clemenceau all their hope and inspiration, paraded shouting "Down with Clemenceau!" The old fighter refused to accept this defeat. He founded l'Homme Libre, in which to carry on his warfare against Poincaré. Every morning he poured a column of acid upon the new President of the republic, but soon found himself involved in a periodic battle to support with all his strength the chief measure introduced to Parliament during the first year of Poincaré's term of office—the Three Years' Military Service bill. He belonged to the generation of defeat, and, while in no way a revanchard, believed, in spite of his cynicism, that injustice cannot be permanent, and therefore desired to see his country strong. He, more than any other Frenchman, had studied and appreciated the meaning of German military preparations, and to him also belongs the honour of having been calmly consistent in warning France of what was to come and exhorting her to gird up her loins. He fought for the Three Years' Service bill with all his strength, and in his address to the Duma he opened the eyes of many Radical opponents of the measure to the danger of allowing considerations arising from the approaching elections to cloud their judgment on a matter of life or death to the country.

On the very eve of the World War in July 1914, speaking in the Senate, he insisted upon steps being taken to press forward at top speed the realization of the artillery programme. His war writings began long before war was declared, and there are some worthy of a place in history. Among them were the articles published by l'Homme Libre under the splendid titles of "Vous ou Mourir," "Pour Faire "Triompher ou Perir." After the outbreak of hostilities he soon made acquaintance with the stupidity of rigorous censorship, and in Sept. 1914 his paper

* These figures indicate the volume and page number of the previous article.
was suppressed on account of a violent attack upon the appalling inefficiency of army medical services. With character-istic irony and decision two days later he issued l'Homme Enchaîné, a title which was kept until he himself took office on Nov. 16 1917. Each day the censorship had to forge fresh letters for chaining him. With all the skill of a surgeon Clemenceau laid bare the faults which too frequently charac-terized French war-leading. Poineur was the butt for many of his bitter jibes, and by the savagery of his opinion Clem-enceau perhaps shut himself out of office for so long a time. He fought government after government in his paper, but there the censorship put buttons on his foils. His voice, however, could not be stilled in the private proceedings of the Senate. At the beginning of the war he was president of the foreign affairs com-mittee, and when de Freycinet joined the Briand Ministry he also was elected president of the army committee of the Upper Chamber. These two posts gave him an observation post command-ing the whole field of war affairs, and his criticisms and suggestions on these committees were invaluable. M. Caillaux, in his defence, Mes Prisons, states that throughout the war two policies fought in France for supremacy—his own tendency towards reconciliation with Germany, and peace without victory, to be made very largely at the expense of Great Britain; and the uncompromising faith of Clemenceau that France must fight to a finish, that it would be better for the world and for France that she should go down into dust rather than she should live in dishonourable partnership with injustice. Caillaux's analysis is right in its main perspective, and he is also correct in stating that it was in the spring of 1917 that Clemenceau won his victory. Then it was, without a doubt, that the clear revelation of the results of the doctrine of defeatism startled the people from the war-wearyness into which they were slipping.

It was upon the wave of feeling then created that Clemenceau came into power. He had to fight not only Caillaux and his henchmen, who knew that with Clemenceau at the head of affairs their shift would be short; he also had arrayed against him a legion of self-made enemies and the instinctive distrust of mediocre politicians for a man they knew to be their master. By July 1917, Clemenceau had driven Malvy from office by his charges of negligence in dealing with enemy propaganda. The position of the whole Riot Ministry was made untenable, and the Painlevé Government was the last barrier erected against Clemenceau. Seeking to remove Malvy on Nov. 16 1917, he formed his Victory Cabinet. Nearly all the men in it and were under the Clemenceau mandate well have said: "Le Gouvernement, c'est moi."
The story of his ministry is told under France (History). A few facts and dates complete the record. He presided over the Paris Peace Conference, at which he was chief French delegate. On Feb. 19 1919 he was wounded by revolver shots fired at him as he was leaving his house in the rue Franklin, by a young an-archist, Emile Cottin (sentence of death, March 14, commuted to imprisonment for life). He allowed himself to be put forward as candidate for the presidency at the preliminary party caucus meeting on Jan. 16 1920, but, in view of the support given to M. Deschanel, he did not stand for election at the National As-sembly of Versailles, and then retired from all public activity. He afterwards traveled in Egypt and India. In June 1921 he was given a doctor's degree at Oxford University.

CLERK, SIR DUGALD (1854- ), Scottish civil engineer, was born at Glasgow March 31 1854. He was educated at the West of Scotland Technical College and the Andersonian College. He invented the Clerk cycle gas engine in 1877, improving it in 1878 (see 11,498), and became a recognized authority on internal combustion engines. He also interested himself in motor engineering, acting as judge at the automobile trials at Richmond in 1899 and 1900, and in 1908 becoming president of the Incor-porated Institution of Automobile Engineers. During the World War he became director of engineering research to the Ad-miralty, and until 1919 was a member of the advisory committee for aeronautics to the Air Ministry, and also of the air inven-tions committee. In 1908 he was elected F.R.S. He was knighted in 1917 in recognition of his work.

Cleveland (see 6,593), the largest city in Ohio and the fifth in the United States, had in 1920 a pop. of 706,841, a gain of 236,178 or 42.1% for the decade. The area in 1921 was 56-655 sq.m. as against 41 sq.m. in 1910. To the two viaducts across the valley of the Cuyahoga river were added three others, of which the most noteworthy is the High Level bridge, connecting Superior avenue on the east with Detroit avenue on the west. Its central span is 391 ft. long and 96 ft. above water, permitting the tallest masts of lake shipping to pass. The total length, with piers, is 3000 ft.

The centre of retail trade moved steadily eastward, crowding out the large houses with spacious grounds which had made Euclid avenue famous. New residential sections were developed, especially near Wade park and on the heights east of the city. Noteworthy additions were made to Cleveland architecture in the county court house and the city hall (of the incomplete "Group "plan); in office buildings like the Engineers, the Illumi-nating, the Leader-News, and the Hanna buildings; in the "Plain Dealer" newspaper building; in the Cleveland Trust Co.'s building; in the Museum of Art; and in churches, the Church of the Covenant (Presbyterian), St. Agnes (Catholic), Euclid Avenue Temple (Jewish), and the Army and Navy memorial chapel of Adelbert College.

The schools were reorganized in 1917 as a result of a "survey." Significant features were the development of junior high schools, of which there were in 1921 sixteen, and the effective establishment of departmental supervision to coordinate, standardize, and improve the work in each study. The cost of instruction in 1919 was $4,385,-000. The schools included the graded normal schools, the Normal school of Scotland, and the Girls Normal school, which was affiliated with Western Reserve University. To the university were added schools of pharmacy and of applied social science, and a department of religious education. In 1920-1 the university had 243 instructors and 2,027 students. Of other institutions of higher education, Case school of applied science had 67 instructors and 690 students. St. Ignatius College 26 instructors and 560 students. Cleveland high school and West Technical high school had 577 students. The most important addition to the educational and artistic life of the community was the Museum of Art, located in Wade park. The building, of beautiful classical design, and admirably adapted to its uses, was completed in 1916. By reason of collections already made and additional gifts, the museum at once took high rank. Its direc-tors have sought through classes, lectures, and special exhibitions, to make it a power in popular education and to coordinate its work with that of the schools and colleges. The musical development of the city was stimulated by the creation of a symphony orchestra.

In its charities Cleveland has carried far the principle of co-operation, seeking to solve local problems through soliciting contributions. In 1910 and 1920 Community Chests were organized, and sums aggregating $4,000,000 and $4,500,000 were subscribed in "drives," to meet the needs of all communities, not only those of the city, but also those of the A. and Y.W.C.A., Knights of Columbus, etc. The Cleveland Foundation was created in 1914, becoming the model for similar institutions in other cities. Its purpose was to enable a competent commission, chosen by public vote, to manage its funds, and to use them in part to meet the needs of the community, and also, after a year, to inquire on the best methods of furthering the interests of the community, and, when the funds became large enough, to apply their income directly to schemes of betterment. Under its auspices conducted in 1916 an educational survey at a cost of $50,000, a survey for a community recreation programme in 1920, and a survey of the administration of justice in 1921.

The market is the seat of a federal reserve bank. Its two largest banks were in 1921 the Union Trust Co., formed that year by the consolidation of several older banks, and the Cleveland Trust Co. In the same year the city still retained its position as the greatest automobile market in the world and also the greatest steel market.

The increase in automobile production in the decade closing in 1914 was 48.6%. The total value of all products in 1914 was $532,-531,000 compared with $172,185,101 in 1905. Harbour facilities were augmented by the innovations introduced by the Clovership, 51 ft. long. Passenger steamship service was transferred to a new 5 ac. pier on the lake front, built at a cost of $500,000.

In accordance with authority conferred by state and rule amend-ments, the state board of water, submitted by a special commission, was accepted by the citizens on July 1 1913. Under its provisions the mayor and the 26 councilmen are the only elected office holders. Authorized by the constitution, all candidates appear on ticket without party designation. Heads of departments and divisions are appointed by the mayor; all other officials are appointed accord-ing to the merit system.

They added a filtration plant, with a total capacity of 150,000 gal. a day. Water is drawn through tunnels from a submerged crib about 5 m. from shore.
The total number of men supplied by Cleveland to the U.S. armies in the War was 55,000; the total amount subscribed in the Liberty and Victory Loans was $357,041,301.

CLIFFORD, JOHN (1826-1913), British Nonconformist divine (see 6,947), resigned his position at Westbourne Park in 1918. He was president of the National Brotherhood Council from 1916 to 1919.

**CLIMATE AND CLIMATOLOGY**

(see 6,509).—In climatological progress during 1910-1921 certain general tendencies are observable. (1) Increasing emphasis has been laid upon applied, as distinguished from theoretical, climatology. Practical climatology is essentially human and economic. The investigation of its life-relations is the most important subject with which climatology has to deal. (2) More attention is being paid to the variability, the distribution, and interesting aspects of the various weather systems, and climatic elements, with correspondingly less limitation to simple mean or average values. Mathematical treatment of climatic data along well-established lines, such as the use of frequency curves, and of coefficients of correlation, is becoming more general with the result that the whole body of climatological knowledge is more precise and of greater practical value. (3) In most of the recent publications on climatography the fact is recognized that climate being average weather, no vivid and accurate picture of any climate can be gained merely from a statistical tabulation of the ordinary climatic elements. It is necessary to have clear and interesting descriptions of their variations within the ordinary climates. The addition of such descriptions has resulted in a distinct gain in the more thorough understanding of climates, especially in their relations to man. For years, one of the most significant sections of *British Rainfall* has been Dr. H. R. Mill’s discussion of the occurrence of heavy rains in relation to the actual storm conditions which brought them. Such studies have also recently been carried out in other countries.

The outstanding general text and reference book on all aspects of climatology is the 3rd ed., in three volumes, of Dr. Julius von Hann’s *Handbuch der Klimatologie.* These volumes constitute the one indispensable handbook for all who are in any way concerned with the study of climate. The first volume (1908) deals with general climatology. The second (1910) and third (1911) volumes are devoted to climatography. In them, a summary of what is known concerning the climate of every part of the world may be found. The climatic pictures are made notably complete and accurate by means of vivid descriptions of weather types; by frequent reference to the effects of climate upon vegetation, upon crops, and upon human activities, and by well-chosen quotations from the writings of residents and of travellers who are familiar with the climates concerning which they have given accounts. Temperature, rainfall and other essential data for large numbers of stations, in many cases here worked out in detail and summarized for the first time, constitute a very valuable feature of the book. All important literature up to the date of publication of the *Handbuch* is cited. References to more recent literature will be found in the regular meteorological bibliographies.

**Classification of Climates.**—In the systematic study of the world’s climates, some scheme of classification must be employed. Many such have been suggested, but there is no single element of climate and others on various combinations of these elements. The late Dr. A. J. Herbertson, whose "major natural regions" are well known, made a later study of "thermal regions," using certain critical actual temperatures (68°, 50°, 32° F.) and constructing maps which show the numbers of months during which these temperatures prevail. The duration of these critical temperatures is of importance in the distribution and growth of vegetation, and therefore also in the life of man. A more elaborate scheme of classification has been suggested by Köppen. This is a thorough revision of the classification proposed by him in 1900.

The critical features of the controlling factors are worked out with great accuracy and detail. A brief, simple scheme of two or three main cause letters (e.g., cld for climatic) is widely used in the characterization of each climatic subdivision. As a framework for comparative studies of climates and of climatic controls the new map is of great value. The critical features of the general controls exercised over season weather conditions, and hence also over climates in all parts of the world, the publication of the *Réseau Mondial* is of great significance. The compilation of this data by 10° squares is based on observations at land stations averaging two for each square. Monthly and annual summaries of pressure, temperature and precipitation are included, with charts for the year 1911.

For the general publication of broad climatic features. A treatise is a study of the snow-line. The snow-line is the result of climatic and topographic controls. An analysis of the observations of the snow-line is therefore an important subdivision of climatology. Nearly twenty years of this monograph have taken up work on a preliminary and a critical examination of the data from all parts of the world, with copious references to the sources of information.

The map of Climates and climatic variations is still under active debate, both as to the occurrence, characteristics and frequency of any such "changes," and also as to their possible causes. Dr. Ellsworth Huntington has been the most prolific writer on this problem. His investigations, which began in central Asia, have been extended over parts of western Asia, Palestine, the Libyan Desert, the southwestern United States and portions of Central America. A recent publication of a large body of evidence—archaeological, physiographic, historical—including the rings of the giant Sequoias of California, the conclusion is drawn that from the beginnings of human history a gradual change from moister to drier climates has been taking place. This process has been at times impressively progressive, but has taken place in a more or less irregular pulmonary fashion, drier and moister epochs alternating without definite periodicity, the subordinating irregularities on the generations of vegetation. The major fluctuations are believed by Huntington to have been essentially synchronous, and of the same general character under similar geographic conditions, in central and western Asia, in the Mediterranean area, and in North America. These fluctuations are further believed to have been potent factors in bringing about certain great historical migrations and events, such as, e.g., the decline of Persia, the barbarian invasions, the decay of Rome, the rise and fall of Central- and South-American civilizations, etc.

While much evidence in favour of changes of climate in historic times has been brought forward, the opinion is quite widely held that a good deal of this is not wholly trustworthy. Much of it is so distinctly contradictory that in certain cases nothing less than a complete deadlock exists. Further, it is held by a considerable number of meteorologists that much of the evidence seems to have been interpreted without due consideration of controls other than climatic fluctuations. In cases where careful examination of the evidence has been made by experts in archaeology, botany, geology and history, there has usually been hesitation in ascribing the facts solely or even primarily to fluctuations in climate.

There have been several critical studies of the evidence concerning fluctuations in climate within historic times, such as those by J. W. Gregory, Hildebrandson and Berg. It seems, at the present time, that the general opinion is that no absolutely well-founded judgment that there is not as yet sufficient unimpeachable evidence to justify the belief in any progressive change of climate within historic times. That there are certain fluctuations in the values of the climatic elements is, however, a well-established fact. The so-called Brückner period, averaging about 35 years in length, is generally recognized. No definite or universally accepted conclusion has yet been reached regarding the existence of other longer periods. A period of about 11 years in temperature, rainfall, and certain other meteorological phenomena has been made out by several investigators. On the whole, the variations in the values of these elements have appeared to be very slight, and the interpretation of them is sometimes debatable, if not contradictory. Köppen has greatly extended his investigations of sunspot controls over temperatures, begun some years ago.
CLIMATE AND CLIMATOLOGY

30 years ago, and has found that the 11-year periodicity appears to be somewhat less marked but more regular than he at first thought it to be. The increase of temperature within the tropics at times of sunspot minima is about 1°F. higher than in years of sunspot maxima, the correlation coefficient being less than 0.5 for the tropics. The general conclusions reached by Dr. Gilbert T. Walker do not appear to indicate any marked influence of variations in sunspot activity upon atmospheric conditions. The correlation coefficient in the case of the tropics, in general, shown to be much larger than would result from chance.

A. E. Douglass has for some 20 years been studying the evidence of climatic fluctuations given by tree rings in California and elsewhere, and the conclusions have been used by Huntington and others in their investigation of climatic fluctuations. In a recent volume, which also summarizes his earlier work, Douglass indicates that a close relation exists between the thickness of tree-rings and climatic conditions. The agreement is shown by the results of meteorological observations during recent years, and finds evidence of periodicity, over large areas, in agreement with the sunspot cycle or multiples of it. There is not as yet any agreement as to the causes of such climatic fluctuations. Very small irregular variations in the intensity of solar radiation are known to exist. There is also the sunspot period, and longer periods may later be established. A distinct inclination at present exists among meteorologists to seek the cause of climatic variations in the general atmospheric circulation resulting from fluctuations in the sun's activity. There has been much discussion, but there is no unanimity of opinion as to just how such variations would affect the amount of solar radiation will affect conditions on the earth's surface. A highly complex train of effects must obviously result, in which temperature, pressure, evaporation, cloudiness, and rainfall are all involved. The variations, which result in the circulation of the atmosphere play an important part. The varying strength of the atmospheric and oceanic circulations and the resulting effects upon the development and location of the great ocean currents are among the effects of the sun's influence. The writers competent to account for any climatic variations which may have taken place in historical times. Thus, in one of the outstanding publications of the past decade, Helland-Hansen and Nansen, in their study of North Atlantic terminal climate, emphasize that variations in the supply of solar energy, acting through the atmospheric circulation, are the initial cause of temperature changes on the earth's surface.

So far as the effect of a variation of short period like that of the sunspots is concerned, it seems highly probable that the effects are so many, so complex, and so mutually interdependent, that the perusal of any number of records of changes in temperature, pressure and rainfall is taking place in different parts of the world, with variations in the data of long period and we cannot say how variations in that period which numbers which probably have a general decline since 1750.

The influence of volcanic dust veils in diminishing atmospheric transparency and thus affecting temperatures has been brought forward by several writers as a possible contributing cause in climatic variations, in historical and in geological time.

So far as it may be considered, climatologists are concerned, there has been a decided tendency towards seeking an explanation in factors which are recognized as being effectively at work in determining present-day climates, and a lessened appeal to purely astronomical causes, which in the past were most widely advocated. The time has clearly yet nor come when a general agreement is to be expected on a subject as highly complex as that of climate fluctuations. The facts which demand explanation are not yet sufficiently well determined or correlated, and the processes which are at work are still too imperfectly understood.

Local Climatology.—Two countries, the United States and Australia, stand out by reason of the progress which has been made, during the past decade, in the study of climatic conditions of the climates. Mention is here made only of general studies dealing with these areas as a whole. In the United States, the preparation of a second edition of the "Handbook of American Agriculture" in 1917 marks an important advance in the accurate charting and description of the relations of the essential features of the climatic conditions of this large area. This atlas will, for many years to come, be the standard authority in the preparation of the temperatures for the treatment of the climates. The new rainfall maps are based on the records from about 3,000 stations, all covering or reduced to the uniform period of 20 years (1895-1914). The base maps show the main features of the topography, reasonable account of which is taken in locating the isohyetal lines. In the new series of sunshine maps the basic period is used. Many details of rainfall and sunshine are further set forth by the means of climate maps and graphs. The whole subject of frost has been presented with a detail not hitherto attained in any other area of equal size in the world. The average dates of first and last killing frost are charted (20-year period, 1905-1924). The January temperatures for the 100 years 1810-1910 are also given.

Two new maps of average annual snowfall of the United States have been prepared. The first of these is based on observations made in about 280 stations during the period 1874-1910. In earlier maps, the observations came mostly from near sea-level, and hence the heavy snowfalls on the mountains were not indicated. On this new map, observations at high altitudes were used and the peaks of the ranges, and the soft areas, are so marked. The second map bears the date 1919. This was prepared from all available records in the western mountains, and from the complete record E. of the Rockies for the period 1895 to 1914, and revised somewhat in order to bring it into conformity with certain obvious topographic influences. The first-named map brings out more clearly the heavier snowfalls on the mountains; the second adheres more rigidly to the general observation that the snowfall is due to the long winters and of vapour pressures, and of the wind records for the 20-year period 1891 to 1910, have added to the more accurate knowledge of United States climates.

The United States Weather Bureau has done useful work in summarizing the essential climatological data of the country by sections. This publication includes the information usually desired regarding the elements of daily weather and throughout the country, brought together in convenient form for ready reference.

Australia is the second large area a knowledge of whose climatology has advanced very rapidly in the past decade. The Australian Commonwealth Weather Bureau has issued a number of the most valuable series of reports, dealing especially with rainfall, but also presenting many other essential facts concerning the general climatic characteristics of the country. These studies are notable because of their clear concise expression and because they are based on observations laid on the practical economic aspects of the subject. A report on the climate and weather of Australia is one of the best available discussions of the meteorological and climatic conditions of any part of the globe. The many meteorological and climatological data have been published by Dr. Griffith Taylor.7

The main thesis of these monographs is the climatic limitation and control of agriculture and of stock-raising. The results are likely to be of practical value in the future development of Australia. The extreme range of rainfall along the east coast varies from the annual amounts but also of the season at which the rain falls, and of its reliability.

While the meteorology of the Arctic has made little progress during the last ten years, the Antarctic has been visited by a large number of expeditions, most of the results of whose scientific work, as well as some of the results of work done prior to 1910, have been published in the last few years. These discussions include those relating to the British expeditions of 1901-3, 1910-3 and 1914-7; the Australian expedition of 1911-3; the Norwegian of 1910-2; the German of 1911-2. Meteorological observations are now available, for comparison, to those made in the British expeditions, from which data, the combined effect of temperature, humidity, wind, evaporation, etc. Several investigators have sought to determine, in actual numerical values, the most favourable atmospheric conditions for man. Dr. Griffith Taylor, using wet bulb temperatures and relative humidities, has worked out the criteria of a suitable climate for Anglo-Saxons in the tropics. The "type white climograph" which this study suggests representing ideal conditions shows, for instance, a mean bulb reading of 75.6° F. and relative humidity of 68-70% for winter, 37° F. and 81%. Using statistics of the efficiency of factory operatives, students and others in the eastern United States, Huntington has determined what he calls the "optimum" temperatures for man's greatest efficiency. These are outdoor temperatures of 69°-65° F. for maximum physical efficiency and 40° F. for maximum mental efficiency. There has been found to be a beneficial stimulating effect in a certain moderate degree of temperature variability, which is associated with storm controls. The different parts of the world are graded according to their approximation to such a climate, and the civilizations of the world are closely adapted to these results. The conclusion is reached that a certain special combination of climatic conditions prevails today where high civilization is found; and past climatic fluctuations which brought a similar range of climate were associated with corresponding periods of high civilizations.

Climatic factors have been studied and their effects on agriculture and vegetation are well known. The most extreme range of rainfall along the east coast varies from the annual amounts but also of the season at which the rain falls, and of its reliability.

Physiological Climatology.—It has for some time been recognized that conditions which are best for human beings are moderately cool and moderately moist air, in motion, together with a reasonable humidity and a temperature of about 72° F. Numerous suggestions have been made regarding the instrumental measurement of the climatic elements most essential in this problem. In general, the tendency has been to measure the temperature in air only and to rely upon some relative humidity, or to employ ordinary wet and dry bulb thermometer readings. Dr. Leonard Hill has devised a so-called "Kata-thermometer" which indicates, by the rate of cooling of wet and dry bulb thermometers, the degree of cooling of the surface of the human body, the combined effect of temperature, humidity, wind, evaporation, etc. Several investigators have sought to determine, in actual numerical values, the most favourable atmospheric conditions for man. Dr. Griffith Taylor, using wet bulb temperatures and relative humidities, has worked out the criteria of a suitable climate for Anglo-Saxons in the tropics. The "type white climograph" which this study suggests representing ideal conditions shows, for instance, a mean bulb reading of 75.6° F. and relative humidity of 68-70% for winter, 37° F. and 81%. Using statistics of the efficiency of factory operatives, students and others in the eastern United States, Huntington has determined what he calls the "optimum" temperatures for man's greatest efficiency. These are outdoor temperatures of 69°-65° F. for maximum physical efficiency and 40° F. for maximum mental efficiency. There has been found to be a beneficial stimulating effect in a certain moderate degree of temperature variability, which is associated with storm controls. The different parts of the world are graded according to their approximation to such a climate, and the civilizations of the world are closely adapted to these results. The conclusion is reached that a certain special combination of climatic conditions prevails today where high civilization is found; and past climatic fluctuations which brought a similar range of climate were associated with corresponding periods of high civilizations.

Climatic factors have been studied and their effects on agriculture and vegetation are well known. The most extreme range of rainfall along the east coast varies from the annual amounts but also of the season at which the rain falls, and of its reliability.

In the United States, an investigation of the forests of the S.W. showed that their influence is essentially similar to that previously indicated by European observation. In other words, forests have a little higher mean annual temperature than the open; somewhat modify the extremes of temperature; reduce wind velocity and decrease evaporation. There may be only a slight effect upon precipitation except in connexion with the distribution and disposal of snow and rain.

COAL

under Lord Rhondda soon after the latter accepted the position of controller of food. In the arduous and successful work of that office he took his full share. He became president of a consumers’ food council in Dec. 1917, so that the office might keep in regular touch with the needs of the public. When Lord Rhondda died, in June 1918, he succeeded him to the general satisfaction. He gave special encouragement to the creation of national kitchens, the number of which had grown by the end of Aug. to over 600, and he set up in Sept. inside the Ministry a food council to consider questions of policy, and to cooperate with other bodies dealing with the food problems of the Allies. In consequence of the decision of the Labour party to terminate its support of the Coalition Government he resigned office in Nov. just before the general election. At the beginning of the session of 1919 he was elected vice-chairman of the party, and he took a considerable share in debate, speaking with a moderation and appreciation of the standpoint of other classes not always manifested by Labour members. At the trades union congress in Sept. he made a strong speech against the policy of “direct action,” pointing out that Labour could capture the political machine if working men were sufficiently united and sufficiently active, but that threats would only throw back their cause and set all other classes against them. But a year later he acquiesced in the establishment of a Labour council of action, and in the threat of a general strike in case of any military or naval intervention against the Soviet Government of Russia. In 1921 he was chosen chairman of the parliamentary Labour party.

COAL (see 6,573).—In 1910 the world output of coal, including lignite and anthracite, may be estimated to have been 1,160 million metric tons, and it reached 1,342 million tons in 1913. The rapid growth in the production of coal up to 1915 is indicated by the fact that in the period 1894-8 the average quantity raised each year was only 604 million tons, or about one-half the quantity raised in the year 1910. In the five years 1874-8, 285 million tons were raised each year on the average, or about one-fourth of the quantity raised in 1910.

The output of coal in 1913 was subsequently exceeded but once up to 1921, viz. in 1917, when 1,345 million tons were raised, and the dislocation in the production of coal caused by the World War is seen from the following estimates of output during the years 1910-28, prepared by the United States Geological Survey Department:

<table>

The effect of the war, however, was chiefly felt in Europe, as the following comparison of the output of coal in the years 1913 and 1920 shows:

The aggregate loss of output in Europe during the years 1914-20 was nearly equal to the quantity raised in the year 1913, or considerably more when allowance is made for the normal rate of expansion prior to the war. From the position of a continent self-contained in regard to coal supplies and able to furnish no inconsiderable part of the requirements of the navies and merchant fleets of the world, Europe had temporarily become dependent upon outside sources of supply. In 1920 coal was obtained chiefly from North America, but small quantities from South Africa, from China, from Australia and from Spitzbergen found their way to Europe.

While the output of coal in Europe in the year 1920 diminished by nearly one-fifth when compared with that of 1913, partly owing to reductions in the hours of labour and partly to labour disputes, the numbers of workpeople employed at coal-mines increased in the principal countries of Europe by about one-seventh. And after the conclusion of the war the question of the “nationalization” of the coal-mines (see NATIONALIZATION) became a subject of more or less acute controversy in the chief producing countries of the world.

The immense coal resources of the world were but imperfectly realized up to 1910, and knowledge with regard to them was greatly increased as a result of the Twelfth International Geological Congress held in 1913 at Ottawa, for which a monograph on “The Coal Resources of the World” was prepared. From this the following summary is taken:

The coal raised during the 11 years 1910-20 amounted to 13,771 million tons, or one-fifth of 1% of the estimated reserves. It should, however, be added that no deduction has been made in framing these estimates for coal which was not mineable, nor for the loss of coal in working. A large part of the coal included will be raised with great difficulty and the loss in mining will also be great.

UNITED KINGDOM

For at least half a century prior to the outbreak of war the production of coal in Great Britain increased at a substantial, if unequal, rate annually. But after the year 1913 this movement was arrested and during the three years 1918-20 the output of coal was only equal to the quantity raised in the years 1902-4. Estimated on the experience of the period 1871-1900 the output of coal in 1918-20 should have been not less than 300,000,000 statute tons per annum.

After the conclusion of the war the number of persons employed at coal-mines was greater than at any previous date, and in 1920 was 55% greater than in the year 1913. The hours of labour of those employed below ground, it is true, had been twice reduced since that year. An 8-hour shift from bank to bank (equal to more than 8½ hours per man on the average) was introduced in 1909-10, and a further reduction to 7 hours per shift was effected in July 1910. No general change was made in the hours of labour of surface workers until Jan. 1919, when a maximum 49-hour week was established. In July of the same year this was reduced to 46 hours per week, or a total reduction of 4½ hours per week over the whole period.

Prior to the introduction of the 8-hour shift below ground the annual rate of output was 285 tons per person employed, and the normal rate of output subsequently appears to have been some 20 to 25 tons less. In the years 1919 the output of each person was 195 tons, or about 200 tons, making allowance for the effect of the national strike of coal-miners in that year.

With the shrinkage in the supply of coal there had been a serious increase in its selling price. Between the years 1910 and 1914 the average selling price at the pit rose from 8s. 2d. to 10s. per ton. During the war the selling price was gradually raised, and it stood at 20s. 1½d. per ton on the average in 1918. This was due partly to the increased cost of timber and stores, but
The average selling price of coal during the latter half of 1920 was 35s. to 40s. per ton, the average for the year being 34s. 7d. per ton.

One bright feature alone emerges prominently in this picture of increasing cost and diminishing supplies of coal, in the increasing safety of the workers employed at the mines. Though the years 1910 and 1913 were both marred by mining disasters of some magnitude—that at the Senghenydd pit in Glamorganshire in the latter year being the greatest on record—there was a noticeable diminution after 1910 in the number of persons killed and injured by accidents at coal-mines.

Particulars of the quantity and value of the coal raised, the number of persons employed at coal-mines, and the numbers killed and injured by accidents during the years 1910-20, may be seen in the statement which follows:

| Quant’s  | Value at Pit (Million tons) | Average Value per ton (d.s.) | Number of Persons Employed at Coal-mines | Number of Persons Killed or Injured by Accidents

</table>

The period covered by the statement above includes the years down to 1914 during which the development of the coal resources of the country reached its zenith under the individual ownership of the mines. Early in 1912 a national strike of miners laid the pits idle for a period of six weeks and was settled by the passage of the Coal Mines (Minimum Wage) Act, 1912.

Effects of the War.—In Aug. 1914 war was declared, and early in 1915 the necessity for Government supervision of the production and distribution of coal became apparent. At first this was restricted to the limitation of the selling price of coal at home and of the quantity sold abroad. By the middle of 1916 the number of miners employed had fallen by nearly 14%, since July 1914, the younger, stronger and the most capable amongst whom had joined the fighting forces. The loss was much greater in reality, since 282,200 men had left the mines up to the end of March and the places of some 116,000 of these men had been taken by others. By the end of the war 400,000 coal-miners had joined H.M. forces. Increasing difficulties in the supply and distribution of coal were experienced, and in order to deal with them a committee representing various Government departments, railway companies, colliery owners and coal factors and merchants was appointed in Jan. 1916. This committee co-ordinated the action of other committees of colliery owners in each coal-field. At the end of 1916 acute labour troubles in the South Wales coal-field compelled the Government to take possession of the mines in the district, and on March 1 1917 similar action was taken with regard to all coal-mines.

Output and Management.—Up to 1916 the rate of output in normal years was still at or above 260 tons per person employed, the total output in 1916 being 31,000,000 tons less, and the number of persons employed 126,000 less than in 1913, the year of maximum production. The average selling price of coal in 1916, whether for consumption at home or abroad, was 15s. 7d. per ton, or 53% higher than in 1913, the highest pre-war figure since records were first established in 1882. From March 1917 to the end of March 1921 the mines were under Government control and a special Department of State was created for their administration. By powers conferred upon the Board of Trade by the Mining Injuries Act, 1917, this Department has since been organized on a permanent basis with a view to the better administration of the mining industry generally, and was assisted by the powers of control by the Government of the coal organization created early in 1916. In June 1917 the price of coal sold for export and for bunkering vessels was definitely brought under control and so remained until May 1919. The control of prices on the home market was only lifted on March 1, 1921.

As compared with the year 1916 the output of coal had fallen in 1920 by 27,000,000 tons, while the price had risen by 19s. per ton and some 215,000 additional workers had been enrolled.

The coal in coal in relation to the number of persons employed at coal-mines is a convenient measure of changes which occur in the productivity of the industry, but unless allowance is made for the increased employment the results are liable to be misleading. Fortunately for the comparison which follows, employment at coal-mines was exceptionally good from 1913 onwards except during the latter part of the years 1914 and 1920. In 1910 and 1911 employment was moderate, and in 1912 the pits were idle for about six weeks owing to the minimum-wage dispute.

Absenteeism from work on the part of the miner amounted during the war period to about 10% of the total number of possible shifts. Of this one-half was due to sickness, injury and other unavoidable causes. The normal working time of the miner in the several districts approximates closely to 51 days per week, including overtime. In the case of coal-getters about 5 days per week is usual.

When compared with the output of the American miner, these figures, even in years of maximum output, appear to be somewhat less. It is necessary, however, to bear in mind the relative thickness and accessibility of the coal measures from the surface in each country, the position in which they are found, and the extent to which mechanical cutting is capable of adoption and the method of haulage employed below ground. In some or all of these ways the American coal-miner enjoyed considerable advantages over the British miner.

The output rate of the American was affected by the calls for new development work in the pits is diminished and by the opening of new and productive pits. Since the middle of the year 1914 it is probably true to say that such work has suffered considerably, though by concentration on the best-judging areas a higher rate of output was achieved during the earlier years of the war.

The progressive nature of the fall in the rate of output, synchronizing as it did with successive increments of wages, seems to indicate that the causes were relatively similar and that this responsibility the management must share with the miners.

In the year 1917 the method of percentage additions to hewers' wages with corresponding additions to the wages of time-workers was abandoned in favour of flat-rate additions to the wages of workers of all classes, and, with minor exceptions, of all ages, as in the case of the war wage and Sankey wage. These flat-rate increments favored the lowest-paid workers at the expense of the highest-paid workers, since the relationship of the wages of each class was altered. Successive additions of uniform amount had the effect of raising the minimum rates of wages to a level at which many hewers found the productivity, and upon it, the returns they could resist. In 1920 an attempt was made to restore the percentage principle in wage adjustments and greater differentiation in respect of age, but with little success.

The coal industry, however, is influenced by good and bad weather, and it is necessary to consider how the management of the mines was affected by the arrangements made during the period of control. The position with regard to profits in the coal-mines in South Wales prior to the war has already been shown and in all other coal-fields to March 1, 1917, when the mines came under control, was the same as in all other industries. The Coal Mines Control Act, 1918, provided for the retention by colliery owners of the profits earned when they did not exceed the amount of the pre-war standard fixed for excess-profits duty. Where this amount was exceeded, one-fourth was retained and the balance was collected as coal-mines excess payments. From the sums so collected the pre-war profit of the collieries earning less than the pre-war standard of profit was made good, but the full pre-war standard...
of profit was permitted only in cases where output was fully maintained and the business was efficiently conducted.

This arrangement was amended retrospectively as from April 1, 1919 by the Coal Mines (Emergency) Act, 1920, by which the industry was regarded as a single concern. Where the pre-war standard of profit was exceeded, nine-tenths of the excess profit was paid over to the State, while of the remaining one-tenth, after the deduction of excess-profits duty, one-half was distributed on a tonnage basis to all collieries and one-half was shared by the collieries contributing the excess profits. The net amount of excess profit retained by the industry was 4% of the general profits earned.

Owing to the serious fall in the price of coal sold abroad early in 1921 a further variation was made in the existing arrangement by which profits in excess of nine-tenths of the pre-war standard were required to be surrendered and which came into operation on March 1, 1921.

The general effect of these intricate arrangements was to curtail the excessive profits collected. The industry was much more severely hit than in other industries, and it is difficult to resist the conclusion that the decline in the rate of output after 1916 was largely due to the stifling of incentive in both the management and the workers.

The distribution of the revenue of the industry in 1918, 1919 and 1920 is shown by the following comparisons, the amounts being calculated on the basis of the tonnage of coal disposed of:

Coal Raised per Person Employed per Quarter | 661/2 tons (average) | 581/2 tons (average) | 50 tons (average) | £21 (average) | £12 | £59

Though not strictly comparable owing to minor differences in the method of computation, these figures show the progressive increase in the cost of production and the disparity in the rates of output and earnings of the workers. In 1913 rather more than one ton of coal was raised on the average for each man shift worked, the average earnings per shift being about 6s. 6d. In the third quarter of 1920 the average earnings were nearly 17s. per shift, while not more than 16 cwt. of coal were raised.

Against the balance of proceeds has to be set the cost of depreciation, which was heavy and the profits in each year, and in 1918 and 1920 excess-profits duty and the cost of control. Various estimates have been made of the amount of capital invested in the coal-mining industry. Owing to the consumption of coke, iron and steel-making, with the production of coal, the results were necessarily approximate, but for the years prior to the outbreak of the war may be taken at £100,000,000, not including the capital invested in coke ovens and by-product plants. The capital of the industry in 1921 was more than £50,000,000 greater.

During the years 1909 to 1914 the average profits earned, apart from royalties, were nearly 10% per annum of the capital invested, making no deduction for profits carried to reserve and capitalized. In the three years following profits, exclusive of royalties and excess-profits duty, amounted to 17% per annum, and during the years 1917 to 1921, to 15½% per annum. Making allowance for profits reinvested in the industry during the seven years 1914-21, the amount available for dividends, partners’ drawings, and income tax represented a possible yield of 11½% per annum on the capital employed in the industry.

During the quarter ended Sept. 1920 the average price of coal sold at home was just over 33¢ per ton at the pit, that of coal shipped as foreign bunkers 67¢. 3d. per ton and not of coal exported £1. 3s. 5d. per ton. The surplus revenue of the bunkers and export coal provided the fund from which the profits of the industry were paid. During the winter of 1919-20 a special rebate of 10s. per ton was granted on coal sold for domestic use, including coal converted to gas for electric-lighting purposes and domestic heat and light. The average selling price at this period did not greatly exceed 10s. per ton at the pit.

The home consumer, it will be seen, enjoyed considerable advantages in regard to the price of coal, but the protection of the home consumer extended to the quantities supplied, which were maintained throughout the war and subsequently at the same level, approximately, as before the war.

The quantities of coal shiped abroad during the years 1919-20 and the quantities available in each year for consumption at home are shown below:

As compared with the year 1913 the reduction in output amounted in 1920 to 58 million tons which fell almost entirely on supplies for shipment abroad, the home supply suffering to a very slight extent from the difference. The bulk of the coal shipped abroad, apart from that shipped as bunkers, was supplied to Europe and the countries lying round the Mediterranean Sea as is shown below:

The reduction of 10-6 million tons in the consumption of coal between 1913 and 1919 was almost entirely accounted for by the lessened industrial demand for coal upon the cessation of war.

Plant and Equipment.—While the importance of an adequate supply of coal assured a certain measure of priority during the war to the demands made for colliery plant and equipment, it was inevitable that some falling off should be observed in the provision and perfection of plant and equipment as compared with the years immediately preceding the war. The importance of this arises from the fact that the coal used at colliery engines amounts to about one-tenth of the consumption at home.

In the year 1912 the capacity of the engines in use at coal-mines (including the stratified iron-mines of the Cleveland district) was 2,925,378 H.P., of which some 10% was used for the generation of electric power at light. The capacity of the motors then installed is known, but since the year 1912 the capacity of electrical apparatus in use at coal-mines has doubled.

There were 1,989 mechanical coal-cutters installed in mines in 1919 and nearly 16 million tons of mineral were cut by these machines. In 1920 the number of machines had increased to 5,073 with an output of 30.9 million tons of mineral. The chain-drive machine has shown the greatest relative increase in the interval, though steam machines show the greatest absolute increase.

The tenacity with which the industry clings to past tradition is nowhere seen more clearly perhaps than in the maintenance of horse-drawn and ponies for haulage work below ground. In 1919 there were 67,279 horses and ponies so employed at coal-mines, or only 3,727 less than in 1912. The number of mechanical conveyors employed at the coal face increased from 2,754 in 1910 to 825 in 1920.

† Including the coal equivalent of coke and manufactured fuel exported.
While the tallow dip used as an illuminant below ground is not yet extinct, the safety lamp is all but supreme. In 1910 there were 705,482 of these in use, including 2,055 electric portable lamps. The total number of persons employed at coal-mines was 5,533,861 and of these 197,722 were electric lamps. In 1920 the number of electric lamps in use had risen to 245,900. The caution which necessarily marks the extended use of electricity below ground for lighting and power is less apparent in the instance of death, since it is clear that the use of electric lamps, but there are limits to the universal use of electric lamps in mines where the risk of finding gas is great.

The Royal Commission on Mines, which was appointed in 1906, dealt exhaustively with the health and safety of miners and the administration of the Mines Act. The chief recommendation of the Commission related to the augmentation of the staff of miners inspectors, the system of inspections and the introduction of practical miners on the inspectors; fixing of responsibility upon owners and their agents; qualification by examination of experience of firemen and deputies; greater regularity and frequency of inspections; a higher standard of ventilation; investigation of the methods of minimizing the quantity of coal-dust in mines; precautions to be adopted in shot-thinking; rules for the proper testing and use of safety lamps; effective lighting of mines; regular medical inspection of winding engineers; organization of rescue stations and the provision of rescue apparatus; provision for pit-head baths and dressing-rooms; and the accurate keeping of colliery plans. Each of these recommendations, which were embodied in the Coal Mines Act, 1911, this Act consolidated and codified the law in regard to safety at coal-mines, and as of its proclamation is the most detailed of any form of Government regulation of industry.

The most notable additions made in the decade to the provisions for the safety of mine workers were the organization of measures for dealing with incidents below ground due to gas, fire, or explosions, which was brought into operation in 1910, and the introduction of preventive measures against explosions of coal-dust.

Fairy complete arrangements had by 1921 been made for the organization and training of rescue brigades and the provision of appliances at mines. At the end of 1919 there were 49 central rescue stations each with its trained rescue brigade, a minimum provision of breathing apparatus and other appliances, and able to supply the oxygen or liquid gas required for the use of the former. These stations provided the rescue service for 610 mines, or groups of mines, and there were in addition 553 mines or mine groups at which 125 of the rescue brigades were maintained with a suitable provision of breathing apparatus and appliances. These brigades are recruited from the mine workers and each consists of five or six men who are required to qualify by prescribed courses of training and practice in the use of its apparatus and to be maintained in the constant state of readiness.

Following the recommendation made by the Royal Commission on Mines, experimental work with regard to the origin of coal-dust explosions in mines and the measures to be taken for their prevention was carried out at Altofts in Yorkshire by the Mining Association laboratories. This work was represented in 1911 the Home Secretary appointed a committee of experts to control and direct an experimental inquiry at Eakmele, near Barrow-in-Furness, in continuation of this work.

The conclusions arrived at as a result of these experiments were that by stone-dusting or by water-dipping, or by a combination of both methods, the risk from explosions would be very greatly minimized, if not prevented, and a preliminary communication in this sense was sent to colliery owners in 1912. Owing to the war, statutory effect was not given to the recommendations of the Home Office Committee until July 1920.

The number of deaths and injuries to persons caused by accidents at all mines of coal, stratified ironstone, shale and fireclay in the years 1910, 1913 and 1920, distinguishing the place and cause of injury or death, is shown below. Injuries involving an absence from work for less than seven days are not recorded:

The accident experience at coal-mines in the years 1910 and 1920 is similar and differs widely from that of 1910 and 1913 whether the disastrous explosions of the earlier years are included or not. Having regard to the exceptional conditions of the industry in 1910 and 1920, however, it would be premature to conclude that a permanent reduction of the magnitude indicated by the figures above had taken place in the number of deaths and injuries caused by accidents.

The staff of inspectors in 1921 numbered 81, or twice as many as in 1910; but greater regularity and frequency of inspection would appear to be a less adequate explanation of the diminished number of accidents than the growing self-consciousness of the workers as a class. This growth is the outcome of the improvement in the general standard of education, and it has been stimulated by the increasing importance of the use of miners' ventilating apparatus and by the introduction of the idea of the responsibility of the miners for their own safety. It has been invested since the year 1910. Indicators of this may be seen in the partial satisfaction of the demand for the appointment of practical miners as inspectors, in the number of apprentices, workmen and colliery officials who obtain certificates of competency each year as managers and under-managers of mines, and in the provision made in the Coal Mines Act, 1911, for the certification of fitters, examiners, and deputies. Altogether 15,000 candidates had up to

1 Including persons employed at stratified ironstone, shale and fireclay mines.
1919 presented themselves for examination, the majority of whom were successful. Nor should sight be lost of the training of the rescue brigades in this connexion.

While the contribution of each and all of the factors referred to above cannot be ignored, the question arises whether some more fundamental cause may not be responsible for the greatly reduced number of fatalities. Reference has already been made to the effect of the Minimum Wage Act of 1912 upon the rate of production of coal, and it is not inconceivable that economy of physical effort may have diminished the accident risk of the workers.

Statistics with regard to the mortality of miners show that although they appear to suffer more than the average from diseases of the respiratory system, the mortality of miners from phthisis is little more than one-half of the average, as is also that from accidents, by liver diseases and from suicide. The mortality of miners from influenza, cancer, diseases of the nervous and circulatory systems and Bright's disease is also below the standard.

The mortality of the miner as a class is further attested by the information obtained in 1911 with regard to the fertility of marriage. The class showed a higher number of children born per family than in any other social class, but it was also shown that in no other class of the community is the rate of child mortality higher. The importance of the housing problem for miners will be obvious.

Position in 1921.—The year 1921 opened disastrously for the coal-mining industry owing to a wave of industrial depression as well as to the war. This was followed by a dispute of unprecedented magnitude with regard to the future regulation of wages (see Strikes). The output of coal during the first quarter of the year was at the annual rate of little more than 215,000,000 tons, while during the whole of the second quarter nearly all the pits were idle. Nor were the effects of the industrial depression confined to the home market. When early in 1921 the restrictions on the supplies of coal for bunkering vessels and for export were finally removed, British supplies abroad came sharply into competition with those from the United States and with German coal supplied to France and Belgium by way of reparation.

Yet, disastrous as were the immediate consequences to the industry, signs were not wanting that the industry might be restored in the near future to a degree of efficiency not previously surpassed. The turmoil of recent years would have been in vain if it had not settled one or two fundamental questions in no uncertain measure. It was already clear that the time had not yet arrived when the State could with advantage to the community take over the ownership of the coal-mines, notwithstanding the conclusions of the Coal Industry Commission of 1910. But it was not less clear that the principles which had hitherto governed the relations of labour and capital in the industry were wrong. The regulation of wages by reference to the selling price of coal with its evil corollary—the limitation of supply—had gone beyond recall. The proposal made by the mine-owners in 1921 to regulate wages and profits in accordance with the prosperity of the industry was based upon principles as fruitful as they were sound, and now that ways and means for the adoption of the proposal have been found, it is not too much to say that a key has been fitted to the gates of a new world.

The ability of Great Britain to maintain its position industrially is largely dependent upon the existence of a cheap and plentiful supply of coal. Under efficient management, no reasonable doubt can be entertained with regard to the ability of the industry to furnish these supplies, and certain qualities of coal produced are unrivalled. Moreover, their proximity to the sea ensures advantages which few other coal-producing countries possess, and it needs but a brief examination to show what abundant reserves of coal are still available.

Reserves.—In 1904 the Royal Commission on coal supplies estimated the reserves of coal within 4,000 ft. of the surface at 141,696 million tons. Sir Saraband Strahan, the Director-General of the Geological Survey of England and Wales, reexamined the evidence and he concluded that 178,727 million tons of coal remained unworked in the year 1910. The quantity available, as thus estimated, would be in close agreement with the earlier estimate when allowance is made for the coal raised during the interval and the quantities which must be left for the support of surface buildings, barriers, etc. The latest estimate was that made in the year 1915 by Prof. H. Stanley Jeffers, and it is stated that reserves of coal were placed at 197,000 million tons within 4,000 ft. of the surface. When the necessary deductions have been made for loss in mining and for the coal raised since 1910, the quantity available for use would be some 13,000 million tons greater than the previous estimate.

Having regard to the proved extensions of the concealed coalfields of Yorkshire, Nottinghamshire and Kent since the earlier estimates were framed, it may be assumed with some confidence that the reserves of coal available in 1921 amount to not less than 135,000 million tons, and might amount to 150,000 million tons, with little addition to further considerable quantities at depths lower than 4,000 ft. or in concealed areas.

Some idea of the magnitude of the reserves of coal thus indicated was given by the Federal Commission of the United States since 1855 shown below. The quantities of coal shipped abroad and available for home consumption are added for comparison—

(R. F. T.)

United States

Previous to the 10-year period ushered in with 1911, bituminous coal production in the United States was scattered, uncoordinated and wasteful. The mines had a variable but large idle capacity, and the uncertainty of operations was such as to preclude the possibility of the maintenance of an adequate output: the technique and practice of storing coal were imperfectly developed, as was still the case to a great measure in 1920; the seasonal fluctuations of demand were uncompensated. Those conditions were essentially the product of past circumstances—excessive competition, over-development of resources, and inadequate prices at the mine mouth, which led to poor engineering and low recoveries of values. The technology of production during the World War period—1914-18—showed great improvement, and there was evidence of growing industrial efficiency in extorting coal, although this progress was accompanied by excessive prices and an approach to monopolistic conditions. Bituminous and anthracite formed over a third of all U.S. freight in 1920, but transportation was the weakest link in the supply. Continuous mining depends on an unbroken movement of coal-cars past the mine mouths; and the number of coal-cars has never been equal to the full capacity of the developed mines. Unless railroad equipment becomes more nearly adequate, every period of industrial prosperity must result in a car shortage.

The United States had in 1920 the largest coal reserve of any country—about 3,527,000 million tons out of a total world reserve of 7,000,000 million tons, and a good reserve of each of the several classes of coal. For many generations there will be no danger of a shortage except of anthracite, good coking coal, and the highest grades of steam coal, which in 1920 were being actively mined. Each year found anthracite more of a luxury. Three thousand million tons of hard coal had been consumed, and the thinner, deeper and poorer seams were being mined. If the rate of consumption in 1920 continued, the United States would use up more anthracite between 1930 and 1940 than it did in the preceding 100 years. It is bituminous coal, therefore, that will support the future industrial life of the United States. According to geologists the country had in 1920 upward of 1,400,000 million tons of the various grades of true bituminous coals in addition to 49,863 million tons of semi-british bituminous, 987,514 million tons of sub-bituminous and 1,003,200 million tons of lignite. Of these total deposits, however, less than 5% were high-grade coals. Almost all the production before 1920 came from this better class of coal.
fuel. The earliest depletion of steam and gas coals will come in the fields that have supplied the great manufacturing districts of the eastern states.

Throughout the greater part of the country the large operating coal companies owned both surface and mineral rights. In certain districts coal land that sold in 1910 for $50 an acre brought $750 in 1920, and the purchase of 60-acre tracts at $10 an acre was generally leased at royalties of about 10 cents per ton. In the Rocky Mountain region the Government sold the coal rights, but the state school lands of Colorado and Wyoming were generally leased at royalties of about 10 cents a ton. In the state of Washington a considerable area of the bituminous district was owned by the Northern Pacific railway, which had opened up the territory and had spent large sums on surveying and road building. The royalty was 15 to 25 cents a ton. In Alaska, in the Matanuska and Bering river bituminous fields, and in the Nenana Ignite field, the Government offered the coal for leasing at 2 cents a ton for the first period, under restrictions providing for conservation and reasonable prices to consumers. Some units were taken up in the Matanuska and Bering river fields, but as the measures are badly contorted and the coal-beds difficult to trace progress was slow, and in 1920 the production was scarcely begun. In 1920 the Alaskan Railway Commission was working some mines temporarily at Chickaloon and Esk Creek to obtain a supply of coal pending the development of other mines. In 1913, 1,532,000,000 tons in 1920, and the average annual mining capacity was 123,000,000 tons, the mine capacity approximately 715,000,000 tons, and the mine workers numbered 615,000.

Analysis of the records for the 30-year period 1890-1920 shows that coal output and labour employed during this period increased largely, and that the production of the average mine-worker was increased more than threefold, and the output per man was increased fourfold. Since 1890 the coal mines lost 30% of the annual production in the year 1894, but the remainder of the period is comparatively free from depression—1894, 1904, 1910, 1911 and 1914. Mine capacity kept well in advance of output, largely because of ever-increasing expenditures in mine equipment, which also largely accounted for the increased average production per man underground from 579 tons in 1890 to 1,134 tons in 1918.

The considerable time lost in the soft-coal industry is shown by the fact that in only seven of the years during the period from 1890-1919 the year was lost time less than 25% of the working year. That coal-mines are idle for many days in the year is familiar to everybody acquainted with the industry; but what is not generally realized is the amount of output lost in this way. During the period 1890-1919, two working days a year, the bituminous mines were idle on the average 93 days. Ten times during that period the time lost exceeded 100 working days. The greatest loss was in 1894, when the average for all mines was 229 days. But the greatest loss occurred in 1918, the year of record production; yet even then the mines were closed down for one cause or another for the equivalent of 102 working days out of the 358 available. The figures for lost time indicate only the days that the mines were not operated. Absenteeism of a part of the force when the mines were running still further reduced the output. The greatest extremes in output ever recorded in the coal mining industry occurred in 1913, when the rate of production rose in March to 123% of the monthly average for the year and fell in April to 66%.

The high rate was nearly twice the low. In that year two influences were at work: the normal seasonal fluctuation was intensified and the biennial coal strike in 1914, that the biennial cycle occurs, disturbance, or slump was aggravated by strikes, in anticipation of which there had been an anxious buying in March. The year 1914 may be taken as a somewhat exaggerating example of the fluctuation to be expected in the year—biennial wage adjustment. In respect, however, 1914 was not typical. The autumn peak came in Sept., and was followed in the last quarter of the year by a depression, and was one that was never surpassed in the history of the world War. In other years the peak was reached in November.

When monthly fluctuations represent seasonal fluctuations in demand only, uninfluenced by labour disturbances, as in 1913, such extremes are clearly accounted for. If, however, the strike of 1914 was accepted as a part of the general coal industry, the control practically disappeared with the war. There was a growing feeling, however, that production and distribution should be classed as a public utility and regulated.

In the 10 years from 1891 to 1900 the average annual working time of the mine workers in the anthracite regions ranged from 150 to 205 days, with a mean average of 176 days. During this period the entire anthracite industry was demoralized. A great strike occurred in the hard-coal region in 1902. President Roosevelt appointed a commission, and the anthracite industry emerged from the difficulties plus a Board of Conciliation, composed of representatives of the operators and the miners, which was still in power in 1910. Under this plan the annual working time in the hard-coal mines increased gradually to 229 days in 1910, about 30% over the annual average working time of the 10-year period preceding the appointment of the Board. From 1911 to 1920 the annual average never fell below 230, and the mean was 255 days. The better conditions for miners in the anthracite field after 1902 were not solely due to increased annual working time. Between 1902 and 1907 there was also an increase in wages of something like 85 per cent. In the period 1913-1919 the rate of anthracite production changed materially, but the next decade, 1919-20, showed a drop, due to the reduction of the working-day from nine to eight hours.

In 1920 it seemed practically impossible to duplicate in the bituminous fields the conditions existing in the anthracite region. The anthracite mines all lie in a small area of one state, Pennsylvania. The colliers were all owned by a few large companies, which rendered it possible to centralize the control in a few men. But bituminous coal in 1920 was mined in 27 states, various producing districts competing for the same markets. It was because of this wide distribution of soft coal that it had never been possible to bring about unified action. Yet production managed to keep pace with the country's normal industrial growth. The industry grew from an output of 111,000,000 tons in 1890, from mines whose aggregate capacity was estimated at 1,525,000,000 tons, to the recorded figures of 1920, 579,000,000 tons, the mine capacity approximately 715,000,000 tons, and the mine workers numbered 615,000.
regions in which interruptions were most pronounced showed a tendency to become union territory. The presence of the union is both cause and effect. Wage disputes cause lost time, but on the other hand, irregular employment is a prime incentive to unionization. Full-time operation, if it could be brought about, would reduce production costs per ton. Careful investigation of many mining operations disclosed that the cost of mining varied as much as 60 cents a ton from one month to another, depending on the number of idle hours. A coal-mine differs from a factory, however, when closed needs only a watchman to guard it. In an idle mine the forces of nature are busy: there are roof and floor movements that change the haulways; there are gas exudations and mists of water with which to contend. An idle mine cannot be left unattended, without heavy loss. In mining the costs go on even if the coal is not produced.

At the end of 1920 experts agreed that there was no prospect of a return to pre-war prices because of the larger difficulties of mining less favourable seams, more costly equipment, higher wages and increased freight rates. These changes seemed likely to cost the people of the United States upward of a thousand million dollars annually as compared with the fuel bills of 1914. During the period 1920-20, the population of the United States increased 42%, and the consumption of coal 17%. Mechanical means, more and more employed to do work formerly done by hand, consumed more power, and coal was the chief source of energy. Assuming that the population and industrial growth of the United States continue unchecked, and that the use of coal increases accordingly, by the year 1940 the United States will be consuming 1,400,000,000 tons of coal annually. It would be wholly impossible for the system of American railways as constituted in 1920 to handle any such production and at the same time carry the normal increase of other freight. It appeared essential, therefore, that immediate thought be given to the important problem of a national power supply.

There were in 1920 about 8,000 commercial or shipping mines producing bituminous or anthracite coal in the United States, and about 12,000 "wagon mines," or "country lands," supplying local trade. Kentucky, West Virginia and Ohio had the greatest number of these small openings. Though the total production of these country lands was less than 1% of the total output, the effect of dumping their unprepared and inferior product on the general market was not desirable, and as a miner can produce from two to four times as much coal in a properly developed colliery as in the average wagon mines, the effect on the labour situation was adverse.

The whole American coal industry in 1920 employed 750,000 men in and about the mines. The operations in the Appalachian fields, from the Tennessee-Kentucky line N. into Pennsylvania, furnished the bulk of the bituminous coal used in New York and New England. The Appalachian region also provided all the bituminous coal exported to Canada. Consumers required shipments of at least 28,000,000 tons monthly from the mines. In winter all this output was consumed as fast as produced, but in summer consumption dropped to approximately 24,000,000 tons a month. The remainder, about 4,000,000 tons a month, normally served to build up winter stocks in New England, the north-western states and Canada. An analysis of coal production in the United States by periods and decades shows that, and by years from 1908, is given in the annexed table in short tons.

The table illustrates the great increase of American industries, which absorb nearly all of the bituminous production. Gauging the industrial development of the different portions by the per capita consumption of coal, it is interesting to note that in the United States the annual consumption per capita in 1920 was six tons; in the United Kingdom it was estimated at 9.1 tons; in Germany 3.4; France 1.1; Italy 0.34; and Russia 0.18. Before the outbreak of the World War in 1914, Belgium was consuming about four tons of coal per capita, which indicated its intense industrial development. While the outbreak of European nations greatly reduced in recent years, the production of the United States increased. American mines in 1918, as shown by the table below, under stress of war demands broke all records, producing nearly 600,000,000 tons of bituminous coal. The average production per man during that year was 1,152 short tons. The closest competitor was New South Wales, where each underground worker in 1918 produced 814 tons. British Columbia ranked third with 790 tons, and Nova Scotia fourth with 718.

Mining machines play an important part in the development of coal-mining in the United States in the period 1910-20. In 1918, 18,063 machines were in use in the bituminous mines, an increase of 1,282 over 1917, and 2,555 over 1916. The tonnage mined by machine in 1918 was 323,936,000, an increase of 17,555,000 tons, or 5.7% as compared with 1917. No great change occurred in the proportionate machine output for 1920, because the intense demand called for a large production by hand as well. In 1916 the proportion of the total output mined by machines was 36.5%; in 1917 it was 55.5% and in 1918 59.9%.

Of the annual bituminous production in the United States in 1920, 40% was used for steam or industrial purposes, 27% was burned on the railways, 15% was used for household purposes and the remaining 18% consumed in coking, exports, smelting, gas-works and bunkering. Assuming that it is possible to obtain the by-products from 25% of the bituminous coal and from 50% of the railway coal through establishing control stations and electrically, also that all the household coal can be coked first (which could be done if required, and only the coke produced), it has been calculated that 195,000,000 tons of bituminous that in 1920 was burned raw in the United States should have been coked. If but two-thirds of this tonnage could have been subjected successfully to by-product coking, the saving would have amounted to at least $238,000,000. In other words, more than $200,000,000 went up in smoke from American plants in a year. Production of coke in 1920 was nearly 7,000,000 tons. Of this quantity approximately 30,000,000 tons were produced in the old-fashioned beehive ovens and the re-

---

*Estimated.—Bituminous coal in the United States is mined and sold in short or "net" tons. Anthracite is mined and sold in long tons. The figures in the table for anthracite have been reduced to net tons to make them correspond to the bituminous figures.

NOTE.—Anthracite production exceeded bituminous until after the Civil War. After that time it became proportionately less, from year to year. In 1908 bituminous production had become about four times as great as anthracite, and in 1918 it had become nearly six times as great.
mainly, 27,000,000 tons came from by-product ovens. The maxi-
mum capacity of the by-product plants of the United States has
been estimated at 45,000,000 tons at the beginning of 1919, and
39,500,000 at the beginning of 1920. These estimates were based
on 100% operation. In actual practice, however, an average operation above 90% cannot
be expected, and for the country as a whole 85% is a safer figure.
This would show the capacity for 1920 to be 33,575,000 tons.
Estimated according to the quantity of by-product coke produced in
1919, 25,171,000 tons, by-products recovered during that year
were 7,400,000 tons of anhydrite of sulfur, equivalent to 23,900,
000 gal. of tar, 84,800,000 gal. of crude light oil, and 367,700,000
cub. ft. of gas. The largest by-product coke plant in the world in
1920 was that of Clairton, Pa., owned by the Carnegie Steel Co.
This plant captures 7,000 tons of high volatile coals daily, pro-
ducing 8,000 tons of metallurgical coke, 150 gal. of coal tar, 75,000,
000 cub. ft. of gas, 40,000 gal. of light oil and 174 tons of am-
monium sulphate each 24 hours. The comparative production of
these results varies in different parts of the country.
In contrast with the reserves of coal in the United States and the
annual production, the exports in 1913 (a normal year) were only
about 12% of the exports of coal from all other countries; and
a large part of the American exports went to Canada by rail. Of
sea-borne coal, the United States sent out only about 4%. This small
proportion of ocean trade was due to the distance of American
coal from seaports, the lack of organization among operators and
and among related shipping organizations, and further, to the relative
independence of the United States, which could utilize only a small
amount of the world's export coal on the return coal-handling ships. Most of the American coal was used at home, but
the advantage of exporting a considerable quantity of coal, for its
effect in increasing trade relationships with other countries, was
hostile to the independent trend. As a result of the war, the
United States exported coal at the rate of 65,000,000 tons a year.
This was practically every pound of coal that could be shipped to
ports in the Atlantic. The total coal-loading capacity of the
Atlantic coal export docks was about 31,000 tons per 10-hour day. It was this limited coal-handling facility which maltreated to a large extent against the United States gaining a per-
manent position as the world's leading coal export nation.

The war opened several foreign markets, especially in South
America, to U.S. coal. The United States had coal stations as far away as the Samoa Is. and Manila, but little coal reached
them from America. American coal supplied the Government
coaling stations in Alaska, Hawaii, the home ports both Atlantic
and Pacific, Cuba, Puerto Rico, Nicaguaran ports, Panama
Canal ports, Mazarran (Mexico) and South American ports.

U.S. Government Control, 1917-20.—On April 6 1917 the
United States entered the World War, and centralized war-
time control over the coal industry was delegated by President
Wilson, in May 1917, to an officially constituted Fuel Board,
with Francis S. Peabody, a practical coal operator, as chairman.
Soon after the formation of the Board, plans were announced for
the stabilizing of coal prices, the collecting of production
statistics, and the efficient distribution of coal.

The Fuel Board acted as a kind of clearing-house, collating
and digesting the vast mass of information needed. In June 1917 labour was given representation on the board, and the
way thus smoothed for more efficient cooperation between the
board and the mine workers. Keenly desirous of efficiently
handling the coal situation, the Federal Trade Commission,
through the Fuel Board, made recommendations which created
surprise, as no such drastic measures had been expected. In
essence, the most important of these recommendations were:
First, the institution of a pooling arrangement, to be placed
in the hands of a Government agency, to control the production
and distribution of coal and coke. The producers were to be paid
the same per ton of production plus a uniform profit per ton, with
due allowance for quality of product and efficiency of service.
Second, all agencies of transportation, by both rail and water,
were to be similarly pooled and operated on Government account,
as a unit, under direction of the President. The owning cor-
porations were to be paid a fair compensation, which would
cover normal net profit, upkeep and betterments.
In the latter part of June 1917, after conferences with the
coal-operatives, the Fuel Board (then known as the Committee
on Coal Production) made sweeping reductions in the current
prices of bituminous coal, which had been showing a tendency
to rise to unheard-of levels. Early in these conferences it be-
came apparent that a national organization of coal operators
would be necessary to carry into effect the price-fixing and other
plans of the Government. A tentative organization was formed,
composed of the secretaries of the 25 coal-trade associations
which were represented at the sessions. C. P. White, of Cleve-
dland, was chairman of this new body, and C. E. Loster, statisti-
cian of the U.S. Geological Survey, was secretary. The associa-
tion was to work in conjunction with Mr. Peabody's committee,
and to be supported by an assessment not to exceed one-quarter mill per ton, levied on all operating coal companies
in the United States. By Aug. 1 1917 the pooling arrangement
suggested by the Federal Trade Commission was in full operation.
All shippers of tidewater bituminous coal had agreed to pool
their output at the ports of New York, Philadelphia, Baltimore and
Hampton Roads. The regulations fixing maximum prices for
coal, announced by the Committee on Coal Production, were
carefully observed by the coal operators, although the figures
had been characterized as "unjust" in some quarters and as " exor-
bitant and oppressive" by Secretary of War Baker, who wanted cheap fuel for the navy.

The prices set by the Committee on Coal Production were
short-lived, for on Aug. 21 1917 President Wilson took price-
fixing into his own hands and prescribed provisional prices to
cover all the bituminous-coal-producing districts of the country.
The new figures were one-third lower than those agreed upon
voluntarily by the operators in concert with Mr. Peabody.
The announcement of the new prices stated that they were
based upon actual cost of production and were deemed to be
more equitable, but no change in production was made, however, for a
reconsideration "when the whole method of administering the
fuel supplies of the country shall have been satisfactorily
organized and put into operation." All the coal operators in the
United States were called upon by the Board of Directors of the
National Association of Coal Operators to meet Aug. 29 1917
at Pittsburg, to discuss the latest ruling.

Soon after the President's announcement fixing the prices of
soft coal, came the setting of prices of anthracite coal, the
specification of the margin of profit that could be charged by
a jobber and the naming of a coal controller. In a fifty-word
statement, President Wilson announced that, in accordance
with an Act of Congress approved Aug. 19 1917, he had ap-
pointed Harry A. Garfield, president of Williams College, as
his fully empowered representative on control of fuel.

The new schedule of coal prices had no appreciable effect on
anthracite, though it threw the bituminous trade into con-
fusion. Practically all coal disappeared from the market, and
delegations from all parts of the country rushed to Washington
in an endeavour to have the prices on bituminous coal increased.
Dealers who had purchased stocks of coal at prices considerably
above the latest Government figures were in a quandary. On
Sept. 8 1917 Mr. Garfield made public his plans for controlling
retail prices of coal by the formation of local fuel administrators
in every coal-consuming section of the country. Soon after,
in-itations came from Washington that the President's pro-
visional prices for bituminous coal would be increased, as the
original schedule had tended to decrease production. In
the autumn of 1917 the educational department of the Fuel Ad-
mnistration, in the daily press and in circulars, posters and
pamphlets, began to preach economy to both domestic and
industrial coal consumers. Industries that were not strictly
necessary were asked to limit the use of coal, and to consider
their future coal supplies. Through the fall of 1917 the demand
for both anthracite and bituminous coal was urgent, and many
sections of the country were in dire straits for want of soft
coal. The price of bituminous had been increased 45 cents mean-
time, the advance being made to cover the increase in the
miners' wage scale that had gone into effect.

By Dec. 1917 it became evident to those in the coal industry
that the Fuel Administration would brook no interference with
its plans. The personnel of the Administration had been growing
since its inception, and there were organizations in most of the
states of the Union. With the coming of the exceptionally cold

COAL 713
COAL

winter of 1917-8, came more urgent demands for coal from all classes of consumers. New England in particular was in distress, and large cities such as New York could get but little hard coal for heating. The great tonnage which the railways were called upon to handle congested the yards, terminals and equipment so that it became impossible to supply quickly even the most vital needs. Embargo followed embargo, and preferential shipment orders for sundry commodities further hampered transportation. Dr. Garfield stated that adequate coal supply depended in large measure upon more ample transportation. Every soft-coal operator reported a shortage of coal-carrying equipment, and although the clamour for relief was loud and long, no one seemed to know just what steps to take to ameliorate this condition. The Government was then made to deal with the problem by conservation. Estimates by the fuel authorities indicated a shortage of at least 50,000,000 tons of bituminous coal. As there seemed to be little likelihood of output catching up with demand, reliance was placed on securing less waste of coal in large plants and in curtailing unnecessary uses of power.

David Moffat Myers, advisory engineer of the Fuel Administration, in consultation with conservation committees and engineers, formulated a plan to reduce fuel waste in power-plant operation, not by costly installations of more efficient apparatus, but by a more intelligent and careful use of existing equipment. It was proposed to ascertain first how far each plant complied with certain well-recognized standards in its operation and maintenance, and then, by a system of rating degrees of efficiency, to force on the attention of the plant management such wasteful conditions as were disclosed. To supply a strong incentive for improvement, it was announced that the relative rating of plants would influence the Fuel Administration's allotment of coal should a shortage occur. The plan further included a programme of education through lectures, Government publications, meetings of plant owners, engineers and foremen. This campaign in each state was to be in the hands of an experienced power-plant engineer who, with his staff of workers, should be a part of the conservation division of the state Fuel Administration. Printed "Recommendations of the United States Fuel Administration" were issued establishing the standards of plant operation and maintenance as well as a questionnaire to ascertain from the power-plant owner the condition of his plant with relation to these recommendations, and to obtain the initial information for rating. It was an essential part of the plan that this information be confirmed or amended by an accredited inspector after investigation of the plant itself.

As a corollary to Dr. Garfield's frequent statements, that the railways were chiefly responsible for the deplorable situation, came the proclamation by the President on the night of Dec. 26 1917, by which the Government took over the railways. At this time the efforts to relieve congestion on the railways were beginning to bear fruit in the shape of a slight improvement in the car supply at the mines. On Jan. 16 1918 came the order shutting down business for five days and closing up industries on every Monday until March 25. The storm of protest which this evoked was far louder than any that had greeted the other revolutionary edicts of the Fuel Administrator. There had been no advance notice of the order, and following its publication the U.S. Senate, with only 19 adverse votes, passed a resolution, introduced by Senator Hitchcock, requesting a five-day suspension of the order to allow those opposing it to be heard. Nevertheless, the order was obeyed with a promptness that clearly showed the resolution of the public. On Feb. 13 1918 the order providing for "heatless" and "workless" Mondays was suspended. Although it was admitted in official circles that little coal had been saved by the order, it was generally acknowledged that it had stimulated the railway managers and had relieved to some extent the freight congestion.

After months of preparatory work, the Fuel Administration on March 22 1918 announced a zoning plan for the distribution of coal, to take effect April 1 1918. Every state in the Union was affected more or less. The aim was to confine coal produced in the eastern section of the United States to eastern markets, and make it compulsory for states in the Middle West, as well as in other sections, to use coal produced in mines near by. The announcement was received by the coal-mining industry with mixed feelings. Many operators and shippers who had spent years in building up their trade suddenly found their best customers taken from them. Consumers who had been accustomed to burning certain kinds of coal were forced to use fuels with which they were less familiar. But producers and consumers alike readjusted their methods to conform to the new order of things. The coal trade was still further convinced that the Government intended to control the entire output of fuel, from the time it left the mines until it was in the consumer's fuel pile. On March 11 1918 an order and emergency regulations were issued. The Secretary of War announced that coal jobsbers must procure licences. Many abuses had arisen which the Government desired to eliminate, and the licensing plan was announced as fair to the operator, to the bona-fide jobber and to the consumer. The new system enabled the retailer to buy direct from the producer, whereas he had before been able to deal with the jobber only.

With the railways under its control, the Government had made material progress in the task of clearing the path for a quick movement of coal from mine to consumer. New prices had been announced, and the local fuel administrators had perfected their organizations to take care of distribution. In many producing districts the coal supply was still below normal, however, and not sufficient motive-power was available. The railways had shown little improvement in the method of allotting empty cars to the mines. Before the Railroad Administration assumed control, it had been the practice of some railways to allot cars to those operators on their lines who favoured the carriers in respect of prices. John Skelton Williams, in charge of purchases for the Government-controlled railways, insisted that the Railroad Administration had the right to distribute cars where and how it pleased. This was a continuation of the old policy of using such control of shipping facilities as the railway possessed to force concessions in price from the coal producers, and it was in direct antagonism to the Fuel Administration's endeavour to further the production of fuel. Thus the Government body set at naught the edicts of another.

This action on the part of the Railroad Administration served as did nothing else to bring to the support of Dr. Garfield many of the coal operators who had been inimical. With the warmer weather of May 1918 came admonitions from the Fuel Administration that consumers would best serve their own interests, and those of the nation, if they laid in their winter coal supplies during summer. The production of both anthracite and bituminous coal had been steadily increasing, though inadequate car supply still prevented a maximum output of the latter. By June 1918 it had become apparent to those interested that the coal industry was being organized as it never had been before. The Fuel Administration, under Dr. Garfield, was accomplishing the seemingly impossible. Weekly reports kept him conversant with the actual output and consumption of coal in each zone, and a watch was kept on the needs of each section. Coal was in many instances diverted in transit to provide for emergencies. Quotas had been fixed for cities that were permitted to burn anthracite, none of which was to be sent west of the Mississippi or south of the Potomac or Ohio rivers. Industries deemed unessential to the winning of the war were being denied the use of any kind of coal. By July 1918 the coal industry was hard and fast in the grip of governmental regulations and administration. Competition had ceased. The railways and the fuel authorities were working together in harmony, and the bituminous mines, under the stimulus imparted by Dr. Garfield's newly formed production bureau, were producing record tonnages. The difficult task of inclining the soft-coal miners to greater endeavours was placed in the hands of James B. Neale, who had been acting as adviser to Dr. Garfield. In Aug. the Department of Labor classified coal-mining as "war work," in order to keep the
miners from leaving their tasks for other war industries, such as munitions and shipbuilding, where higher wages prevailed.

Conditions in the latter part of Aug. 1918 were about as follows:—That part of the United States lying roughly between the Rocky and Allegheny mountains appeared to be fairly well supplied with fuel, though Michigan was complaining of a shortage of domestic coal. The scarcity of coal seemed to be worst along either coast. New England, while admitting that coal was coming forward in adequate volume for immediate needs, nevertheless was apprehensive as to the future. On the Pacific coast, industries were somewhat short of fuel; although little anxiety was felt, it was anticipated that conditions would have a curious condition during the winter. By the middle of Oct. even the most carping critic was forced to admit that Federal control of the coal industry was beneficial. In charge of all production and distribution facilities, the Fuel Administration had carried out many of the plans which it had formulated early in the year. In the face of apparently insurmountable obstacles and of bitter criticism from many quarters, Dr. Garfield and his assistants had laboured steadily until disorder had given way to order. New England and a number of other important industrial centres had ample reserve stocks of industrial coal in that event. The Federal Administration of fuel conditions in winter, a complete reversal of the conditions that obtained in the autumn of 1917, a year earlier.

The need for quantity production of soft coal being less urgent, the Fuel Administration again turned its attention to quality. During the week ended Oct. 28 1918, orders were issued to a number of bituminous coal miners prohibiting them from mining or shipping their product, as it was of inferior quality. The Fuel Administration closed down 99 mines in its campaign for clean coal. Early in Nov. 1918 a surplus of soft coal was reported from practically every mine west of the Mississippi river, this unusual condition being attributable largely to the expectation of an early peace which led manufacturers of war goods to stop buying coal, and partly to exceptionally mild weather throughout the country. On Nov. 11 1918 the signing of the Armistice practically ended the activities of the Federal Fuel Administration. Government control of prices and other regulatory measures of the Fuel Administration were suspended Feb. 1 1919, but control of the coal industry was again established Oct. 30 1919, when all regulations were restored, in order to deal with the results of a strike in the soft-coal fields. These regulations were lifted on April 1 1920, when the coal industry was returned to its owners.

Apart from the phases of the conservation work carried on by the Fuel Administration as already described, other fuel-saving plans and recommendations were either discussed or put under way. These activities may be classified as follows:

**Interconnexion of power plant.—** This meant that municipal electric plants should connect with central stations; that isolated office-building plants, as well as industrial plants, should shut down and take power from central stations; and the interconnexion of hydro-electric plants with steam electric plants.

**Ship-stop.—** Many street-railway companies of the United States adopted the "ship-stop" system for the saving of fuel by passing many streets without a stop; steps were taken to decrease coal consumption by automatic control of heat on cars by the elimination of unnecessary street-railway service.

**Industrial gas.—** The managers of foundries and other industrial plants in sections of the country where artificial or natural gas was available, were induced to substitute this form of fuel for hard coal or coke. Many restaurant proprietors and bakers were persuaded to abandon solid fuel for gas.

**Domestic heating.—** Although domestic heating consumed only a small portion of the total coal output, methods of burning fuel in domestic heating equipments were improved, and faulty installations were corrected.

**Wood fuel.—** Various local Fuel Administrators devoted themselves to ascertaining where dead timber was obtainable and, through women's organizations, to securing it. Other volunteers, this fuel was saved and distributed, taking the place of coal.

**Lighting restrictions.—** The use of electric illumination for display purposes was curtailed.

Efforts in the direction of conservation ran from the smallest consumer, who carried his coal home in a pail, to the huge-consuming corporations in the large industrial cities. What the Federal Fuel Administration accomplished could not be accurately measured in terms of coal saved, though it may be stated that it amounted to many millions of tons. (F. W. P.)

**COAST DEFENCE** (see 6.590).—Broadly, the term "coast defence" might be said to include all military and naval measures taken to defend the sea-margin of a country against any attack by an enemy conveyed by vessels on or under the surface of the water. But the usual military meaning is a much narrower one, and may be taken to denote only the fixed defences of a coast and their various accessories. Even this requires qualification, since the sea-margin may be a very short one it is not practicable to defend it efficiently by any defences tied down to the coast-line concerned. The cost in men and material would be very great, and the whole, being rendered immobile, would be incapable of use in any other part of the theatre of war. So far as these forces were concerned initiative would always rest with the enemy who could attack or not as he liked. Victory lies with the attack and not with the mere parrying of a blow. Therefore, any country desiring victory must be prepared to strike, and for this reason must limit purely passive defence to its minimum, and devote most of its naval and coast forces to offensive operations. It is true that a country with very weak naval forces often tends to increase its coast defences as compared with another power possessing a strong navy. But even here this tendency should be carefully limited. The hostile navy will hardly ever be able to compel victory by itself; land operations will be necessary, and every effort should be made to conserve energy to combat these. The real defence of a coast, in the plain English of the words, lies in beating the enemy. The numerous coast guns on the east coast of the United States of America never fired a shot in the Spanish-American War; that coast was defended at the naval battle outside Santiago de Cuba. Practically the only time it may be said that coast defence, in the present military acceptance of the words, refers to the fixed defences at certain limited portions of a coast which, as will be seen later, are vital to the whole general lighting scheme of the country.

This view in its entirety has not always prevailed either in England or in other countries, and it may be said that the modern British scheme of coast defence has only been accepted since about 1885. Some years earlier the so-called Palmerston Commission, which commenced its sitting in 1859, had carried out a very large scheme of coast fortification which, although it concentrated the defences at certain important harbours, still was so far imbued with the theories of the past that it caused its works to be much too heavily gunned, and so locked up too many men and too much material.

Starting with the experience gained at the bombardment of Alexandria in 1882 the British school of thought on coast defence, as it existed before the World War, gradually took shape, and its ideas were crystallized largely owing to the influence of Sir George Clarke (Lord Sydenham). The World War has naturally caused changes in this as in every branch of the military art. Opinions are expressed to the effect that the whole scheme of coast defence must be radically changed, owing to the theory that surface craft are now so well armed that they are capable of remaining effective even after being hit many times, and that the weight of a future attack will come from the air or under the water. This is almost certainly to anticipate the future too rapidly. The use of aircraft and the expansion of the use of the submarine boat have undoubtedly caused great changes. But they are changes and not revolutions. History shows that no inventions in the past have ever caused sudden revolution in the art of war. It will be found that the new arm or the fresh invention take their places in the armoury of war alongside of, but at first not in place of, what has gone before. In time the old weapon may be discarded altogether, but sometimes this does not happen. In the matter under consideration surface craft must always be used for ordinary commercial purposes, as less energy is required to move a given mass floating on the water to which is necessary to move it in the air or completely submerged in the sea. These surface craft being in existence will certainly have to be used in warfare. Also, the
present stage of mechanical engineering, advanced as it may be considered to be, hardly warrants the belief that a surface war fleet, with all which it implies, can be completely replaced now by aircraft or submarines or a combination of both. The art of war is constantly changing, but by a gradual process, and many of the old views with modifications will be found to be sound in the future as in the past. Amongst these it is contended that the basic principles underlying British schemes of coast defence before the war will be found to have been of this sound nature, and that only require modification in detail.

In order to understand these general principles it is necessary to consider the whole question of the contest between the ship and the field of the modern range-finder and the modern battleship. These two contestants have never been on an equality, and that for various reasons which may be briefly recapitulated:

1. Gun Platform.—The shore gun is on an immovable platform while the naval gun is not. It may be taken that a shore gun presents a vertical target of about nine feet. This subtends an angle of slightly over 30 sec. at a range of 20,000 yards. Any gun correctly aimed at the centre of this target a movement of the gun of 15 sec. in the vertical plane containing the trajectory of the shell at the moment of firing would be sufficient to throw the gun off the line of fire. In the case of the modern range-finder the target is so remote that this criterion may be almost imperceptible on a ship. Such a movement is almost imperceptible on a ship.

2. Control of Fire.—On a ship the means of range-finding are necessarily restricted within the dimensions of the ship and its masts, while the shore gun has the whole coast within the limits of its range. The modern range-finder can be used only in a very limited area of land for range-finding. It is not clear that in these days aircraft can be used for correcting fire, but the results of this are not so accurate as those from terrestrial instruments, and these in any case are of but short range.

3. Ammunition.—The supply of ammunition of the shore gun is naturally kept up more readily than that of the gun aloft.

4. Visibility of Target.—So long as a ship is within the horizon it cannot conceal itself except by means of a smoke screen. This latter has disadvantages from the point of view of offensive action from the ship. A shore gun on the contrary can be rendered very inconspicuous, and in many cases may be invisible from the sea beyond the horizon. The modern range-finder, being land-based, is not affected by this invisible cloud.

5. Target.—Apart from the visibility of the respective targets their vulnerability differs. It is not difficult to design a shore battery so that only a direct hit on the gun itself will put it out of action, all other parts of the battery being fully protected. At Tsingtao on Oct. 29, 1914 ten large shell from H.M.S. "Triumph" were observed to burst just inside Fort Hill, but none of the guns of the fort were damaged. With the ship, on the contrary, there are many parts other than the guns, damage to which would materially affect its fighting efficiency. Examples of this occurred on March 18, 1915 in the Dardanelles.

To a certain extent these unequal conditions have always existed, but when they are examined it will be seen that the increase of power of artillery and improved methods of range-finding has made it more and more at a disadvantage. When the effective range of artillery was about 1,000 yd. it was very difficult to make anything inconspicuous on shore, and range-finding instruments did not exist at that time. In these days of ranges of 30,000 yd. and more, shore guns become practically invisible from a ship even if they are in direct view from the sea, and range-finders may be situated several miles away from the guns they serve and give no indication of their presence. It is true that with modern ranges it cannot be expected that shooting can be very constant; there are too many factors to prevent it. But this fact is a great advantage to the modern naval gun as its rival on shore. Guns are not mathematical instruments. Their shooting powers are affected by very slight variations of propellant charge in quality and quantity, of weight of projectile, of the amount by which the latter is rammed home in the bore, and by the wear of the gun itself, not to speak of change of atmospheric conditions and wind. The Battle of Jutland brought out the fact that a large number of shell are required even to hit a ship, and still more would be needed to hit such a target as a shore gun.

In one other point also modern ships are at a great disadvantage than their predecessors in a contest against a shore battery in the fact that they possess a smaller number of guns. If it be granted that a direct hit is necessary to put a shore gun out of action then the more guns which are available to fire at it the greater the chance of hitting. During the World War a number of British monitors were built and used for bombarding the German batteries on the Belgian coast. While they possessed many advantages in their design which tended to render them less vulnerable, they had the grave disadvantage of an armament small in number.

Except in special cases ships are built to fight other ships and not to fight coast batteries, and it would seem to be admitted now that naval fire can never be effective against such small targets, and that it is better to reserve it, in action against the shore, for firing upon areas such as docks or dockyards.

If a fleet was determined, regardless of loss, to come to really close quarters with coast defences, some of the advantages of the shore gun would undoubtedly be minimized. But the modern range-finder would render such an operation in day-time extremely hazardous to the fleet, apart from any action by submarines on the front of the defender, while at night it is difficult to see what object could be attained, apart from such a special attack as was carried out at Zeebrugge.

Very many actions have been fought between ships and batteries, and a few of the most instructive may be mentioned here.

The German battleship, three lighter vessels and two steam gunboats attacked the Prussian defences, which comprised two batteries containing two 8-in. guns, two 24-pdr.s, and six 18-pdr.s, assisted by one field battery of six guns, all three batteries being up the water's edge on low sites. After a long action at short ranges, the battleship and one frigate surrendered and the remaining ships retired, all having suffered severely. The casualties in the batteries were due to the large number of guns, it being necessary to protect the defences, or the forces were much greater than the defenders.

One of the most instructive instances in the past was the naval attack on Sevastopol in 1854. There the British in-shore squadron of five battleships engaged a land-based fort, the men-of-war being casemated forts with parapet casemates, and batteries of 18-in. guns. The British ships fired in-shore, the fort having the advantage of three guns on each side of a small hill, the other two having large guns on the sea front.

From a range of 800 yd., 22 out of the 27 barbettes guns of Fort Constantine were silenced in a very short time by the fire of three ships. Slightly later the whole fort was silenced, and the heavy defences in the land were of no consequence. But the other two batteries caused the retirement of the whole squadron with considerable loss, while they themselves suffered very little, the Wasp battery having one gun upset and 22 men wounded while the Telegraph sustained no loss at all.

In the action at Alexandria in 1882 the conditions were almost wholly in favour of the ships, namely, smooth water, works not only 25, very low sites close to the water but lastly designed, a poor armament and inept gunners; yet the shooting of the ships had little real effect, and against better troops the fleet would hardly have gained its object. This was due, no doubt, principally to the nature of the naval gun, which had the advantage of a very large extent of slow-shooting heavy guns, few in number, while the shore guns were well dispersed.

While the World War was in progress it was sometimes argued, as it had been in past periods, that present-day naval artillery is so powerful that it would reverse the lessons of the past. But the experiences of the war have only emphasized those of its predecessors. At Gallipoli, the batteries of enemy and of the Germans are the batteries erected by the Germans on the Belgian coast.

The number of these actions was at least 40, and yet no gun, mounting or magazine of these numerous batteries was ever hit. The naval operations in the Dardanelles, on March 18, 1915, a deliberate attack was made on the main batteries of the defence near the Narrows by 16 battleships, at the comparatively short ranges of from 10,000 to 14,000 yards. The Turkish batteries and guns were old, the works were badly sited, as a rule close to the water, and their high traverses rendered them very conspicuous. At the end of the day three battleships had been sunk by mines and three others had been damaged by shell-fire as to necessitate immediate withdrawal to a dockyard.

The damage to the batteries was very small. For instance, the old Hamide 1 battery near Chanak, which maintained three 14-in. and two 6-in. guns, and two 3-in. disenabled, and the latter put out of action and suffered some losses in its garrison. A war-time battery of five 6-in. guns at Dardanels, near the top of a conspicuous hill some 150 ft. high, after the attack was in a comparatively good state. The only result was that three guns-shields were dented by splinters.

A general summary having been given of the conditions of the combat between ships and shore batteries in the past, the point next to be considered is what are the objects to be attained by coast defences today.

In order that the navy shall be free to carry out its true function of attacking the enemy's naval forces and keeping clear the ocean lines of communication of the country, it must not be
COAST DEFENCE

717

hampered by having to think of guarding its own bases against any attack likely to be made on them. If it had to do this its mobility would be lost. Naval bases, where ships can renew their fuel supplies, ammunition and stores of all sorts, and where they can repair damage, must be self-protected. Similarly, it is advantageous that certain commercial ports where a country receives large overseas traffic or where convoys are assembled for dispatch should be self-protected. Also, for strategical reasons certain harbours should be self-protected, where naval squadrons can lie at ease without jeopardizing their own safety or risk being caught like rats in a trap.

It is at parts of the above description that “coast defences” find their real use, and while, as stated above, such defences should be kept down to a minimum, they must be capable of doing their protective work effectively. The necessary scale of defence will vary with every nation; and, with the far-flung possessions of the British Empire and any country with overseas dependencies, the requirements will vary in every case. Many factors must be taken into account. The strength of the naval forces of a country in question, the strength of the naval forces of any possible enemy, the geographical position of the harbour in consideration with respect to the enemy and with respect to the main forces of the country to which it belongs— all these points must be duly weighed in deciding on the scale of defences to be adopted, as well as the particular role which the harbour is intended to fill in the general fighting scheme.

Fixed defences may be said to form a part of the scheme for utilizing the naval forces of a country, and it has been argued that these defences should be manned and controlled by the navy. In a few countries this is the practice, but in the majority it is not, and it would seem that the latter are right for the following reasons: the service and control of artillery ashore differs greatly from those of artillery in coast batteries, the nature of artillery in such batteries is not very different from that in heavy batteries in land warfare. Therefore it would seem advisable to have coast batteries manned by land gunners and not by naval gunners. History has shown that the defences on the land side of a coast fortress are often the door by which an enemy seeks to enter, e.g., Sebastopol, Port Arthur, Tsingtao, and the Dardanelles in the World War. These land defences are very intimately connected with the fixed coast defences and also with the field land forces, which must form a part of the army and not of the navy. It is evident then that in the general scheme of defence of a defended port there must be some line of demarcation between naval and military control, involving the closest cooperation between the two wherever that line of demarcation is drawn. For these reasons alone it is argued that the proper line of demarcation should be that provided by nature, namely, the edge of the sea.

Adaptation of Coast Defences to Local Conditions.—While coast defences will vary according to the scale on which they are based, they will also vary according to the local conditions of the place to which they are applied. These local conditions, apart from topographical considerations, fall into three main classes: (1) Defence of a harbour; (2) Defence of a landing place; (3) Defence of a coast position connected with a landing place. The greater number of cases will come within the first class.

(1) Defence of a Harbour.—This may be a naval port, a commercial harbour or a strategical anchorage. The scale having been determined upon, the coast defences necessary will depend upon the different forms of attack to which the harbour may be exposed. Attack on the land side of the harbour by forces landed outside its rayon is omitted here, as it is a branch of land warfare and is dealt with elsewhere. It is sufficient to remark that in the past this has often been the most effective form of attack on a defended harbour. With this omission it may be said that the forms of attack are: (a) Bombardment; (b) Attempts to block narrow parts of the approach channel by sinking ships in the fairway and so sealing up the harbour; (c) Close attack by small torpedo craft on ships or dockgates, probably at night.

(a) Bombardment.—This form of attack may be taken to include not only bombardment of the object for which the harbour exists, such as a dockyard or anchorage, but also action, analogous to counter-battery in land warfare, against the batteries protecting the harbour, as, in the event of bombardment these batteries naturally come into play. The positions of these batteries will largely depend upon the topography of the environs. There are two general types of harbours, namely, one with an approach channel, which may be either long or short and broad or narrow, or one where the coast-line is to all intents a straight line, the harbour being formed by a slight indentation of the coast, or by artificial breakwaters.

Whenever possible the batteries should be pushed out as far as possible from the reach of fire of the whole of a broad channel, e.g., where the coast-line is to all intents a straight line, the harbour being formed by a slight indentation of the coast, or by artificial breakwaters.

This, however, is not always possible, and in the event of a straight coast-line the enemy will be practically equidistant from the batteries and from the object of their defence. This will undoubtedly be a great disadvantage to the batteries, and the number of guns will have to be greater than usual in order to occupy fully the attention of the hostile vessels.

In the past, when the range of artillery was shorter, it was sometimes necessary to construct forts in the sea itself in order to protect their fire. Battered with single guns, these forts will bring an effective fire to bear on the ships at much less than extreme ranges, before the latter come within bombing range.

The experiences of the World War have shown that the number of guns required to defend a harbour is even less than it used to be. Enemy ships for one thing will be chary of approaching too close on account of mines, submarines and electrically-controlled torpedo craft, and the great superiority of modern land range FINDERS over ship range-FINDERS will ensure greater accuracy on the part of the shore guns. These latter should be well dispersed and should be able at the same time to control their fire. Battered with single guns they will have their advantages, but there would always be the chance of a lucky hit from the sea putting the gun out of action and so silencing the fire from a portion of the defence. It is probable then that there will be always two guns in a battery, but they will be well separated by about 200 yd. or even more.

Form of Batteries.—The form that batteries will take will undoubtedly be influenced by the lessons of the war. Taking into consideration the long ranges in use and the dislike of ships to come close in, there are many advantages to be gained by making primary batteries into indirect-fire batteries, sitting them where they will be unseen from the sea and controlling their fire at all times by some system of positioning that is independent of observation. The advantages so gained would be, increased protection from hostile fire, much greater latitude in the choice of sites, a great simplification in design due to the protection the battle ships can give the battery, and probably easier work to the battery. The disadvantages are, loss of range, a certain area of dead water in the foreground of the battery, and the impossibility of fighting the guns in the event of the means of control of fire breaking down. The loss of range would be unavoidable but the amount would be small. The area of dead water would depend upon the topography of the coastal region (it is always assumed that the dead water is navigable). In very many cases it can be covered by the fire from another battery. Should this not be the case it might be necessary to install a direct-fire battery ad hoc, which possibly might be able also to fulfill one of the duties of secondary batteries in another part of the area. Moreover the third disadvantage, adequate protection for the communications of the fire-control system, together possibly with its duplication, would seem to reduce the contingency of this breakdown to a negligible point.

All the primary batteries erected by the Germans on the Belgian coast were for indirect-fire. After the evacuation by the Allies of
The Gallipoli Peninsula the Germans commenced the construction of an indirect-fire battery inland from Cape Helles, which was not quite finished at the end of the war, while at the Black Sea end, the Germans built a central battery, consisting of four field pieces on the Bosphorus, which were in such a position as to be able to command the Black Sea to the west of the Bosphorus, while in the event of vessels trying to force the entrance the guns could use direct fire at a comparatively short range.

**Guns.**—There is a certain amount of disagreement as regards the size of guns required in coast batteries. In the case of a straight coast-line the guns must be powerful enough and positioned so as to engage the enemy's ships, or at all events to make them confine their efforts to replying to the batteries. This means that they must be equal in ranging power to the guns of the enemy.

Whatever the gun may be, however, it is not really necessary that the coast guns should be as long-ranging as those of the ships. They only require to have sufficient range to enable them to bring damage to the ships before they come within bombarding range of the objective. To obtain long range it is also not really essential to have guns of very large calibre, although the life of a large gun is shorter because of the greater strain to which they are subjected. Also, the shell fired by a coast gun must have a real effect on a ship. But at the range at which actions are now fought the angle of descent is so great that the deck is more often than not the place where a hit will be felt. A gun of this type is used in this way, it is not very good. On the Belgian coast the Germans had five 15-in., six 12-in., and a number of 11-in., but it seems questionable whether, provided sufficient range can be economically obtained, the two latter would be better required by the batteries. Here a gun that is not powerful enough for a coast battery against any kind of vessel. As already stated, it is necessary to reduce to a minimum the ammunition required to cover modern anti-ship defences, and the smaller the gun the greater the economy in both.

It has often been advocated that guns on railway mountings should be used for coast defence, and at first sight they appear to be most attractive. They can be moved from one place to another, mounted on rails for rapid transit, and the battery can be placed in position in a much shorter time than is possible for the movement of mobile coast guns. Under existing conditions, however, in having mobile coast guns, desirably, the shell fired by a coast gun must have a real effect on a ship. But at the range at which actions are now fought the angle of descent is so great that the deck is more often than not the place where a hit will be felt. A gun of this type is used in this way, it is not very good. On the Belgian coast the Germans had five 15-in., six 12-in., and a number of 11-in., but it seems questionable whether, provided sufficient range can be economically obtained, the two latter would be better required by the batteries. Here a gun that is not powerful enough for a coast battery against any kind of vessel. As already stated, it is necessary to reduce to a minimum the ammunition required to cover modern anti-ship defences, and the smaller the gun the greater the economy in both.

For the modern coast-defence gun it is essential that the best possible means of range-finding be employed. Many instruments have been used for the purpose. Some are adapted to use against the target, and others termed position-finders give the actual position of the target on a chart of suitable scale and therefore its relation to the gun position, which is also marked on the chart.

The shell and the men and equipment must be in direct view of the sea, and from the position of the gun battery in which they are situated, the feeders are given the indivisible. The receiving instrument should be somewhere near the battery: if an indirect-fire battery it should be nearly straight in front of it. For economy, principally, it is customary for one pair of instruments to suffice for all the guns of a battery, with one exception only, viz., that the direct-feeding lines are by various instruments, such work required a knowledge of it may not be possible, and the feeders of other guns are laid by previously worked-out corrections (known as group differences) upon the training of the master gun.

In order that the instruments can have sufficient range of vision it is necessary that they should be mounted higher than the highest point to which the guns can be put up. In fact, for the correct range of the gun, the instrument must be mounted as high as possible. The higher of three corresponding pieces a lesser height would serve, as the target ship will have some height above horizon. For instance, the records of a minor engagement between a German 11-in. battery near Blankenberge, Belgium, and one of our 15-in. batteries in the north of France show that the range used by the battery was 27,000 yards. The instrumental system was a long-base position-finding one. The base was 9,454 yd., and the receiving instrument 110 ft. above sea-level, on the top of an 8-ft. tower. The transmitted instrument at the battery was on the top of the instrument being 90 ft. above sea-level. This latter height has a sea horizon of 22,000 yd., but the battery was 1,670 yd. back from the horizon. Thus the transmitter was laid on a target more than a mile beyond its sea horizon.

The Germans made great use of the tall buildings on the Belgian coast for their observing instruments, but it may be necessary to use them in the future.

The question of visibility is a very important one in the matter of range-finding, especially in such a climate as that of Great Britain. There are many days on the British coasts when a view of anything in the distance can only be obtained on the top of high buildings or by means of instruments. Such are often low-lying, and it might be possible to overcome them by the use of captive balloons. Another means of correcting fire is the employment of aircraft, which may be used by both sides in the war, and they might be for the observation of the enemy, and the number of observations is naturally far less than that from instruments.

Self-contained instruments (such as the Barr and Stroud and the Vickers) have been used in the Russian and German forces only. They were supplied in large number to the German batteries on the Belgian coast, but the records show that they were not relied on for long ranges, but regarded as stand-bys in the event of anything in the way of a defective instrument.

**Design of Batteries.**—The experiences of the World War show that the battery of the future can be greatly simplified. No longer need it be regarded as a fort, and the fact can be frankly accepted that the fire-power of the vessels on the horizon was so great that the batteries might be designed accordingly. The guns require their stable platforms of concrete, but parapets are not necessary. Ammunition can be stored in light weather-proof structures or in covered railway wagons on a feeding railway, protection being sought by dispersal rather than by thickness of covering. The supply of ammunition to the guns must naturally be made as easy as possible, and great use can be made of light tramways.

This type of battery was used by the Germans in Belgium in the later stages of the war. At first their batteries were all of the type in use before the war, with heavy concrete and earth protection. But after the magazine bombs received widespread damage, the Germans abandoned all material protection. Also, while the earlier range-finding stations had thick concrete protection, the later stations were built on the more economical method.

**Effect of Aircraft.**—The war has introduced a new arm which cannot be ignored in any branch of the military art, namely, the air service. As already mentioned, aircraft can and will be used for correction if the fire is not as good as it should be. It is also necessary to consider the offensive action of aircraft against batteries. Unless the aircraft can descend low enough to make use of machine-gun fire this action will consist of bomb-dropping. The use of bombs is very similar to the use of long-range large shell, and, at all events up to the present, it is extremely difficult with bombs to obtain any accuracy against small targets. The-firing of battery very far from the visual of the fighter pilot is about 12 yd. in diameter. If an aircraft were travelling at a speed of 120 m.p.h., in order to get a direct hit on such a target the bomb must be released at an exact point of a second, the plane must be flying exactly in the line of the shell, and there must be wind in all, or at all events no variation in the wind, during the descent of the bomb. All these conditions are very difficult to fulfil conjointly, but practically only direct hits will put the gun out of action. It is, therefore, quite impossible that the guns of any modern system should be so placed that it is not required. It would be possible to fire on the aircraft, but the only material protection given to the aircraft is the anti-aircraft guns. However, the main protection of batteries against aerial attack will lie in the use of anti-aircraft and of anti-aircraft guns. Even with the latter only hostile craft will have to keep high up, and the guns of their own and the cruiser will, therefore, be protected. The high battery must be in the ray of any anti-aircraft guns.
Direct-Fire Batteries.—Under certain circumstances it may be impossible to site a primary battery in a position concealed from the sea. It may have to be a direct-fire battery. In this case it should, if possible, be on a high site in order to facilitate both observation and gun-laying. Near the battery may be a lighter which would render it less easy to hit. Since the guns will be visible from the sea every endeavour must be made to render them as bad targets as possible, by having nothing above the line of the battery as seen from the sea. The essential point is that they must have a background. This may exist naturally, but, if not, an artificial background must be provided with an outline in keeping with the vicinity.

A regard for protection storage expenses has led to the adoption of the scheme of small dispersed expense stores with tramway communications to the guns, combined with small dumps in or near the gun emplacements for immediate use.

(b) Blockship Attack.—Hitherto only the primary batteries have been considered her protective action against bombardment, but there are the other possible forms of attack, which necessitate the use of secondary batteries of lighter guns. One of these is attack by blockships in order to seal up a harbour. This is possible only where there is a very narrow channel which is to seaward of the important part of the harbour. For instance, there are the entrances to the harbours of Santiago de Cuba and Port Arthur, and to the Bruges ship canal at Zeebrugge. These were all attacked in modern times; the attempts made by the American and Japanese navies respectively were unsuccessful, while at Zeebrugge the British attack succeeded.

Secondary batteries are always made by night, and old warships would often be used for the purpose. This means that the time available for stopping the ships would be very short, and the feat is not to be accomplished easily. But they should be stopped before they reach the bottleneck of the channel.

The defence guns must have a rapid rate of fire with good shell-power, and the means of illuminating the approaches must be the best possible. It may well be also that, in certain cases, torpedoes fired from the shore would prove effective. The guns need not be of the heaviest calibre, but nothing under a 6-in. gun is advisable. The success of any action for this purpose requires very little consideration. In the dark there is little chance of direct hits on them, while shrapnel can be guarded against by light gun-shields. Such guns, and all secondary armament, should be direct-fire, with automatic sights.

The successful blocking of the Bruges ship canal on April 23, 1918 is an excellent instance of the fact that a fleet, which is determined to come to close quarters with coast defences, will most surely find a way if the key points are not properly sited. Most of the German guns were sited as if they were meant to defend the water outside the mole, and none seemed to have been sited close to the entrance to the harbour. The Germans quite realized the possibility of such a form of attack. The searchlights were sited similarly; there was no concentration of illumination at the spot where the guns could have been certain of hitting. On the other hand the guns were crowded with machine-guns, trench mortars and rifles, some machine-guns being only 50 yd. from the final positions of the blockships. These weapons were of no use in stopping the ships, but were admirably placed for killing the crews, who, in leaving the ships, were completely exposed. That the losses amongst the crews of the blockships and the motor-boats were small can only be put down to the theory that “Fortune favours the brave.”

(c) Close Torpedo Attack.—Another form of close attack is by small craft such as destroyers, torpedo-boats or motor craft, which would attempt to run in at night and attack ships at anchor inside a harbour, or dockgates, using the torpedo as their main weapon. Here the question of the electric lights (see 6.001) is of primary importance. To stop such an attack secondary batteries are required. The guns of these batteries will have to possess increased shell-power compared with those previously in use, in order to keep pace with the greater protection and greater speed now given to torpedo craft. This increase in speed gives less time for the shore guns to get in their hits, and therefore it is essential that each shell should have good destructive effect. Whenever possible very low sites should not be used for secondary batteries. A certain height facilitates the use of automatic sights with the guns and favours observation of fire, and the guns are better enabled to see their target in the beams of the electric lights. However, it must be remembered that no dead water is permissible with these batteries, and that the limit of navigable water is nearer the shore for light craft than for larger ships. Therefore, there are limits to the height at which secondary batteries should be placed, taking into account the angle of depression obtainable with the guns.

With an illuminated area of water it is generally not possible to bring an effective fire on torpedo craft at a greater range than 1,000 yd., because, at such range, the searchlights are insufficient to give the gunners sights to be used effectively. While foggy weather would probably interfere with an attack of this nature some craft might try to take advantage of the obscurity of the lights and creep in. In such a case sound-rangering, especially sub-aqueous, a new method of position-finding produced by the war, could be profitably employed to ascertain the position of any such craft and allow a fairly accurate fire to be developed against it.

It is probable, however, that modern conditions will render this form of attack less likely in the future than it was thought to be in the past. Still another form of it may have to be taken into account should the use of torpedoes from aircraft attain the success which its advocates prophesy. Here the direction of approach of the enemy is not limited to a navigable channel, as the aircraft may descend from any quarter of the heavens. The defence against this modern phase is practically the general case of defence against any aircraft, except that the planes should be attacked as soon as possible before they have a chance to release their torpedoes. Also, they will be most likely to effect a release where their torpedoes will have to be launched against their own ships.

(2) Defence of a Channel.—Here the word channel is meant to imply a comparatively narrow stretch of water which has open or nearly open water at either end, the passage of which it is desired to bar to an enemy. Such channels as the Straits of Messina, the Straits of Shimonosoki, the Dardanelles and the Bosporus would come within the meaning. Also it may be taken to include harbours having a long channel of approach and a wide stretch of water inside the channel.

A fair number of cases in which such channels have been fortified and attacked have occurred in history. Not to go too far back, in 1807, a British squadron under sail forced the Dardanelle channel at which point the batteries were formidable, and a fire brigand was destroyed. In 1863 the Turks concentrated a large force of batteries on the Dardanelles, and in the case of the passage of the Federal squadron under Farragut at Vicksburg on the Mississippi in 1863. The ships were slow and the current was swift, the navigation was not easy, the range was short and the guns were well-sited. But the squadron passed the town not once but several times. The great use of mines and the increased force of gun-fire were relied on their batteries only, no obstacles being placed in the river.

The World War produced a notable instance of this class of operation in the attempts of the British and French fleets to force the passage of the Dardanelles. Here the current is swift but the ships had greater speed than those of 1863. The Turkish batteries were certainly numerous but the guns were not up to date, and the batteries were generally badly sited and designed. The Turks did not depend upon their guns only; they made extensive use of obstacles in the shape of submarine mines.

A desultory bombardment took place on Nov. 3, 1914, but the real attack did not begin till Feb. 19, 1915. The entrance to the Straits was gained and operations continued inside, culminating in the great attack on the main batteries near the Narrows on March 18, 1915. In his despatches the British admiral states that the withdrawal of the ships was due to the menace of the mines. It may be said that the backbone of the defence was the minefields. Until they were removed the ships were hampered in their movements and could not deal properly with the batteries protecting the minefields; also the ships could not remove the mines until the protecting batteries were silenced. The attack of March 18 was a failure.

It is possible and even probable that if the Turkish batteries had been of a modern pattern and had possessed proper rangefinding appliances (the Germans added these afterwards) the shore guns might have played a larger part than they did, and this point should be remembered should similar operations take
place in the future. If the ships are intent on forcing a channel ranges will naturally become short and the fire of the shore guns will become very accurate. The small battery at Hartlepool which fought the German squadron on Dec. 16 1914 undoubtedly left its mark on the enemy vessels.

The outstanding lesson of the naval operations in the Dardanelles would seem to be a very old one—that men are more than material, that even moderately armed and organized defences, when manned by stout-hearted troops, as the Turks undoubtedly were, although not well trained technically, can still have in them a very great power of resistance, provided the tactical organization of the defence is not radically unsound.

It has been mentioned with reference to the Dardanelles that minefields may play an important part in the defence of a channel. Such minefields, although they may, by the active presence of the mines, do great damage to a ship which strikes one, may be removed by sweeping or countermining, and really form an “obstacle” in the military sense of the word which to be effective must be protected by fire. It will therefore be necessary to arrange that minefields are under the effective fire of batteries. The guns of such batteries would probably be about the same size as those for dealing with torpedo craft, as the vessels used in attempts to remove mine cases from a channel if possible, would be expected to be protected from the fire of the larger hostile ships. This was done at the Dardanelles by taking advantage of the projecting points of land on both the European and Asiatic shores. As mine-sweeping would generally take place at night electric lights must be provided specially for the use of the minefield batteries.

(3) Defence of a Landing-Place.—In certain cases it may be necessary to prepare defences against the chance of an enemy landing on a stretch of coast. It would rarely be possible to hold such a line in any strength, nor would such a course be desirable, as it would mean locking up troops for an indefinite period, but while there must be arrangements for repelling a landing, a stronger line of defence must be taken advantage of. Suitable defences can play an important part by enabling small bodies of men to hold up an attack until reinforcements arrive, but for deliberate preparations to defend all possible landing-places the expenditure of men and materials will always be prohibitive. Such measures can be taken only in the case of very important places.

The line of coast to be dealt with may or may not lie within the rayon of a coast fortress. If it does there may be some guns of the fortress capable of bearing on the water in front of the coast to be defended, and their fire will be of the greatest value against large craft, but in that case the method of being continually on the alert for landing would be received. Suitable defences can play an important part by enabling small bodies of men to hold up an attack until reinforcements arrive, but for deliberate preparations to defend all possible landing-places the expenditure of men and materials will always be prohibitive. Such measures can be taken only in the case of very important places.

of Fergusie, younger brother of the founders of the firm, assumed by royal licence the surname Glen-Coats when created a baronet in 1804. He succeeded Archibald Coats as chairman of the firm and sat in the House of Commons for W. Renfrewshire from 1866 to 1810. His elder brother, James Coats (1814–1872), was the owner of the Coats libraries, 7,000 of which were sent to villages and schools in Scotland. Each consisted of a bookcase containing about 400 volumes, and the school-children were provided with satchels for carrying the books to and fro. Spec-
tacles to the number of about 50,000 were also supplied under the direction of a qualified oculist, to readers who needed them. Similar libraries were sent to places abroad, such as Smyrna, Cairo, Jerusalem, etc. No endowment was, however, provided, and the libraries, at first much appreciated, fell into disuse.

A younger brother, George Coats (1849–1918), also a director of the firm, was raised to the peerage in 1916 as Baron Glentanan. He died at Glentanan, Aboyne, Aberdeenshire, Nov. 26, 1918, and was succeeded by his son, Thomas Coats (b. 1894).

COCHERY, GEORGES CHARLES PAUL (1855-1914), French politician (see 6.619), died in Paris Aug. 8 1914.

CODY, WILLIAM FREDERICK (1846-1917), American scout and showman (see 6.637), died in Denver, Col., Jan. 10, 1917. He was buried in a tomb blasted from solid rock on Lookout Moun-
tain, 20 m. from that city.

COHN, GUSTAV (1840-1919), German national economist (see 6.652), died in Sept. 1910, at Göttingen.

COLOMANNI, NAPOLEONE (1847-1902) of Italian author and politician, was born at Castrogiovanni (Sicily) in 1847. He followed Garibaldi in his Sicilian expedition, and later at Aspromonte, when he was taken prisoner by the Royal troops and deported to Palmaria. Again in 1866 he fought under Garibaldi in the Tren-
tino and was decorated with a silver medal for valour. Three years later, while a medical student, he was imprisoned for taking part in republican agitation. After graduating in medi-
cine he took up the study of social science, and in 1892 was appointed professor of statistics at the university of Palermo. He published many books and essays on social and political problems, and exposed the fallacious and unscientiﬁc theories of Lombroso and Ferri on criminology. For many years he edited the Rivista popolare, by means of which he strove to improve the moral and intellectual standard of the masses and combated all forms of intolerance and hypocrisy. He began his public career as a municipal councillor in his native town in 1872; in 1882 he was elected provincial councillor and in 1890 deputy for the same place. In Parliament he sat as a Republican and showed Socialist tendencies. He was active in the exposure of the Banca Romana scandal, and a strong opponent of Crispi’s somewhat autocratic tendencies. While he had always opposed militarism and had also attacked the army with much animus, on the outbreak of the World War he admitted his error in that connexion and became a warm supporter of Italian intervention. After the Armistice he conducted a vigorous campaign against the Socialist organ Avanti and the bolshevist tendencies of the Italian Socialist party. He died at Castrogiovanni Sept. 2 1921.

COLBY, BAINBRIDGE (1869- ), American politician, was born at St. Louis Dec. 22 1869. After graduating from Williams College in 1890, he studied at the Columbia Law School and the New York Law School. He began to practise in 1892 in New York. He was counsel for Mark Twain in settling the affairs of the publishing house of Chas. L. Webster & Co. He was a member of the New York Assembly, 1901-2. He was an ardent supporter of the candidacy of Theodore Roosevelt for the Republican presidential nomination in 1912, and was in charge of the contests for seating the Roosevelt delegates in the national convention. Following the split in the Republican party he became one of the founders of the National Progressive party and was a delegate at its national convention in 1912. He was an unsuccessful candidate for the U.S. Senate from New York on this party’s ticket in 1914 and 1916. He was appointed a commissioner of the U.S. Shipping Board, and a member of the U.S. Shipping Board Emergency Fleet Corp. 1917-9. He was likewise a member of the American mission to the Inter-Allied Conference at Paris in 1917. In Feb. 1920 he was appointed Secretary of State to succeed Robert L. Wilson, by President Wilson, to whose administration he had given his support.

COOKIDGE-TAYLOR, SAMUEL (1875-1912), British musical composer, was of Anglo-African parentage, his father being a native of Sierra Leone and his mother an Englishwoman. He was educated at the Royal College of Music in London, entering as a violinist in 1891. In 1893 he won an open scholar-
ship for composition, and studied for four years under Sir Charles Stanford. In 1898 his cantata, Hiawatha’s Wedding Feast, was produced in London with marked success, and was followed by two other cantatas, The Death of Minnehaha and The Departure of Hiawatha (see 19.53). This trilogy was first given complete at the Albert Hall, London, in 1900. The Blind Girl of Casial Cuillé was given at Leeds in 1901, Meg Blane at Sheffield in 1902, and an oratorio, The Abenominy, at Hereford in 1903. He also produced Endymion’s Dream and the Bon-Bon suite (1908-9), and A Tale of Old Japan (1911). He died at Croydon Sept. 1 1912.

COLLCUTT, THOMAS EDWARD (1840- ), English architect, was born March 16 1840. After a pupillage with R. W. Armstrong, he entered the office of G. E. Street, where he re-
ained as chief assistant for three years. The time spent under so strong and impressing an inﬂuence had, however, little effect on his own work and design in the future, which never went along Gothic lines, but always spoke his own predilection for a free and personal treatment of Renaissance work—owing more, perhaps, to French than to Italian suggestion. To this method he was, throughout his career, strongly attached, and his designs, shaped on these lines yet speaking his own individuality, had a pro-
nounced inﬂuence on the current work of the English architects of the last quarter of the 19th century. It was at the beginning of this period that Collcutt made himself felt in helping forward the movement to which at the same time William Morris was devoting himself—for a highly raised standard in the considera-
tion of the interior treatment and furniture of the English house. Under, and for, the then well-known firm of Collinson & Lock he carried out the decorative work to, and furniture for, many houses in various parts of the country, a preparation of value to him at a somewhat later period when he was one of the first artists to be asked to help in a worthier treatment of the interior decoration of the ships of the large steamship companies. In this capacity he dealt with a considerable number of the P. and O. steamships. It was in 1872 that T. E. Collcutt carried out his first important building—the free library at Blackburn, the commission for which he obtained, as was the case with much of his subsequent work, by a spirited and brilliant design which was successful in a large competition. The even more important town hall in Wakefield, obtained in the same manner, followed a few years later, and is an example of Collcutt’s skill in arrangement of plan. His most noteworthy building, however, is the Imperial Institute, London, founded in 1856 by King Edward VII., then Prince of Wales, as a national memorial of the jubilee of his mother’s reign. The new building faces on a road formed across the site of the Horticultural Gardens, the whole of the area of which it occupies, and its free and open position, thus obtained, gives it an advantage uncommon amongst modern London buildings. Its elevational treatment speaks the grace and reﬁne-
ment characteristic of the architect’s work, and is based on his usual suggestion of verticality by means of non-ordered pilasters the whole height of the building. Its style is of a free Renaissance type, with details such as cornices and strings perhaps, as some critics say, on somewhat too small and delicate a scale. It never-
thless stands out as a successful achievement in modern English architecture, and one upon which the artist’s signature is clearly written. With very much the same character and feeling Collcutt designed the Royal opera house, London—later known as the Palace theatre—making much use of marble and alabaster as decorative material for the interior, and later on he carried out the Savoy hotel, another instance of his careful plan arrange-
ment. He was elected a president of the Royal Institute of
British Architects in 1906; he received that society's gold medal in 1902, and three years earlier was awarded the Grand Prix for architecture in connexion with his artistic services at the Paris Exhibition.

COLLIER, PRICE (1860-1913). American writer, was born at Davenport, Iowa, May 25 1860. He lived, while a boy, in Switzerland and England. After studying at Leipzig and at the Harvard Divinity School (B.D. 1882) he became a Unitarian clergyman, but retired from the ministry in 1891. He is best known for his clever sketches of national character in America and the Americans from the French Point of View (1896); England and the English from an American Point of View (1900); The West in the East from an American Point of View (1914) and Germany and the Germans from an American Point of View (1913). He died on the island of Fünen, in the Baltic Sea, Nov. 3 1913.

COLLINGS, JESSE (1831-1920). British politician, was born at Littleham, Exmouth, Devon., Jan. 9 1831. He was partly educated at home, and also at Church House school, Stoke, near Plymouth. In 1866 he settled in Birmingham, where he founded the mercantile firm of Collings & Wallis, and had a highly successful business career. Entering municipal life, he was intimately associated with Joseph Chamberlain, whose devoted henchman he became. In 1878 he was elected mayor of Birmingham, and in 1879 retired from business. In 1890 he was elected as Liberal M.P. for Birmingham, and in 1895 as Lord Mayor. He was an advocate of the Radical land policy, known as "three acres and a cow." In Dec. 1883 Lord Salisbury's Government was defeated on an amendment to the Address concerning this policy, moved by M. Collings. In 1886 he entered the Liberal Parliament as parliamentary secretary to the Local Government Board, but resigned with Chamberlain over Gladstone's Home Rule policy. The same year he successfully contested the Bordesley division of Birmingham as a Liberal-Unionist. In 1895, on the appointment of Chamberlain to the position of Colonial Secretary in the Unionist Government, Collings became under-secretary to the Home Office, retaining the post until 1902. He resigned his seat in Parliament in 1918. He was always interested in agricultural affairs, and was the founder (1872) of the Rural Labourers' League and also of the Exminster industrial school. In 1896 he published Land Reform, in 1914 The Colonisation of Rural Britain, and his Autobiography, written in conjunction with Sir J. L. Green, appeared in 1920. He died at Edgbaston, Birmingham, Nov. 20 1920.

COLLINS OF KENSINGTON, RICHARD HENRY COLLINS, BARON (1827-1911). English jurist and lord of appeal, was born in Dublin Jan. 1 1827, and educated at Trinity College, Dublin, and Downing College, Cambridge. He was called to the English bar in 1857 and joined the northern circuit. He edited the 7th and 8th editions of Smith's Leading Cases, was made a Q.C. in 1883 and a judge in 1891. In 1897 he became a judge of appeal and a privy counsellor, in 1901 Master of the Rolls, and in 1907 a lord of appeal (resigning in 1916). In 1859 he represented Great Britain on the tribunal appointed to arbitrate in the boundary dispute between British Guiana and Venezuela; and in 1904 he was chairman of the commission which investigated the case of Adolf Beck (see 14.387) and resulted in his conviction being annulled. Lord Collins died at Hove Jan. 3 1911.

COLLIER, ROBERT (1823-1912). American divine (see 6.664), died in New York City Nov. 30 1912.

COLOMBIA (see 6.700).—According to the census of 1912, the South American republic of Colombia (excluding Panama) had a pop. of 5,072,601, living in 14 departments, two territories (intentencias) and seven special districts (comisarías). Significant modifications of the constitution of 1886 were made by the Congress of Colombia in 1910. A law enacted on June 6 1910 provided that, in case of a vacancy in the presidency, two persons selected by Congress were temporarily to exercise the powers of the president in a designated order. If Congress did not select any substitute, then the members of the president's cabinet were to assume the powers of the president in an order to be designated by law.

Education.—Primary education was free but not compulsory for children between the ages of 7 and 14. It was in charge of and supported by the departments except in Bogotá where it was managed by the municipal government. The census of 1910 indicated that 67% of the population was literate. In 1916, according to figures of the Minister of Public Instruction, there were 1,030,000 children between 7 and 18 in attendance at primary schools, both public and private, where secondary and professional training was given to both sexes. The total of primary, secondary and professional educational institutions, public and clerical, for both sexes in Colombia in 1916 reached 23,892, and the total attendance 381,896. The chief
institution of higher education was the National University at the capital, which in 1920 was composed of four colleges, one of philosophy and letters (Colegio del Rosario), one of medicine and natural science (Facultad de Medicina), one of humanities and civil engineering, and one of law and political science.

Finance.—In 1911 and 1913 Colombia contracted new foreign loans aggregating some £ 800,000 and bearing interest at 6%. The budget for 1920 estimated the total revenue at 24,000,000 pesos de oro; and the expenditures at 27,792,581.37 pesos de oro. In his message to Congress, July 20 1920, President Fidel Suárez estimated that the revenue for the current year might reach 24,000,000 pesos de oro. At that time the external debt of Colombia amounted to 8,508,000 pesos de oro, besides a debt of 11,355,065 pesos de oro which had been incurred to promote the construction of railroads. On the stipulation that the Government was paying this debt regularly through a London firm. The internal debt of Colombia was composed of the consolidated debt and the floating debt, amounting respectively to 2,858,359 pesos de oro and 10,480,654 pesos de oro. The total debt in July 1920 amounted to 38,040,073 pesos de oro, excluding some 4,000,000 pesos de oro of current obligations.

Monetary System.—By a law of 1909 the regulation of Colombia's currency was entrusted to a board which was directed to gather a gold reserve and to guarantee the redemption of the paper money and to give new bills and coins in exchange for old paper. The ratio of the gold peso to the pound sterling was fixed at 5 to 1. In 1915 an official estimate of the money in Colombia in U.S. currency was as follows:

<table>

Early in 1916 the Government issued an order that paper currency should be exchanged at the rate of 100 paper pesos (moneda papel) for one peso de oro in coin or new banknotes. The monetary unit of Colombia was in 1920 the gold peso de oro.

On Feb. 10, 1909, Gen. Raimon Gonzalez-Valencia was elected by Congress to serve as president for one year in place of Gen. Reyes, who had resigned. On July 15 1910, Carlos E. Restrepo, a journalist and publicist, was elected president. President Restrepo aimed to restore the credit of the country, to rehabilitate the finances, and to make a satisfactory adjustment of the Panama affairs. At the end of his term he refused to become a candidate for re-election. In the presidential election of Feb. 1914, a Conservative, José Vicente Concha, was elected president for four years. The Liberal candidate had withdrawn from the contest before the election was held, and the result was considered a triumph for Colom. President Concha was inaugurated on Aug. 7, 1914, and the Liberals minority representation in his cabinet. His Minister of Foreign Affairs was the litreateur and statesman, Marco Fidel Suárez, and his Minister of the Treasury was the liberal leader, Diego Mendoza. Before the end of Concha's administration, however, the last-named minister resigned from the cabinet. Aside from fiscal and diplomatic problems which he inherited, President Concha had to face new problems resulting from the war. In Oct. 1917 the Minister of Foreign Relations, whom the Conservatives had nominated for the presidency, resigned from Concha's cabinet. Marco Fidel Suárez was elected president of Colombia in Feb. 1920, and was inaugurated on Aug. 7 for the term 1918–22. Colombia's relations with Panama and the United States had long remained delicate because of unsettled questions arising out of the setting up of Panama as a separate State in 1903. After Gen. Reyes' visit to Washington failed, an attempt was made in 1909 to adjust those questions by a treaty negotiated by Colombia's envoy, Enrique Cortés, and Secretary of State Elihu Root. In connexion with the projected treaties between Colombia and Panama and between Panama and the United States, this treaty stipulated that Colombia should acknowledge Panama's independence; that Colombia should renounce all claims against Panama and the United States and be free from all debts incurred by Colombia before Nov. 3 1903; and that Panama should pay Colombia annually $25,000 (U.S. currency) for 10 years. As this agreement was unacceptable to Colombia, on April 6 1914 Thaddeus A. Thompson, minister of the United States in Bogotá, and José F. Urrutia, Minister of Foreign Relations for Colombia, signed a treaty containing expressions of regret by the United States for the difference that had arisen between herself and Colombia because of Panama, granting Colombia special privileges in the use of the Panama Canal, and providing that the United States should pay Colombia $25,000,000 to recompense her for the damages due to Panama's independence. This treaty was ratified by a law of the Colombian Congress on June 9 1914. The apologetic phrases, in particular, occasioned delay in the United States: with modifications, in April 1921 it was ratified by the U.S. Senate.

After the outbreak of the war, Minister Fidel Suárez addressed a circular to the editors of Colombia, on Nov. 27 1914, exhorting them to observe a strict neutrality. In response to a communication of Germany's minister at Bogotá, announcing the renewal of the unrestricted submarine campaign, Fidel Suárez expressed a desire for an end of the war and deplored its effects. When he mentioned the use by belligerents of measures which rendered it difficult to save neutral property and innocent lives he declared that his Government reserved the right to protest and to demand justice. On June 3 1917 he sent a circular to the governors of the interior, deprecating the intention of his Government to observe neutrality in the war between the United States and Germany. In making this announcement he took occasion to deprecate certain attempts that had been made to show that Colombia "sympathized incorrectly with one or another of the belligerents." As one of the countries invited to accede to the League of Nations, the Government, in accordance with the authorization of Congress dated Nov. 3 1919, accepted and joined the League. In filing her admission, however, Colombia served notice that her acceptance of Article X of the Covenant did not imply her acknowledgment of Panama as an independent nation. Two delegates from Colombia attended the assembly of the League at Geneva which adjourned in Dec. 1920.

COLORADO (see 6,717).—The pop. of the state in 1920 was 936,629; in 1910, 760,024—an increase of 140,605, or 17.6% as compared with 48% in the preceding decade. Native-born were 83.8% in 1910, whites 98.3%, negroes and Indians numbered 12,935, and there were 3,736 Chinese and 2,500 Japanese. The density of pop. increased from 7.7 persons to the sq. m. in 1910 to 9.1 in 1920. The decay of mining towns altered the balance between urban and rural pop.; in 1920 the urban pop. was 48.7%, or a decrease of 22.8%; the rural pop. was 51.3%, or an increase of 7.1%. The pop. of 1920 of the six cities then having a pop. of over 10,000, their pop. for 1910 and the percentage of increase, were:—

Leadville decreased in pop. from 12,455 in 1910 to 7,508 in 1910 and to 4,490 in 1920.

Agriculture.—During the decade 1910–20 agriculture displaced mining as Colorado's most important industry. The number of farms increased 29.8%, to 90,934; their area 80.8%, to 24,462,610 ac.; and their average size 30.2% to 408 acres. The value of all farm property increased 119.1% to $8,076,797,479. The number
were estimated at $763,722,716; buildings at $102,300,141; implements and machinery at $49,804,509; and live stock at $160,097,580. The farm crops in 1919 were:

The irrigated area was 2,792,032 acres in 1900, 3,348,165 ac. in 1910, while acreage under all irrigation enterprises, whether completed or not, increased from 9,277 to 23,341 in 1917. Organized drainage enterprises, most of them having been rendered necessary by faulty irrigation, had affected 171,659 ac. at a cost of $1,081,975. In 1920 there were in the state 206,754 horses, 31,125 mules, 3,999 asses and burros, 1,433,473 beef cattle, 122,123 dairy cattle, 1,813,255 sheep, 28,688 goats, and 449,866 swine. In the same year the number of poultry was 2,994,347, and there were 63,250 hives of bees.

Mining.—Colorado’s rank among the states in the production of the principal metals in 1918 was as follows:—Radium, with an output of $7,500,000; tungsten, first, with an output of $1,633,668; antimony, with an output of $1,250,000; lead, second, with an output of $4,282,821 lb.; zinc, fifth, with an output of 88,141,748 lb.; silver, fifth, with an output of 7,671,768 oz.; copper, tenth, with an output of 6,423,919 pounds. Production of coal reached a total of 10,811,481 tons in 1917. Petroleum production in 1917 fell off to 204,000 barrels. There has been great interest in the deposits of oil shale in the Green river formation in the western parts of the state, for processes for utilization on a commercial scale have not yet been put in operation.

Manufactures.—From 1900 to 1920 the number of manufacturing establishments in Colorado nearly doubled, the number of persons engaged more than doubled, and the capital invested increased 225%. In 1919 there were 2,561 manufacturing establishments, employing 44,741 persons, using capital to the amount of $243,827,000, and the value of the products was $275,622,000. Higher prices rather than expansion of production caused the increased figures. A state rank thirty-second in value of manufactured products, which represented only 0.6% of the value for the United States. Beet-sugar manufacture became the leading factory industry in 1914. There were 14 operating plants in 1914, which manufactured beet sugar valued at more than $31,000,000. Slaughter-meat and packing plants amounted to more than $41,000,000. Flour and girtmill plants numbered 2,600 in 1915, with a value of $7,585,633; a moderate increase in output in 1919 was accompanied by high prices, giving that year an unusual value of $29,000,000. Butter, cheese, and condensed-milk industries became important, their products being exported to the extent of $1,020,000 in 1919.

Education.—In 1919 the illiterates, 10 years of age or over, were 3.7% of the pop. of the state, although the foreign-born whites of those ages were 11.3%. There were 1,885 school districts in the state, with 12,121 school buildings and employing 13,621 teachers. The school pop. for the year ending June 30 1918 was 257,884, and the enrolment in public schools 191,199. Public school expenditures for 1915 were $9,802,690. The total amount invested in school property was $15,212,000, an average of $79.08 per pupil enrolled. The state’s permanent school fund, derived from Federal land grants, amounted to $4,948,402 in 1918. The income of the permanent school fund (about $600,000) is apportioned among the school districts, giving about $23.5 per capita of the school population. Sales and leases of school lands, and royalties on minerals, have increased the state school funds, and the unsold lands, together with coal and other mineral reserves, are estimated at $125,000,000. County and district tax levies, the main source of school revenues, produced $1,572,155 in 1918. There was a program for the consolidation of rural school districts, with joint support of central schools in which two or more counties are interested. The Legislature of 1921 passed a law providing a minimum salary for teachers graded for the several classes of districts. Separate districts in the state (totalling 3 in Denver, Colorado Springs, and Sterling) in 1920 adopted salary schedules which fixed higher standards for teachers with advanced professional training. Public high schools and institutions of higher education developed from 1900 to 1918. In 1900 there were 20 higher institutions in Colorado, of whom 12 were coeducational. In 1918, 21,271 students taxed the capacity of secondary schools and colleges, requiring increased taxation for current expenditures and bond issues for buildings. The enrolment in the secondary schools in 1920 was 21,420, or 1919.

Finances.—The total bonded indebtedness of the state Nov. 20 was $4,187,300. The general assessment valuation of taxable property was $1,498,651,120 in 1919, $1,459,397,996, on which there was a state levy of 3.47 mills, producing $5,260,000 in 1910 and $5,211,836 in 1919.

History.—A special session of the Legislature in 1910 submitted to the voters a constitutional amendment adopting initiatory and referendum, which was ratified in Nov. of that year. The same special session adopted a primary election law, providing for direct nominations by the people of candidates for the U.S. Senate, Representatives in Congress, and all elective state, district, county, ward and precinct officials, as well as members of the state Legislature. This Act provided for party assemblies, at which party candidates might be designated to seek nominations in the primaries, every candidate receiving 16% or more of the votes of the delegates to the assembly being certified by the assembly as a candidate to enter the primaries. It was also provided that persons not entering the assembly might become candidates for any of the offices above mentioned by petition, the number of signers required being 300 for any official who is to serve any political district in the state greater than a county and 100 for other officials. The expense of candidates in such primaries was limited by the Act and severe penalties were provided for violations. In 1911 an Act was passed providing for registration of voters for all elections to be held in the state except school elections, and providing severe penalties for false registration and other violations of that Act. In Nov. 1912 the people approved amendments to the state constitution providing for recall of elective officials and, in certain cases, for the recall of judicial decisions. An Act proposed by initiative was passed at the same time, providing for a ballot without party headings.

The voters adopted in Nov. 1914 an amendment to the state constitution prohibiting the sale and manufacture of intoxicating liquor, which became effective Jan. 1 1916. The Legislature at its regular session in 1917 petitioned Congress to adopt an amendment to the Federal Constitution to prohibit the manufacture and sale of intoxicating liquors in the United States, and the prohibition amendment to the Federal Constitution was ratified by the Colorado Legislature in regular session Jan. 15 1919.

The Legislature in 1919 passed an Act providing for a budget system in making appropriations and creating a state budget and efficiency commissioner. The first budget prepared under this Act was presented to the Legislature in 1921. The Legislature in 1921 passed amendments to the constitution, for submission to the voters, proposing the extension of the tenure of state and county officers from two to four years. A proposal was submitted to the voters for a convention to revise the state constitution, this proposal being simultaneous with the federal series of Acts urged by the governor for the reform and consolidation of executive offices and boards. Persistent advocacy by the governor secured the passage of laws for reestablishment and encouragement of a national guard, for a department of safety with a force of rangers as a state police force, and for a substantial appropriation to be available to suppress riots.

There were a number of serious labour disturbances between 1910 and 1920, some of them marked by violence and virtual insurrection which had to be put down by the military forces. A notable contribution to better relations between capital and labor was the inauguration of the superintendent plan of the state. John D. Rockfield, Jr., the president of the Colorado Fuel and Iron Co. in 1916. Employees, by districts and classified groups, elect representatives who have the right to confer with executives on all questions affecting wages, conditions of employment and operation, and general welfare. The success of the system in Colorado has had marked influence on similar large industrial organizations elsewhere.

In 1910 the state administration was in the hands of the Democratic party, with Joseph H. Shafroth as governor. The Democrats again elected a governor in 1912, Elias M. Ammons, a result largely due to the split in the Republican party throughout the nation. In 1914 George A. Carlson, Republican, was chosen governor. He was succeeded by Julius C. Gunter, Democrat, elected in 1916 when the leadership of President Wilson on international issues made his party dominant in the states, largely through women’s votes. A reunited Republican party, profiting by popular reaction on war issues, elected Oliver H. Shoup as
The use of colour in animal coloration can at present only be very imperfectly understood because little is known of the colour vision of animals. There is some evidence that animals have a colour perception less sensitive than man: if such prove to be the case, then a ready explanation for several dimorphisms is available. For instance, among insects it is common to find that whilst some individuals of a species are green, others are brown; but towards a colour perception slightly less sensitive than man's, these colours will be indistinguishable, and thus against either green or brown backgrounds neither the brown nor green individual would have the advantage. A common defect in man's colour sense is an inability to distinguish red from green; it is possible that such a colour as the red of the robin's breast against green foliage may serve to conceal the bird from its enemies.

When bright colours are used for concealment, as shown by the animal's habits, and by the particular pattern and position which the colour occupies, then advantage appears to be taken of the fact that red is a very conspicuous colour at high illuminations and blue at low illuminations. The brilliant inhabitants of the forest present a preponderance of blue, whereas red is more often found among those living in the open. This also applies to flowers, the bluebell typifying the colour for woods and the poppy for the open.

Experiments have shown that it is possible to determine, in many cases, whether a given pattern is for concealment or revelation: for instance, it has already been mentioned that concealment may be effected by a pattern which breaks out along the animal's margin and thus tends to conceal its characteristic shape. Conversely, patterns which follow an animal's margin and tend to accentuate its characteristic shape and separate it from its surroundings, make for concealment. A pattern of this kind, commonly seen in butterflies, is a broad black band following the outer margins of both wings and often losing a brilliant yellow or bluish central area. Experimental evidence of this kind, as well as that derived from a study of an animal's habits, is strongly against the view that all coloration is for concealment.

The concealment of cast shadow is commonly brought about by the crouching or squatting of either hunted or hunter. Among butterflies Marshall has pointed out two methods of avoiding cast shadow: Certain species when resting on the ground with closed wings will tilt over the wings, generally away from, sometimes towards the sun, thus reducing and hiding the shadow cast upon the ground. Other species will settle on the ground with wings folded and often resting a brilliant yellow or bluish central area. Experimental evidence of this kind, as well as that derived from a study of an animal's habits, is strongly against the view that all coloration is for concealment.

Another use of pattern is to give a blurred or indistinct appearance to an outline. It is common to find, along the margin of the wings of butterflies and moths, a very small black and white, or contrasted, pattern which is visible at short distance; at longer range the pattern blends and then the margin has an indistinct appearance, causing the insect to fade into its background. The finely spotted, barred and striped patterns of many many many many many many many many many many many many many many many many many many many many many many many many many many many many many many COLOUR-VISION and COLOUR-BLINDNESS

refuge. Many grasshoppers and moths look red and blue when flying, but on settling, these bright colours are at once hidden.

Swinneyton has suggested the substitution of "distinctive coloration" for "warning coloration"; the assumption is that a prey will remove the distinctive colours of vultures, and associate them with their varying palatability. In support of this there is much evidence to show that many animals have a good memory in this respect.

Mimicry.—In view of the fact that insects can be graded in respect of their palatability, the distinction between Mullerian and Batesian mimicry appears difficult to maintain. A set of animals presenting common warning coloration (Mullerian mimicry) are never equally palatable, and therefore it may be said that the relatively palatable of this set are of the nature of Batesian mimics. Although in extreme cases a distinction may be drawn, in many cases the two form a series, and it is impossible to classify in this way. In the study of mimicry many notable advances have been made, chiefly among butterflies. Several insects which were thought to be different species, or varieties, have lately been shown by breeding-experiments to be polymorphic forms: the same species mimicking sometimes one species and sometimes another, both forms being bred from the same mother. Also it has been shown that, in situations where models are scarce, the mimicking species presents transitions between its various polymorphic forms, and this fact is considered to indicate that natural selection is required to maintain a mimicry. At one time it was thought that butterflies had few enemies, and that therefore their remarkable mimicry could bear no relation to natural selection; however, evidence that they are eaten by birds to a considerable extent has been brought forward by several observers.

Sexual Coloration.—Secondary sexual coloration still gives rise to much speculation. The Darwinian view that it represents selection by the female is still held by some observers. Others consider that it serves the purpose of stimulating the sexual instinct of the female; or that it is related to the different habits of the male and female, as, for instance, the incubation of eggs; or that it represents a difference in value to the species between male and female, making the conspicuous but less valuable male more likely to be destroyed by enemies than the inconspicuous and valuable female. These various theories are mentioned to show that no general law to explain these colorations has been accepted. Much valuable field work has been done in which many new facts as regards sexual displays have been collected.

Chemistry of Animal Colours.—It has been shown that, in the case of the lobster and salmon, the colours which the males assume at the breeding-season are due to the laying down of a coloured waste product in the scales and shell. This waste product is finally got rid of when the scales become worn and the shell becomes hard. In the case of the male, the waste product is discharged in quite a different manner; it is deposited in the eggs and disposed of when they are laid. In certain parts of England and Germany, chiefly in the neighbourhood of large towns, many species of moths have developed melanotic forms, or these dark forms have greatly increased in number. Much work has been done in an endeavour to discover the cause of this change, as it was at one time thought to be a case of the acquirement of a dark coloration for concealment against sooty surroundings, and thus to be an example of the rapid action of natural selection. Melanism, however, occurs in other districts, distant from large towns, more particularly near the sea. Recently evidence has been brought forward that this change is due to the particular feeding of the caterpillar; that, in fact, a deposit occurs on the leaves near large towns and near the sea, which causes this change.

Physics of Animal Coloration.—Several eminent physiologists have taken an interest in, and attempted to explain on a physical basis, the brilliant metallic and iridescent colours of many insects and birds. Although a physical explanation of the coloration of most objects is available the brilliant colours of these animals remain a mystery. A recent summary by the late Lord Rayleigh in the Philosophical Transactions may be quoted:—"These colours are probably structural rather than pigment, but still much remains to be effected towards a complete demonstration of the origin of these effects. Even if we admit an interference character questions arise as to the particular manner and there are perhaps possibilities not hitherto contemplated."

It has been suggested that fluorescence plays a part, and to test these insects have recently been examined in a beam of ultra-violet light. It was found that the brilliantly coloured species are not fluorescent. A few Lepidoptera were found to be fluorescent and this character has been found to be of some service in classification, as the property appears to be limited to closely allied species when it occurs in a group.

COLOUR-VISION AND COLOUR-BLINDNESS (see 28.139.)—Much new work has been done in research on these questions, which have become increasingly important in practical life; and a restatement is needed (1921) of the accepted views.

The Physical Basis of Normal Colour-Vision.—White light can by means of a prism be split up into its constituent parts to form a spectrum which shows a number of colours. The spectrum or rainbow consists of a series of waves of light of different length, but all of these waves of light are able to stimulate one type of the retina, to which the waves are a mixture of red, yellow, green, blue and violet. A few will state that there are seven colours, indivisible as a colour, being seen in the region of blue-violet. Newton appears to have seen the spectrum in this way.

The spectrum may be examined in another way, certain portions of it being isolated between two shutters. An extraordinary fact then becomes apparent, viz. that large divisions of the spectrum appear to be monochromatic; that is to say, they have a painted-on effect. One brush of colour, though physically every part of the division differs. Most normal-sighted persons divide the spectrum into about 18 monochromatic divisions: those with superior colour-perception into ten divisions, and those with inferior perception a less number. For instance, those who see three colours in the spectrum generally divide it into ten monochromatic divisions. These divisions are examined by a special test and it is found that each is wrong and to contain several colours instead of one. It is obvious that a man who sees only ten colours instead of 18 will confuse colours which appear different to the normal-sighted.

The Anatomical Basis of Vision and Colour-Vision.—It is upon the outer layer of the retina, the membrane lining the back of the eye, that the images of external objects are formed. The outer layer of the retina is the layer farthest away from the front of the eye, so that light has to pass through all the other layers before it reaches the sensitive portion. This sensitive layer consists of two elements, which are called respectively, on account of their shape, the rods and the cones. A little research shows that the cones is the region of most distinct vision. In the fovea only cones are present. External to the fovea the rods are arranged in rings round the cones, and the proportion of rods to cones increases as portions of the retina farther removed from the fovea. A further region is the region of the peripheral retina, where, again, only cones are found. In the outer segment of each rod there is a rose-coloured substance, the visual purple, which is photochemically sensitive to light. This visual purple is found in the cone as well as in the rod; it may be that it was not considered to be essential to vision, because it was absent from the cones, and only is the cones to be found in the fovea. The retina is the region of most interest for the vision. Though the visual purple is not present in the cones of the fovea, it is found between them, four special canals aiding the flow from the periphery to the centre of the fovea. When there is no visual purple in the fovea it is blind.

The visual purple is confined to a thin layer of fluid, which is kept in its place by a membrane.

The visual purple is diffused into this liquid and on being decomposed by light stimulates the cones, thereby setting up a nerve
impulse, which causes the sensation of vision. The movements of, after-images show that the stimulus in vision is fluid and situated outside the cones. The rods are not perceptive elements but regulate the formation and distribution of the image. The development of the visual purple by light stimulates the ends of the cones, and a visual impulse is set up which is conveyed through the optic nerve fibres to the brain. The character of the impulse is transmitted and becomes the sensation of vision.

Therefore in the impulse itself we have the physiological basis of the sensation of light, and in the quality of the impulse the physiological basis of the sensation of colour. The impulse being conveyed along the nerve to the brain stimulates the visual centre, causing a sensation of light, and then, passing on to the colour-perceiving centre, causes a sensation of colour. But though impulses vary in character according to the waves of light, the visual nerve does not discriminate between adjacent impulses, the nerve cells not being sufficiently developed.

Even with the normal-sighted there is room for much further development in the discrimination of colour, but when the development is not up to the normal standard or there is a defect in any portion of the apparatus diminishing the power of discrimination, colour-blindness is the result.

**Evolution of the Color Sense.**—There can be no doubt that an evolution of the colour sense has taken place. The only point is, how, and when, did this occur? It is obvious that in those low forms of animal life in which the visual faculty is considered to be the wave-length and its amplitude; the greater the amplitude within certain limits the greater the intensity of the sensation.

The wave-length of the physical stimulus is the physical basis of the sensation of light; and the amplitude of the visual sense is that of the visual being and the intermediate portions will still further differentiated, and so we arrive at those who can see six and seven colours in the spectrum respectively.

It is not necessary to consider the further evolution of the colour-sense by which the retina came to be capable of discriminating among those seven definite colours in the spectrum.

**Colour-Blindness.**—Colour-blindness is not really a good term for the defect so named. Though in certain varieties there is actual blindness to colour, in the ordinary varieties colours are clearly seen and seen as colours, but there is a lack of power to differentiate between them; for instance, reds are confused with greens and greens with reds. A colour-blind man picked up a red-hot coal, remarking as he did so, "What funny green thing is this?" The case which first drew general attention to the subject of colour-blindness was that of Dalton, the famous chemist. After Dalton had received the scarlet gown of a doctor of medicine from Oxford, he noticed that the robes were actually violet, and the unconsciousness of the effect it produced in the street. When he was asked what the bright scarlet gown which he wore resembled, he pointed to some evergreens outside the window and the colours were exactly similar to him. The lining of the gown, which was pink, he stated appeared to him sky-blue.

A soldier in the days when they wore scarlet coats took off his coat and put it on a hedge, and was quite unable to find it when he wished to put it on again, though it was the most conspicuous object in the landscape to other people. Many colour-blind golfers find great difficulty in recognizing the red flags on the course at a distance.

Those who are colour-blind often first discover their defect as children by finding great difficulty in picking cherries or strawberries, because of the similarity in colour to their leaves. A colour-blind man has bought a bright green tie under the impression that he was purchasing a brown one; an artist has painted the face of a portrait green and trees red. A colour-blind man has written half of a letter in black ink and half in red ink, under the impression that the whole was written in black ink. At first sight it would seem a very easy thing to detect persons who make such errors. Though this is true in certain cases it is not so in others. In many cases they have been submitted to experts who have failed to detect them after an hour's examination.

A musician's wife informed the writer that she had tested her husband again and again and was quite certain that he was not colour-blind, and that he was able to see colours as well as she could; she was only convinced when she found that he was quite unable to read any of the letters on the card test.

Cases of colour-blindness may be divided into three classes, which are quite separate and distinct from each other though one or more may be present in the same person. In the first class there is light as well as colour loss. In the second class the spectrum of light is intact but either or both of the senses are defective in some way as is the case in third class, the red and blue are combined into an apparent black. That this is a defect in the perception of colour. In the first class certain rays are either not perceived at all or very imperfectly. Both these cases are represented by analogous conditions in the
COLOUR-VISION AND COLOUR-BLINDNESS

perception of sounds. The first class of the colour-blind is represented by those who are unable to hear very high or very low notes. The second class is represented by those who possess what is commonly called a defective musical ear. Colour-blind individuals belonging to this class can be arranged in a series.

At one end of this series are the normal-sighted, and at the other end the totally colour-blind. In the third class of the colour-blind there is a defective perception in the central or central region of the retina not being normal.

Abnormalities and defects of light-perception may be subdivided as follows:

1. Increase or diminution in the visible range of the spectrum.
2. Discrepancy of sensitivity for certain wave-lengths.
3. Increased sensitiveness for certain wave-lengths.
4. Variations in the maximum of the luminosity curve.
5. Increase or defects in the power of dark adaptation—(a) Very rapid recovery or slow adaptation; (b) very complete or imperfect dark adaptation.

If a number of persons be examined with a bright spectrum as to the point when they first see light where the red commences and the point where violet terminates, it will be found that there are considerable variations in different cases.

A very common mistake due to shortening of the red end of the spectrum is to call it yellow. If a person with inconsistent shortening of the red end of the spectrum is shown a pink which is made up of a mixture of red and violet, the red consisting of rays occupying the missing portion of the spectrum, only the violet is visible to the person to whom the pink appears to be entirely red. This pink is therefore matched with a violet or blue very much darker than itself.

An examination of those belonging to the second class of the colour-blind will show that those who are only slightly defective will declare that there are only five colours in the spectrum, orange not being seen as a definite colour, but as a yellowish-red. Another set of people will state that there are only four definite colours, red, yellow, green, and violet. Those who are still more defective will state that there are only three colours in the spectrum, red, green, and violet. These describe the spectrum as red, green, and violet and violet. Then there are those who state that there are only two colours in the spectrum, red and violet, with a neutral point in the green. This neutral division between the red and violet may in extreme cases be so large that only yellow and violet are seen, and, in extreme cases, with a large grey region between. Finally there are persons who see no colour in the spectrum, but see it as a colourless band varying in luminosity in its different parts. It will be seen therefore that we can classify the degrees of colour-perception according to the number of definite colours which are seen in the spectrum. Those who see seven colours may be called heptachromic, those who see six, hexachromic, those who see five, pentachromic, those who see four, dichromics, and finally the totally colour-blind.

It might at first be thought that this classification was artificial and arbitrary, because in some cases saw exactly alike, but further examination will show that this is not the case. Those who see six colours in the spectrum know that there are several varieties of green, but all these are associated by their green character, and are plainly compound, it being impossible for them to be otherwise. Hence it is quite obvious that the colour is a mixture of yellow and green, and hence the term yellow-green correctly describes it. The trichromatic designation yellow as red-green and this does not correctly describe yellow for the normal-sighted.

The Tests for Colour-Blindness.—On account of the arrangement of signals by sea and land it is necessary that persons employed in the marine and railway services should be able to recognize and distinguish between the standard red, green, and white lights, in the requisite conditions.

It is not only necessary to find out whether a man is able to distinguish between the red, green, and white lights, but to ascertain as well that he thoroughly understands what is meant by a particular individual characteristic of red, green and white respectively. Too little attention has been paid to this in constructing tests for colour-blindness, and those who have had much practical experience in testing for this defect, are aware of the ignorance which exists among uneducated persons with regard to colours. Many are under the impression that every shade of a colour is a fresh colour, and others have the most novel ideas with respect to colours. It is necessary that a sailor or engine-driver should be able to recognize a red, green, or white light by its character of redness, greeness, or whiteness respectively; that he has definite ideas of colour and is able to reason with respect to them. All persons who are not able, through physical...
COLUMBIA UNIVERSITY—COMMERCE

be a better term. The three-sensation theory is only one explanation of the fact that when a green spectral ray is seen by eye, they make yellow. The explanation that when red and green are mixed the resulting impulses cannot be distinguished by the nerve cells does not hold, for simple yellow is sufficient. This explanation is supported by the fact that in the dark adaptation see green, red, and yellow. There is no evidence that the assumptions of the three-sensation theory are true. Simple yellow cannot be split up into its yellow and red components in the retina, for the retina's dark adaptation does not alter the hue of spectral yellow. As blue is not be made up chiefly of the green and violet sensations, and yellow to be made up chiefly of red and green sensations, the green channel should be sufficiently yellow to be made up of the yellow with which it is split up, and yellow should appear red. This is not the case. The eye may also be fatigued with spectral yellow, so that all yellow disappears from the spectrum without affecting the appearance of a very feeble red. When this happens it is evident that the number of colored sensations that can be reduced in the same proportion all the colours do not disappear at the same moment. If, therefore, spectral yellow were a compound sensation it should change colour on being reduced in intensity. If, however, spectral yellow be isolated in the spectrometer, and the intensity be gradually reduced by moving the source of light away, the yellow becomes whiter and whiter until it becomes colourless, but does not change in hue.

In cases where a subjective red is seen with an illumination by white light, this red is seen with a compound yellow but not with a single spectral yellow.

When the three sensations applied to colour-blindness is it still more unsatisfactory and is quite unable to explain the fundamental facts, as for instance why the colour-blind should make an increased monochromatic vision seen by even certain colour-blind persons should be able to pass the wool test. Without an explanation of the fact that simultaneous contrast is increased in the colour-blind. One of the best-known cases of colour-blindness, a simple example of the way in which a red-blind sensation can be reduced by a yellow sensation is the case of a red-blindness and by another as a case of complete green-blindness.

The present writer has never examined a single case of colour-blindness which, on a detailed examination with spectral colours, could be explained on the hypothesis that there is only one theory. For instance, a case of shortening of the red end of the spectrum may be taken in which the red is shortened to 5680; at 5670 the perception of red may be increased by 100 per cent. An eye's normal perception of another, the red and the shortened portion should according to this hypothesis be brought up to the normal by doubling the amount of red. Further, the shortened portion will be found to be black when there is complete shortening that any amount of red light from the shortened portion may be added without being perceived. In another way it can be conclusively shown that the shortening is not produced by the diminution of a hypothetical tuning-fork, which is 6800, 8000 and 9000 from every part of the spectrum. A man with shortening of the red end of the spectrum will match as identical pink and blue wools, the pink wool appearing much lighter to the normal-sighted than the blue one. If the red wool is seen through blue-green glass which is opaque to the rays occupying the shortened portion, they will appear identical in hue and shade. It should be noted that whilst the blue-green glass cuts off the physical red rays it transmits numerous rays supposed to stimulate the red sensation.

When three selected spectral colours, for instance red, green, and violet, are mixed in suitable proportions a white is made which will exactly match the white from which the spectrum was formed. On the three-sensation theory the two are psychologically identical, that is to say, the three hypothetical sensations are stimulated in similar proportions by the mixture as by the white light, though the two are physiologically different. It is the third sensation theory that after fatigue (say) to red or green the match should still remain, and supporters of the theory state that no change is observed in these circumstances. This, however, is not the case, and if a third sensation were present it would be as difficult to fatigue with red light, which is supposed to affect only the hypothetical red sensation, the match is no longer correct, and a very measurable fact becomes apparent, namely, that much more red will be required in the mixed white.

The mixed white appears a bright green to a person whose eyes have been fatigued for red, and in order to make a match the amount of green has to be reduced to about one-half, so that the mixed white appears bright red to a normal-sighted person with unfatigued eyes.

COLUMBIA UNIVERSITY (see 6,730).—The work of Columbia University during the period 1910–20 was greatly extended. A school of journalism was founded in 1912, a school of business in 1915, and a school of dentistry in 1917. In order to render the larger possible service to the community, courses in university extension were organized for men and women who could give only a portion of the time to study and thus extend a definite subjects included in a liberal education. These courses, however, did not lead to degrees, but might be offered as credit toward a degree under one of the faculties. Under university extension there was organized also an institute of arts and sciences which conducted series of lectures and recitals of a popular nature, as well as a system of courses for home study for persons unfit for classes in the university. These courses also did not lead to academic credit or degrees. In 1920 there were in Columbia University in all departments 1,150 instructors and administrative officers, and in the twenty months ending June 30 1920, 28,314 students were enrolled. Of these, roughly one-third were registered in the 1916 summer session; one-third in the degree-granting schools and faculties during the academic year 1919–20; and one-third in university extension during the academic year 1919–20.

The productive endowment of the university, including the endowments of Teachers College, Barnard College, and the College of Libraries, amounts to $7,000,000. The present property occupied for educational purposes, made a total capital investment of $72,000,000. To meet the increased costs of education, the fees in the several schools were raised so that they ranged in 1921 from $200 to $426. The students of the university were given a definite part in the government of the institution by an agreement under which six of the 24 trustees were elected on alumni nomination. In 1919, the university was incorporated for the purpose of changing from the "Trustees of Columbia College in the City of New York," to the University of Columbia College in the City of New York, The university took an active part in the World War. Immediately upon the severance of diplomatic relations with Germany in Feb. 1917, it placed its resources, both physical and intellectual, at the service of the Government. There were established at the university schools for training men for both the army and the navy. Providing quarters, medical service, training in the routine, explosives, gas engines, submarine detection, and the Student Army training corps, which prepared men for the various officers' training camps of both armed services. Students, faculty and alumni to the number of 4,725 enlisted in the army and navy, and 2,175 left their previous occupations and assisted the Government in some one of the civilian branches. Two hundred Columbia men died in the war. (N. M. B.)

COLVIN, SIR SIDNEY (1845–1921). English man of letters (see 6,748), was knighted in 1911, and retired from his position as editor of the British Magazine, the Gentleman's Magazine, in 1912. In 1917 he published an edition of the Letters of R. L. Stevenson and an edition of A. J. and K. EMILE (1835–1921), French statesman (see 6,751). The campaign for the separation of Church and State was the last big political action in his life. While still possessed of great influence over extreme Radicals, M. Combes took but little public part in politics after his resigna-
tion of the premiership in 1905. He joined the Briand Ministry of Oct. 1915 as one of the five Elder Statesmen, but without power. He died May 26 1921.

COMMERCE, DEPARTMENT OF, one of the executive departments of the U.S. Government. It succeeded the earlier De-
partment of Commerce and Labor, by an Act of Congress, approved March 4 1913, which also created a separate and in-
dependent Department of Labor (see LABOR, DEPARTMENT OF). The Secretary of Commerce is a member of the president's Cabinet but is not in line of succession to the presidency. It is his duty to promote the commerce, domestic and foreign, of the United States. There is also an assistant secretary and a so-
licitor, the latter acting as legal adviser to the Secretary and to the heads of the various bureaus of the department.

As originally organized there were 9 bureaus, as follows: (1) the bureau of the census, charged with the collection of data concerning population, agriculture, manufactures, mining, etc.; (2) the bureau of foreign and domestic commerce, for the collection and diffusion of information of use to the manufacturer and exporter; (3) the coast
and geodetic survey, for charting coast waters and surveying rivers to the head of tidewater or ship navigation, and for making deep soundings, magnetic observations, etc.; (5) the lighthouse service, for the light and lifesaving stations and conserving fisheries; (6) the lighthouse service, in charge of the aids to navigation on all U.S. territory, except Panama and the Philippines; (6) the bureau of navigation, having general supervision of the coast and continental marine services, and the enforcement of navigation laws; (7) the steamship inspection service, which inspects steam vessels for the purpose of insuring safety at sea, and issues licenses to masters, managers, and owners of the merchant marine; (8) the bureau of standards, for determining all American measurements; and (9) the bureau of corporations. The last-mentioned bureau, on March 16, 1915, was transferred, to and merged with, the Federal Trade Commission (see FEDERAL TRADE COMMISSION).

Because of the importance of manufactures there had long been agitation among various commercial organizations of the United States for the creation of a government department for promoting commercial interests; but it was not until 1903 that a bill establishing the Department of Commerce and Labor was passed by Congress; it was approved by President Roosevelt Feb. 14, For the next ten years the joint interests of labor and capital were entrusted to this department. The arrangement proved unsatisfactory because of the frequent conflict of these interests, and in 1913 an Independent Department of Labor was created, the name of the Department of Commerce and Labor being changed to Department of Commerce.

COMMUNISM (see 6.791).—The term "communism," is used loosely to cover all forms and theories of social ownership of wealth, but has a more specific current meaning to denote the type of revolutionary socialism first expounded in The Communist Manifesto of Marx and Engels (1847) and to-day held by the various communist parties that exist in most countries and are united in the Communist International. Communism is thus both an old term and an old theory; but the practice of the Bolshevik revolution in Russia (see Bolshevism) and the subsequent propaganda of the Communist International have given it a significance that is in many ways new.

It is important to distinguish at the outset the various senses in which "communism" is often used, in order to avoid the confusions that beset the term. The English writer, Sidney Webb, has distinguished five senses of communism:—(1) the communism of free use, or "all things in common," as exemplified on a limited scale in public roads and bridges, and as aimed at on a general scale in religious or utopian "communities" of all ages; (2) communism by rationing, or the equal distribution of some particular thing or things among the whole population; (3) communism in treatment, or the supply of some particular service, not equally, but according to need, as in the public provision of medical care or education; (4) communism in the sense of socialization or municipalization; (5) the communism of the Communist Manifesto. To these should possibly be added the anarchist communism of Kropotkin and his school, to which the name of "anarchism" was formerly given (see 1.914).

It is only the last of the five senses given above (the communism of The Communist Manifesto) which will be treated here, since the other senses either do not cover a specific political theory or else are coterminous with Socialism in general. It alone has a continuous history and a present significance.

Historical Development. The conditions which gave rise to communism began with the industrial revolution. The social transformation produced by that event, the emergence of a new middle class and its rise to power, and the creation of a growing town population of wage-earners in large industry, led to numerous movements of unrest in the early 19th century and to all kinds of social theories and questionings. At this time the term socialism became applied to various types of theories of a benevolent or cooperative economic order. These theories, however, formulated mainly by individual thinkers in England and France, (4) to and the movement of the masses. The new feature introduced by communism was its direct corollation of social theory with the struggle of the working class. The necessity for this was making itself felt in various quarters; but its first clear expression was given to the world in what is still the classic statement of communism, The Communist Manifesto of Marx and Engels, written in Nov. 1847. The year 1847 thus marks the starting-point of communism as a conscious force.

The Communist Manifesto.—The Communist Manifesto opens with the statement that the history of all hitherto existing human society has been the history of successive class struggles, which have on each occasion either resulted in the revolutionary transformation of society or in its collapse. From the slave systems of ancient civilization to the feudal system of mediaeval society, and from that in turn to the rule of capitalism or the bourgeoisie, there has been on each occasion a new class rising to power out of the旧阶级 (the development of new economic forces and the social revolution from the preceding class. The rise of the bourgeoisie is described in rapid outline, its origin from the bosom of feudal society, its breaking of the bonds of feudalism and monarchy, its revolutionizing of the methods of industry, agriculture and communication, its establishment of modern industry with its accelerated and concentrated production, its extension of the national state and the international trade, and finally its subjugation of the whole world to its mode of production. It has achieved greater miracles than the construction of Egyptian pyramids, Roman aqueducts or Gothic cathedrals; it has carried out great movements than the migration of peoples or the crusades. . . . Although it is scarcely a century since it became the dominating class, the bourgeoisie has created more powerful and more gigantic forces of production than all past generations put together."

Yet to-day the bourgeoisie finds itself threatened in its turn by the new class of the proletariat or wage-earners which its own method of production has created. Like the systems which preceded it, capitalism has created the forces which, in the communist view, will lead to its overthrow: the proletariat, ever growing in numbers and in the insistence of its demands, and an anarchical system of production leading to periodic crises and unemployment, gluts and overproduction in the midst of famine and misery, and a modern communist would add) in its last phase the fierce struggles of imperialism and the havoc of world war. It is contended that these contradictions of capitalism reveal that the forces of production have outstripped the existing conditions of social organization, and that producing goods faster than society can control the use of them under the existing laws of property. Social production has been established, but individual appropriation of the results still remains. The contradiction receives expression in the class struggle of the workers against the capitalists. The proletariat, being without property and living in a régime of increasing social production, can no longer fight for individual ownership, but only for the socially conducted utilization of the means of production belonging to the community and of the goods produced. Thus capitalism has created in the
proletariat a social class which can only have as its object the abolition of the capitalist system of ownership and its replacement by the proletarian system of common ownership.

But there is this new feature in the struggle and future victory of the proletariat, that, whereas all previous class struggles have resulted simply in the rule of a new minority—the rise to power of a new separate stratum of society—the victory of the proletariat carries with it the emancipation of the whole of humanity, because there is no remaining class below them to be freed. The struggle of the working class is thus the struggle of the humanity of the future, and this is the secret of the class basis of all communist thinking.

It is with this struggle that the communists identify themselves, not as a political party, but simply as the champions of the interests of the working class. They believe that just as each succeeding class has won to power only after violent and revolutionary struggle with the preceding class, so the working class can never realize its aims save by the violent overthrow of the capitalist class and its whole system of power. "The communists disdain to reveal their aims and intentions. They declare openly that their ends can only be attained by the forcible overthrow of every obtaining order of society. Let the ruling classes tremble before a communist revolution; the workers have nothing to lose but their chains. They have the world to win."—

The Later Period of Marxism.—In *The Communist Manifesto* may thus be traced all the characteristic conceptions of Marx: the materialist conception of history (not to be confused with either materialism or economic determinism), the doctrine of the class struggle, and the theory of the revolutionary transference of power to the proletariat. At the same time the analysis of the role of capitalism, which was to be worked out later with a wealth of detail in the pages of *Capital* (1867), is already briefly indicated, and in a rapid forward glance the prospect is presented of a transition through the revolutionary rule of the proletariat to a classless society (Note). It may be added that the concreteness and precision to which these original conceptions of the light of the experience of European history and the working-class struggle for the next generation. These writings have particular reference to two dominant events, the revolution of 1848 which led in Paris to the first distinct attempt of the working class to seize power in the "days of June," with the consequent coalition of all the bourgeois forces into a single "Party of Order," and the Commune of Paris in 1871 when for the first time the working class held power for six weeks. The later developments in Marx's historical and other writings are of especial interest for the new light they throw on the practical questions of the communist attitude to the State and the conception of the dictatorship of the proletariat (a phrase which did not take shape till after the writing of *The Communist Manifesto*, its first appearance in Marx's writings coming in 1850).

The modern State has already been described in *The Communist Manifesto* as the "executive committee for administering the affairs of the capitalist class as a whole." The experience of the 19th-century revolutions appears to have convinced Marx that it was idle to expect any fundamental change so long as the apparatus of the existing State was left undisturbed. In the writing of 1848 and of 1851 he stresses the necessity for destroying and shattering the existing machinery of the State. The one and only amendment of substance to *The Communist Manifesto* that he makes in his last preface to it before his death, written in 1872, is to declare that "One thing especially was proved by the commune, namely, that the working class cannot simply lay hold of the ready-made State machinery and wield it for its own purposes." But he demands not merely the destruction of the existing State, but its replacement by a new type of State, a Workers' State or the dictatorship of the proletariat as the transitional organ to carry through the change to communist society:

"Between capitalist society and communist society there lies a period of revolutionary transition from the former to the latter. A stage of political transition corresponds to this period, and the State during this period can be no other than the revolutionary dictatorship of the proletariat." (Critique of the Gotha Programme, 1875.)

This new State will be based on the workers' organizations:—

"Against this new official Government," Marx wrote, in describing the tactics for communists during a revolution in its first stage, "we must set up voluntary workers' councils, either in the form of local committees, communal councils, or workers' clubs or committees, so that the democratic middle class government not only immediately loses its support among the working class, but from the commencement finds itself put out of existence and threatened by a jurisdiction which stands the entire mass of the working class." (Address to the League of Communists, 1856.)

On the other hand the proletarian State is in its nature temporary, because, in proportion as it carries out the task of suppressing class distinctions it destroys its own class basis, and the State as a special organ of class power and coercion gives way to the machinery of a homogeneous communist society. It is only in this second phase of communism that freedom becomes realizable.

*The First and Second Internationals.*—While the main body of communist doctrine was thus receiving its completed form, the first attempts were being made at giving expression to communism in working-class organization. The First International (1864-73) was not a Marxian body; it was a coming together of various types of working-class organization and theory, but from the first Marx played a leading part in it, he drafted its principal declarations, and his ideas became more and more dominant within its ranks, until the controversy with the anarchist Bakunin led to its break-up. The First International was the battle-ground in which Marxism established its supremacy as the social philosophy of the working class. By the time of its demise in 1873 the seed of Marxian socialism had been sown in the working-class movements of Europe.

When the movement towards international working-class organization was resumed with the formation of the Second International in 1889, Marxian socialism was now assumed as the basis of the struggle, and the transference of power to the proletariat were the statutory objects of international working-class organization. But meanwhile, beneath this apparently rapid victory of Marxism, a deep change in conditions had taken place. The movements that came together in the Second International were no longer the scattered sections of a handful of pioneers in working-class organization. They were powerful national organizations of the workers, numbering their adherents in millions. Thus the second stage had been reached of winning the masses to organization; but the work of Marx in the principles of the revolutionary struggle as it has been accepted and used by the Second International, as the war revealed. The peaceful conditions of the period led to hopes of peaceful progress and a gradual transition to socialism without the disastrous necessities of catastrophic change. It was not until the World War, with the collapse that it brought to the ideals of peaceful progress, that communism appeared once more in its full force and with all the revolutionary implications with which Marx had left it.

*The War and Bolshevism.*—The World War, then, is the starting point of modern communism. The war forced to the forefront in an acute form the issues and contradictions that had been latent in the socialist movement. It was no longer possible for the great national movements to maintain their dual allegiance, at once to the existing national State which they hoped some day to control, and to the international class war which they had still continued to proclaim in their resolutions. So there came the division of forces, the division of majority and minority which manifested itself in every belligerent country. The bulk of the official parties supported the war, and in consequence found themselves involved in closer and closer alliance with the Governments. Sections in each country, and in some cases (notably Italy and Russia) the majority, were in opposition.

This division, which began as a difference over the issue of war and peace, soon developed into a deeper opposition. It was not possible for one side to support the war without entering into closer and closer relations with the whole administration of the
COMMUNISM

existing Governments; it was not possible for the other side to oppose the war without implying a denial of the whole conception of the existing national State. As the division developed, its revolutionary implication became more and more manifest; the Zimmerwaldan organization of anti-war socialists, which had been founded as a temporary substitute for the collapsed International at a conference at Zimmerwald in Switzerland in 1915, gradually evolved from an organ of international peace and working-class solidarity into an organ of international revolution and working-class struggle.

It was the Russian revolution that finally brought this new division to a head. The Russian revolution forced into the realm of actual decision the old controversies of class war or class peace, working-class government or democracy. The party which proclaimed its stand on the Marxian principles of class struggle and working-class government was the Russian Social Democratic party (Majority) or Bolsheviks. (From this title of Bolsheviki, meaning "Majority," derived from their holding the majority at the Brussels-London Conference of the Russian Social Democratic party in 1903, has been formed the word "Bolshevism" as a current popular expression for communism and a loose journalistic term for all forms of extremism and violence.) Against their socialist sisters who maintained a coalition with the bourgeoisie, the Bolsheviks carried through the second revolution of Nov. 1917, and established a new form of government based on the Soviets or workers' councils. With this government they proclaimed the inauguration of the dictatorship of the proletariat, and maintained their power against a series of attacks from without and within. From thenceforward they became the natural leaders of the revolutionary working-class movement of the world. As the revolution spread to other countries, the division in the socialist world became more and more complete, and in 1919 the Third or Communist International was founded on the basis of the revolutionary working-class struggle. The old Marxian term communism was thus replaced by the term communism which Marx and Engels had always declared an unsuitable description for a movement which stood for the suppression both of the State and of democracy, and which the communists regarded as having been a cover for the betrayal of the socialist cause. At the Second Congress in 1920 a detailed statement of communist aims, policy and tactics was drawn up; and communism finally came into existence as a fully organized world force.

The Modern Communist Outlook.—The First Manifesto of the new Communist International describes the modern communist outlook. It sees in the ruin of the World War and the peace that succeeded it the fulfilment of the Marxian prediction of the catastrophic destiny of capitalism. Capitalism, it declares, torn by its own contradictions, has plunged into the agony of world war; but war has brought no solution to its problems, just as peace has brought no relief. Hardly has the last war ended before the next war is being prepared; imperialist rivalry continues with more intensity than ever; economic disorganization spreads apace. There is no way out save the complete ending of the system of imperial capitalism that compels these results, and its replacement by the world organization of production on the basis of the workers. This is the epoch of the decomposition and break-up of the world capitalist system, which will mean the break-up of European culture in general if capitalism with its irreconcilable antagonism is not destroyed." The war has brought the populations of the world face to face with the realities of capitalism: what was before the theory and speculation of a few has become the bitter experience of millions. "The contradictions of the capitalist system were converted by the war into degrading torments of hunger and cold, disease and savagery for all mankind." They have seen the vanity of the hopes of peaceful progress in face of the iron onward sweep to destruction of the existing system. "The catastrophe of Imperialist war has with one swoop swept away all the gains of experts and of Parliamentary struggles." Not only the populations of Europe, but the colonial populations of Asia and Africa, have been dragged into the vortex, and are now finding their only chance of liberation in the international communist revolution. In the midst of this world upheaval there is need of a strong revolutionary power that can alone form the coherent force to carry through the necessary change and establish the new system. Reaction solves nothing, and half-measures are fatal. "Only the proletarian dictatorship, which recognizes neither inherited privilege nor rights of property, can shorten the period of the present crisis, and for this purpose will mobilize all materials and forces, introduce the universal duty to labour, establish the régime of industrial discipline, and in this way heal in the course of a few years the open wounds caused by the war and raise humanity to understand of heights." It is the conditions of society that are producing chaos and revolution; it is the object of the communists to end those conditions by giving conscious direction to the instinctive forces of revolt, instead of vainly seeking to stem them. No error, in fact, could be greater than to suppose that the communists are out to \"make\" a revolution in order to impose their system upon mankind. "The Communist parties, far from conjuring up civil war artificially, rather seek to shorten its duration." In the communist conception the alternative to proletarian dictatorship is not peace. It is war and blockade, famine and disease, blind revolts and the break-up of civilization. Communist and Democracy.—It is from the point of view that the whole controversy between democracy and dictatorship should be approached if the communist position is to be understood. The communists do not reject the current conceptions of democracy because they believe in the superiority of the few, but because they believe that the phrases of democracy bear no relation to present realities. The divorce between the realities of power and the theory in modern democratic states has been noted by observers of all schools; it is the special point of the communist to insist that this divorce is not due to accidental and remediable causes, but is inherent in the nature of capitalist democracy. Democracy, in fact, is held to be unrealizable in capitalist society because of the fundamental helplessness of the propertyless man; the parliamentary forms only serve to veil the reality of the \"bourgeois dictatorship\" by an appearance of popular consent which is rendered unreal by the capitalist control of the social structure; and even this veil is cast aside in moments of any stress by the open assumption of emergency dictatorial powers. The plea that this situation may be remedied by education and propaganda is met by the reply that all the large-scale organs of education and propaganda are under capitalist control.

On the other hand communism, while rejecting current democracy, differs from syndicalism and other revolutionary philosophies which proclaim the right of the \"militant minority\" to enforce its will by force of arms and the coup d\'etat which really belongs to the Blanquiist school, which was always vigorously opposed by Marxism. Marxism taught that the liberation of the workers could only be the act of the workers themselves, and that all the communists could do was to endeavour to guide the struggle of the workers into its realization in the dictatorship of the proletariat. In this way the Bolsheviks did not carry through their revolution of Nov. 1917 until they had gained the majority in the Soviets and the trade unions. Where the communists differ from other believers in the ultimate victory of the working class is that they do not believe that victory will be achieved until after a very much more severe struggle than is ordinarily contemplated. They believe that the ruling class will use every means, political, economic and military, to defend its privileges, and that the final decision will not be reached without open civil war. In support of this they quote evidence to show the readiness of the ruling class in many countries to fling constitutional considerations to the winds when their privileges are in danger. To mistake dislike of this prospect for evidence of its improbability they regard as a fatal policy, and they believe it necessary, therefore, to make preparations for the event, considering the best guarantee against the chaos of prolonged social disorder (otherwise inevitable in the period of capitalist dissolution) to be the existence of a powerful revolutionary party. It is this aspect of communism which has led to the current distinction between communism and other forms
of socialism as a difference of method: but it will be seen that this difference of method arises from a far more fundamental divergence in outlook and philosophy. The methods of the communists are not comprehensible save in relation to the whole philosophy of The Communist Manifesto, the Theory of Organisation. From the above considerations certain conclusions follow as to the rôle and character of the communist party in any country. The fully organized communist party, it is stated, is to be the "advance guard" of the working class, never regarding itself as separate from the working class, always working in and through existing working-class organizations on the plane of the struggle of the moment, but always coordinating and giving conscious direction to the different aspects of the working-class struggle with a view to the larger ultimate issue. For this purpose it must be based on the strictest internationalism and must have as its supreme end victory of the working class. But this internal strictness of theory and discipline must be accompanied by an external policy of revolutionary opportunism which is in contrast with the usual "purism" of the revolutionary sect. This is the explanation of the alternate charges of "dogmatism" and "opportunism" which are levelled by other socialists against the communist party. This discipline is ultimately international in character, because the struggle is regarded as international. To the communist the International is more than a coming-together of sympathetic parties in a common struggle: it is the union of different divisions in a single army, each striving in its own way with its own weapons but supported by a single unified directing centre. For this reason an absolute ultimate authority is vested in the International Executive, subject to the World Congress. This authority of the International is regarded as of particular importance, not only for the immediate struggle, but as the nucleus of future international authority in the World Soviet Republic.

Bibliography.—The classic statements of communism are contained in the writings of Marx and Engels, in particular, The Communist Manifesto by Marx and Engels (1848); The Eighteenth Brumaire (1852); Capital (1867); The Civil War in France (1871) and the Critique of the Gotha Programme (1875) by Marx; and The Origin of the Family, Private Property and the State (1884) by Engels. The Life and Teaching of Karl Marx by Max Beer (1918, English translation 1921), gives a valuable short summary of his theories. The controversial literature of Marxism is very extensive, and would need a special bibliography. The most important documents of modern communism are the writings of Lenin, especially The State and Revolution (1917) and Left Communism, an Infinitesimal Disaster (1920); the writings of Trotsky, incl. his The Russian Revolution, 1917 (1920); Bukharin's Programme of the World Revolution (1920), and other writings of the Russian leaders; and the publications of the Communist International, including the Communist Manifestos (1918 and 1920), the Theses and Statutes of the Communist International (1920) and the monthly organ The Communist International. Presentations by English workers of communist theories may be found in R. W. Postgate, The Bolshevik Theories of Karl Marx (1918); Paul Sperry, The Revolution of 1917: Its Problems and Prospects (1920); and the various criticisms of communist theories see Karl Kautsky, The Dictatorship of the Proletariat (1919); J. R. Macdonald, Parliament and Revolution (1919), and Bertrand Russell, The Practice and Theory of Bolshevism (1920).

R. P. D. W.

COMPASS (see 6.804). In view of the large extension of the field covered by the term "compass" due to the introduction of the "gyro compass" and its adoption for navigational purposes, it is essential to define exactly what is meant by a word which is being very loosely applied to instruments of no practical navigational value.

The compass is an instrument designed to seek a certain definite direction in azimuth and to hold this direction permanently. For use in navigation, a compass must satisfy the following practical requirements:—

1. Magnetic compass—When disturbed should return to within 1° of the above direction within 2 minutes of time.

2. Gyroscopic—When disturbed or started should return to within 1° of the above direction within 3 hours.

The description given in the earlier article may be taken as generally applicable to the magnetic compass of the present day; a very great extension, however, in the use of the gyroscopic type for practical purposes of the ship's movement, while for aeronautical use the liquid compass is essential. The British Admiralty compass department now occupies the "Compass Observatory" at Langley, Bucks., and deals with compasses of all types both for the Admiralty and Air Ministry. A comprehensive museum is now attached to the observatory.

Gyro Compass.—The gyro compass is an instrument in which the earth's rotation is used, but the principles of a rapidly spinning body to indicate some fixed direction relatively to the earth. Up to the present the only successful models have been definitely North-seeking, and all such compasses consist essentially of:—

1. A wheel mounted so as to be capable of spinning rapidly without vibration about its axis and also free to point that axis in any direction.

2. A gravity control of some description which restricts the tilting freedom of the axis of the wheel.

Modern gyro compasses differ somewhat in the mechanical devices by which the degrees of freedom of the axis are obtained and in the methods adopted to provide the gravity control; but they are all the practical outcome of experiments made in 1852 by Foucault to demonstrate the rotation of the earth by means of a gyroscope. Edward Sang, of Edinburgh, had described in 1850 how this could be done; but he did not actually carry out the experiment. Much later, in 1884, Lord Kelvin exhibited a model gyro compass before the British Association. Early in the present century the development of submarines called for a non-magnetic type of compass, and fortunately the advance in electrical and mechanical science made it possible for Dr. Anschutz to utilize this pioneer work and evolve the first practical gyro compass. In this instrument a single gyro was used and both the tilting and the azimuthal freedoms were obtained by attaching to the gyro case a float supported in a bath of mercury. A full account of this compass and the elementary mathematical theory of it is to be found in Crabtree's Spinning Tops and Gyroscopic Motion. The chief objection to this compass was its failure to function correctly if the ship was rolling, especially when on a quadrantal course. This intercardinal rolling error was, for some time, a stumbling-block to further progress, but in modern gyro compasses it is almost non-existent.

Anschutz in 1912 brought out a very different instrument which was adopted by the German navy. In this model three gyroes are used in place of the single one of the earlier model, the two extra gyroes having been introduced to overcome the rolling error. About the same time, the Sperry Co. of New York put on the market their gyro compass. The first model was found, on trial, to be subject to rolling error and this necessitated an alteration in design, a small gyro-pendulum, called the floating ballistic, being introduced. This compass, in its modified form, was very largely used by the British and Allied navies during the war.

More recent types are the Brown, Carrie and Twin Sperry. The first is an entirely British-made compass and has many novel features; in particular, the device used to obtain the azimuthal freedom and the gravity control. It is small and light, the whole as fitted in the binnacle weighing about 15 pounds.

Certain very important modifications of the Sperry compass were developed by the Admiralty compass department as a result of war experience, especially the mercury control attachment invented by Commander G. B. Harrison, O.B.E., and Mr. A. L. Rawlings; this simplifies the construction of the compass, reduces its cost and makes it more efficient, particularly in bad weather (fig. 4).

The most important constants of the Anschutz, Brown, and Sperry wheels are as follows:—

Precession.—So far as gyro-compass work is concerned the phenomenon of precession may be described in the following manner. If a torque is applied to a free gyro in any plane passing through the gyro-axis then the axis will precess in a plane perpendicular to the plane of the
COMPASS

spin; and the sense of the precession is such that it causes the plane of the spin to move towards the plane of the torque as if to secure agreement of sense after one quarter-turn.

The Sperry Compass.—The Sperry type being the most universally known is used in the following discussion as a convenient example to illustrate the principles of gyro compasses. It consists essentially of a gyro mounted so as to be free to spin, free to tilt about a horizontal axis (called the sperry axis), and free to tilt about a vertical axis. Normally, only the freedom of the horizontal tilt is used. The blockage freedom is modified by the addition of a gravity control in the form of a ball weight, fastened to the case by a roller connection at one point only.

For the present it will be assumed that this roller connexion is in the vertical plane through the gyro-axis, so that whenever the gyro-axis is tilted the gravity control only produces a torque on the gyro in the vertical plane. On account of the earth's rotation the N. end of the gyro-axis will, whatever it is, West of the meridian be tilting upwards and as a result of the gravity control, whenever the N. end of the axis is tilted below the horizontal plane it must be precessing East. This precession, however, is relative to space and not relative to the earth.

It follows that such a gyro compass will have, at the equator, a resting-position in which the gyro-axis is horizontal and in the meridian. At a place in N. lat. the gyro-axis, in its resting-position, will be in the vertical plane through the gyro-axis and tilted up slightly. The gravity control may provide a torque in the vertical plane sufficient to cause the gyro-axis to precess in azimuth at a rate equal to that at which the meridian is turning round the vertical plane.

With the Sperry constants the tilt required is about 8° of arc in lat. 53°, for this tilt produces a torque of 8 × 10⁻⁶ as degrees per hour or about 12° per hour. (Mass of ball = 10 lb.; depth of G. O. below tilt axis = 6 in.) Further, if the gyro-axis is disturbed from its resting-position it will have a restoring torque due to the tilt of position but will not settle again unless there is sufficient friction to damp out the oscillations. Such friction must always be reduced to a minimum as it involves a degree of unsteadiness in the resting-position.

In order to damp out any oscillations of the gyro-axis the roller connexion between the ball weight and the case is placed slightly to the E. of the vertical plane through the gyro-axis. This roller connexion will, in what follows, be referred to as the "eccentric pivot." With this arrangement whenever the N. end of the gyro-axis is tilted above the horizontal plane there are two torques acting on the gyro, both proportional to the tilt;

(a) one acting in the plane as before, and
(b) the other in a horizontal plane.

The second torque is the damping torque and always acts in the sense opposite to that of the eccentric pivot. For the effect of the gyro-axis to be always reduced to the tilt whatever be the tilt on the horizontal plane. By reducing the tilt it lessens the torque producing the azimuth precession and so diminishes the amplitude of the oscillations and consequently damps out the oscillations.

The angle between the two planes through the gyro-axis which pass through the slope diameter and the eccentric pivot respectively is called the eccentricity of the pivot, and is usually about 1°. By increasing this eccentricity the damping can be made heavier the value 7° being enough to give to the Sperry compass a dead-beat movement in all latitudes. The damping error, or latitude error as it is sometimes called, varies as the eccentricity of the pivot and the tangent of the latitude. In the meridian plane the damping torque maintains the slight precession of the gyro-axis in the vertical plane necessary to keep the tilt constant although the axis is not in the meridian.

The resting-position in any latitude can be adjusted to be horizontal in the meridian plane by putting out a vertical and a horizontal line on the compass card. Imagine a weight put on the N. side of the case sufficient to produce the torque in a vertical plane required to keep the gyro-axis precessing at the same rate as the meridian is turning round the vertical. The vertical lines in the resting-position there would be no tilt and no pressure at the eccentric pivot, no damping torque and no damping error. That is, the gyro would settle with its axis horizontal and in the meridian. This gives due to the effect of a change in the horizontal balance on the resting-position—making this balance N. heavy reduces the upward tilt of the N. end and causes it to settle to the W. of its normal resting-position.

The vertical lines in the resting-position of these compasses may not be seen in the case of a twist in the suspension. This merely introduces an extra torque in a horizontal plane and so either increases or decreases the damping torque and therefore the damping error. Hence the only effect on the resting-position is to introduce a change in azimuth in the sense of the twist.

The preceeding remarks refer to a compass in a binnacle fixed relative to the earth. When the compass is free to tilt, as the case in a vessel mounted on its vertical plane, further complications arise. That part of the earth's rotation which is essential to the working of a gyro compass is the tilting movement of the horizontal plane about a N.-S. line. This tilting movement is due to the rotation of the earth with the same angular velocity that the ship's speed is but a small fraction of that due to the earth's rotation, this direction will be only slightly W. of N. Hence for northerly speeds the compass has a resting-position which is the same as its normal one and its value in radians is given approximately by the expression

Northerly speed of ship

Easterly speed of the latitude circle

For British latitudes it is roughly 1° per 10 knots. The error for southerly course is E. and for east or west course it is zero. Thus it is clear that every alteration of course will involve a change in the resting-position of the compass. Take the case of a ship which, when steaming N. at 20 knots, alters course to S. The gyro compass, supposed to be tilted when the ship is steaming S., would be pointing some 3° W. of its normal resting-position; at the end of the turn the new resting-position will be 2° E. of the normal one and so 4° E. of that for the northerly course. But during the turn there has been a southwards movement of the ship for the bail weight, acting as a pendulum in the N.-S. plane, to lag behind the north. Hence it exerts a pressure (due to the acceleration) on the case at the eccentric pivot, and so produces two torques on the gyro:

(1) in a vertical plane sense N.-Z.-S.;
(2) in a horizontal plane sense W.-E.

The former of these is the twist and is that which is toward the new resting-position for the southerly speed. The angular displacement of the gyro-axis thus obtained is called the ballistic deflexion. If the constants of the compass are so arranged that this deflexion is exactly equal to, say 4°, and the ship is steaming N., then during the turn the gyro-axis will have moved in azimuth exactly to its new resting-position. But the ballistic deflexion is independent of the latitude, whilst the change of speed error varies with the latitude. Hence this adjustment can only be made correctly in one particular latitude called the standard latitude. To obtain this effect the constants of the compass must be adjusted so that its undamped period is 35 minutes in the standard latitude. This is the reason why all gyro compasses of this type have periods approximating to 1 hour.

The torque in the horizontal plane produces no such beneficial results. It causes an upward precession of the N. end during the turn. This being increased by the vertical speed of the ship, the S. speed requires the same tilt of the N. end as that for the N. speed, the gyro-axis will begin to wander, alter the turn is completed towards the west. This change of speed error is also corrected for by an adjustment in the Anschutz and Brown compasses because the acceleration causes a transference of the oil in the damping mechanism. In order to reduce the effect of this error the eccentricity of the pivot is kept small in the Sperry compass.

The mercury-box attachment to the Sperry compass provides a means of making the ballistic deflexion approximately correct in all latitudes, and is noteworthy as being the only practical device which so far has overcome this difficulty. The gravity control consists of two cast-iron boxes containing mercury and joined together by a long U tube which enters both boxes at the bottom. This is essentially a top-heavy form of gravity control and the magnitude of the torque exerted by it depends on the area of the free surfaces of mercury in the boxes. Each box is divided by vertical partitions into three compartments. The vertical plane through the box, actuated by turning a knob at one bottom corner, enables the area of the free surface—and so the magnitude of the bail weight—to be varied in the ratio 3:4:5:6. By means of this device the ship's position is indicated by the free surface of the fluid on the outside of the system, which is equal to the change of speed error within 1/4 in any navigable latitude.

Further complications arise due to the rolling and pitching of the vessel. A swinging ring oscillates stably in its own plane but not in any other plane. The direction of rotation of this ring is affected by a diameter and about a line through the centre at right angles to the plane of the ring, not equal. This inequality is corrected by the outer pair of inertia rings of the compensator mechanism and this is done by the attachment of the compensator weights and frame to the vertical ring. In addition, with the ship on an intercardinal course, say N.E., and rolling, the compass in the binnacle is subject to an alternating second moment of inertia in the plane of the vessel. The effect of this parameter of the compass causes the compass as a whole to swing in the gimbals in the plane of the case, and so the eccentric pivot swings E. and W.
of its true position relative to the vertical through the gyro-axis. The N.-S. component causes the ball-weight to exert an alternating pressure on the case at the eccentric pivot, first N., then S. These two alterations, the E.-W. swing of the pivot and the N.-S. pressure at the pivot, keep step, and so a torque of invariable sign in a horizontal plane is produced. This causes the gyro-axis to tilt and wander and so introduces rolling error. To get rid of this error Sperry aimed at eliminating the E.-W. swing of the pivot by making use of a small gyro pendulum, called the floating ballistic, to form the connexion between the ball weight and the case. This fitting gave excellent results except in bad weather; a further modification, obtained by the addition of a frame, carrying a lead weight, to the stem of the pendulum, in order to raise its centre of gravity and so increase its period, produced a great improvement. Even so the compass was not quite reliable in really bad weather, and it was not until the mercury control was fitted that the intercardinal rolling error was finally overcome. In this device the period of the liquid pendulum is so arranged that the forced oscillations of the mercury due to the rolling of the ship are approximately 90° out of phase with the roll, and so complete compensation is obtained.

The gyro and case in its vertical ring, known as the sensitive element (see figs. 1, 2 and 3), is supported from the top of the phantom or follower ring by a wire suspension. The vertical ring is also provided with upper and lower guide bearings in the phantom. These bearings do not support any of the weight, the whole of which is taken by the suspension. Suitable trolley contacts (not shown in the diagram) are carried on the trolley posts and work over fixed contactors situated opposite them on the upper part of the phantom. The compass card is fixed to the top of the phantom ring and the rack just below it gears into the azimuth motor which is fixed to the frame or spider. The trolley and fixed contactors are suitably connected to the relay of the azimuth motor.

FIG. 1.—Thwartship section of frame. South view of compass.

Mechanical Operation of the Compass.—In the Sperry compass a follow-up system is essential to the correct functioning of the master compass; in other types, such as the Brown and Anscharz, this is not the case. The reason for this lies in the different methods of suspension, all of which must be as nearly free from friction as possible, as has been previously stated.

FIG. 2.—Aft view of frame. North view of compass.

The gyro and case in its vertical ring, known as the sensitive element (see figs. 1, 2 and 3), is supported from the top of the phantom or follower ring by a wire suspension. The vertical ring is also provided with upper and lower guide bearings in the phantom. These bearings do not support any of the weight, the whole of which is taken by the suspension. Suitable trolley contacts (not shown in the diagram) are carried on the trolley posts and work over fixed contactors situated opposite them on the upper part of the phantom. The compass card is fixed to the top of the phantom ring and the rack just below it gears into the azimuth motor which is fixed to the frame or spider. The trolley and fixed contactors are suitably connected to the relay of the azimuth motor.

This electrical follow-up system operates so as always to keep the phantom co-planar with the vertical ring. If the gyro precesses in azimuth the trolley wheel is carried to one side or other of the fixed contactor which is insulated in the middle; this operates the azimuth motor through the relay and moves the phantom which carries the compass card, to follow the gyro. On the other hand, when an alteration of course takes place the phantom is at first carried round by the ship until the contacts cause the azimuth motor to drive it back to its normal position in relation to the vertical ring.

In addition to the master compass, which is usually placed more or less centrally in the ship and near the water line, repeater compasses form part of an equipment and may be placed in any convenient position.

FIG. 3.—Starboard view of frame. West view of compass.

They are worked through a transmitter which is operated by a pinion working into the phantom rack just under the compass card. This pinion forms the head of a camshaft which carries three double-faced cams set 60° apart. These cams operate contacts which, using a common return, work the repeater motor. The speed and latitude dials in conjunction with the cosine ring provide an automatic correction for both speed error and damping error, by turning round the rubber ring through an angle equal to the sum of these errors.

As seen from the S. side the direction of rotation of the wheel is clockwise, but this must be reversed when the mercury control is fitted, because this form of gravity control is top-heavy.

References.—For a detailed description of the whole equipment and instructions as to the care and maintenance of the Sperry compass, the Sperry Handbook, 2nd ed. Feb. 1919, gives full information. This, and a handbook on their Twin Compass, may be
In spite of this decline, the total value of farm property increased by 40-7% during the decade. In 1910 the average value of land per ac. was $33.03; in 1920 it was $53.28. The most important crops of the state were wheat, corn, and tobacco. The rapid growth of the cities has stimulated dairying, market gardening and egg raising. During the World War a Farm Bureau was introduced into each of the communities of Connecticut to work for the farmers in the state, making for better farming and the solution of the local agricultural problems.

Manufactures.—Connecticut is one of the preemi

in machinery, mining and transportation. In 1915 the state contained 4,104 manufacturing establishments employing an average number of 222,664 wage-earners, and the 5th among the states in number of wage-earning employees. The most important branches of manufacturing were the following:

The outbreak of the World War speedily brought profound changes to Connecticut manufacturing. Inevitably, large war orders came the bell of the state foundry. Not only did munitions plants grow, but many other factories benefited by making accessory parts such as springs for shells, bases for machine-guns, etc. A rough measure of the effect of the new situation is to be found in the building products of the state. During the years 1913 and 1914, 254 manufacturers constructed 386 buildings at a cost of $6,388,230. In 1915 and 1916, 291 manufacturers built 627 buildings at a cost of $16,287,825, nearly four times the amount of the preceding two years. The expansion continued during 1917 and 1918, when 586 manufacturers engaged in 738 building operations at a cost of $13,537,802, but in the summer of 1920 it came to a practical stop. The Armistice set in at that time. In May 1918 Gov. Holcomb stated that 80% of Connecticut manufacturing was "directly or indirectly engaged in producing munitions, rifles, machine-guns, clothing and other articles used by the army; and we have within our borders where ships and power-boats are being constructed."

With the signing of the Armistice and the cancelling of war orders, Connecticut factories began to reorganize. The readjustment to a peace footing was made easier by the great demand for manufactured goods that characterized the year 1919, and had been practically completed throughout the state when the depression of 1920-1 brought a considerable slowing up of productive effort. The growth of manufacturing, coupled with the increase in the cost of living that followed the outbreak of the World War, brought labour troubles to Connecticut. Before the war the wage-earners of the state were in no way organized, but in the years 1912, 1913 and 1914 the state organized labor unions numbered 12,821. The years of the great expansion, there were 422 strikes, involving approximately 68,000 employees. In the next two years there were 183 strikes involving 33,200 employees. From that time on the number of strikes diminished in number until the depression of 1920-1, when because of wide-spread unemployment they practically ceased. The rapid changes in the manufacturing situation from 1918 to 1921 and the constant shifting of the wage-earning population made it difficult to collect statistics of value regarding the labour organizations. In 1918, however, there were 327 labour organizations in the state, mostly among the skilled trades and transportation workers. Factory employees were in general not unionized. In 1911 the total number of strikes was 1,947, with 7,045 workmen involved. In 1913 and 1914, the years of the great expansion, there were 422 strikes, involving approximately 68,000 employees. In the next two years there were 183 strikes involving 33,200 employees. From that time on the number of strikes diminished in number until the depression of 1920-1, when because of wide-spread unemployment they practically ceased. appeals from whose findings may be made to the superior court of the county. In the physical examinations for the draft during the World War, 20.79% of those examined were disqualified for physical disability, Connecticut being the seventh highest state in this percentage of males. In over 400 cases, males under 30 years of age showing habitual disorders were due to preventable conditions in childhood. The result was the appointment of a commission to report a programme for child welfare. The commission reported in 1921. It was made up at the time that all Connecticut residents under the draft law were aliens. Only one state had a higher percentage. The result of this situation was a vigorous movement for the Americanization of aliens.

Education.—Beginning July 15, 1909, the organization of public education changed from the district type to that of town management. There were in 1921 less than ten towns in the state that had not adopted town management. The law made all the town schools subject to the control of the town board. It was traveled by the enactment providing that after Sept. 1, 1911, no employment certificate of any description could be accepted by any employer except such as were issued by the State Board of Education. On July 1, 1921 a law went into effect providing that all new public school teachers pay annually 5% of their salary into a pension fund. At the end of 35 years (changed to 30 in 1919), the last 15 of which must be in the corporation, a quite large number of the teachers might retire and receive the annuity which his or her contributions and accrued interest would warrant. To this the state would add as a pension a sum equal to the annuity. Special provisions were made for teachers in special schools, in the city of New York, in the city of New Haven, and in the city of Hartford. In 1911 a charter was granted for a woman's college at New London, and in 1914 it was opened as the Connecticut Women's College. H. S. Sykes was president.

In 1920 the corporation of Yale University announced the establishment of a Department of Education in the graduate school, designed among other things to train superintendent, supervisors, principals, directors of special activities, research specialists, normal and college instructors in education and class-room teachings. Further information regarding Yale University, see that heading.

History.—In 1912 it became known to the public that the financial condition of the New York, New Haven, and Hartford railway was unsound. The dependence of the people of the state on the road was made clear by a statement of the road's president, Mr. Howard Elliott, that in 1913 the road controlled 942 of the 1,000 m. of steam road in the state, and in addition was interested in separately operated trolley lines aggregating 605 m. out of a total of 912 miles. This dependence was augmented by the fact that (to quote Gov. Holcomb) "the securities of the railway are held largely by 61,000 real estate agents and other occupation, previous military training, nationality and whether or not they were citizens. It was the pioneer military census within the United States and served as a model for those of other states. The Home Guard of Connecticut, formed March 9, 1917, rose to 10,000 men. During the summer of 1917 the 26th Division was organized from the New England National Guard. Of the units in that organization the following came from Connecticut: the 1st and 2nd Conn. Infantry became part of the 102nd Infantry; two batteries of Conn. Field Artillery became part of the 103rd Field Artillery; the Conn. Cavalry became part of the 102nd Machine Gun Corps, and the 1st New Haven Field Hospital became part of the 101st Sanitary Train. The division established its headquarters in France at Neufchâteau, Oct. 31, 1917. It participated, among other actions, in the Aisne-Marne, the St. Mihiel and the Meuse-Argonne offensives. During the formation of the 26th Division, preparations were being made for the National Army. The 1st Provisional Training Regiment was organized at Plattsburg, N. Y., May 15, 1917. To this regiment Connecticut sent her officer candidates to train for commissions. On Aug. 15, 1917, the 18th Division was organized at Camp Devens, Ayer, Mass., its officers below the rank of lieutenant-colonel being drawn almost entirely from the 1st Provisional Training Regiment. The bulk of the drafted men from Connecticut went originally to this division. In July 1918 the division established headquarters in St. Amand-Mont-Rond, France, and became the 3rd Depot Division. The number of Connecticut men drafted under the Selective Service Act was 34,574; this figure does not include the numerous volunteers in the armies of the United States or of the Allies. The number who died was 3,105. The amount subscribed by Connecticut in the first War Loan was $437,476-

Connecticut failed to ratify either the 18th (Prohibition) Amendment or the 19th (Woman Suffrage) Amendment to the Constitution of the United States. The governors of Connecticut in the years following 1909 were: Frank B. Weeks, 1909-11; Simon E. Baldwin, 1911-5; Marcus H. Holcomb, 1915-21; Everett J. Lake, 1921-

CONRAD, JOSEPH (1857-1924), English novelist (see 6.068). Lady Chatterley's Lover includes a study of the revolutionary temperament, Under Western Eyes (1911); an autobiographical set of Reminiscences (1912); three volumes of short stories, Twist Land and Sea (1912), Within the Tides (1915) and The Shadow Line (1917); as well as 4 novels, Chance (1914); Victory (1915); The Arrow of Gold (1915) and The Rescue (1920). A dramatized version of Victory was played at the Globe theatre, London, in 1920.

CONRAD VON HÖTZENDORF, COUNT (1832-1910), Austrian field-marshal, was born at Vienna, and after graduating at the military academy of Wiener Neustadt entered the army as lieutenant in a Jäger regiment. He finally reached the general staff, and distinguished himself during the fighting in Bosnia and Herzegovina in 1878 and 1881. He continued to be employed mainly on the general staff, especially as lecturer on tactics in the Kriegsschule (the highest military academy), and he gained the reputation of an authoritative writer on military subjects. Among the many people in whom he inspired confidence was the heir to the throne, the Archduke Francis Ferdinand, by whose influence he was appointed in 1906 to succeed Count Beck as chief of the general staff. He displayed extraordinary activity, concerning himself not only with the work of his office, but with matters of internal, and still more of foreign, policy. This brought him into increasingly sharp discord with the Foreign Minister, Count Aehrenthal. Conrad was filled more particularly with the deepest distrust of Italy, and, convinced as he was that it would be impossible to avoid a struggle for the very existence of the Habsburg Monarchy, he wished to precipitate this struggle while the chances were not unfavourable. The latent opposition between the two men led to Conrad's temporary retirement in 1911. At the end of 1912 he was recalled to his post and in 1914 agreed to the military measures against Serbia which led to the World War. At the end of two years of the war he was the real leader of the Austro-Hungarian armies. Though he was not always successful in the unequal struggle, the essential credit of the great success at Gorlice (1915) must be ascribed to him. To him also are due a series of successful operations, although a decisive victory was denied him. In 1917 he assumed the command of the forces operating in Tirol, and took part in every engagement until the battle of the Plave in the summer of 1918. After this he retired from
active service, was raised to the rank of count, created a field-marshall, decorated with numerous orders, and appointed commander of the Imperial Guard. Conrad was one of the most predominant personalities of the fallen monarchy, whose fate he was unable to avert. In his active military operations his most distinguishing colleague was Gen. Metzger (b. 1870), who, after Conrad's retirement, took over a high command, distinguishing himself on the Italian front and finally in France in cooperation with the German armies.

(2) English philanthropist (A.-K.) CONRAN, Brian, M.A. (1838-1912), was born in London March 4 1838. As a young woman she studied art, but, owing to an acquaintance with Miss Octavia Hill, became interested in social work, and in particular in questions of housing. She became best known, however, for her work in connexion with Morley College and the Royal Victoria Hall, Waterloo Road, generally known as the "Old Vic." At one time a well-known theatre, it had degenerated into a disreputable haunt where nothing but the lowest melodramas were played. Miss Cons, whose social work in Lambeth had made her well acquainted with the difficulties of providing decent amusement at a cheap rate for the inhabitants of the poor district, was brought into the building about 1880. It was enlarged and improved, the sale of drink was forbidden, and miscellaneous programmes of music, drama, and lectures were embarked upon. In 1882 the wealthy manufacturer and philanthropist Samuel Morley began to take an interest in the affairs of the Hall, and in 1884 he joined the executive committee. He contributed a large amount of money to the scheme, and his unfailing sympathy and practical business advice were of the greatest value. His death in 1886 was a great blow to the work, but his name has been perpetuated in the foundation of the Morley College for working men and women, which developed from the lectures given at the "Old Vic." Its first vice-principal was Miss Caroline Martinu, a friend and co-worker of Miss Cons, and the institution now has over a thousand members. Miss Cons's work bore fruit after some years in the excellence of the entertainments provided and the high repute which the "Old Vic." attained. In 1889 concert performances of grand opera were started, and in 1896 a chorus was formed, thus making it possible adequately to present the operas. In 1905 symphony concerts were embarked on, and continued for several seasons. Miss Cons was elected to the first governing body (1898), and was chosen an alderman, but retired owing to difficulties raised as to the right of women to sit. She died at Heather, Kent, July 24 1912.

Her sister, Ellen Cons (1840-1920), was also closely associated with many philanthropic schemes, and was one of the governors of the "Old Vic." She died in London June 25 1920.

CONSERVATION POLICY.—The name "Conservation" has been given in the United States to the movement for using and safeguarding the natural resources of the country (or indeed any country) for the greatest good of the greatest number of the inhabitants for the longest time. It is a fundamental misconception to suppose that Conservation means nothing but the husbanding of resources. The first principle of Conservation is use, but it refuses to recognize needless waste and destruction as normal processes in the proper development and enjoyment of natural wealth. This conception of Conservation as a principle to be followed by the American Government was first brought into prominence by the Chief Forester of the United States during the Roosevelt administration, and was first applied to forest protection.

As with all nations that are both rich and young, a general indifference to the protection and preservation of its natural resources had marked the history of the United States. The rapid and reckless destruction of the forests was the first cause of a change in the attitude of the American people toward natural wealth. Effective action toward the protection and preservation of natural resources was not taken until long after the early warnings, which were heard nearly a century before the Conservation movement was born. In 1812, more than three score years before forestry had secured a foothold in America, a French naturalist, André François Michaux, in his work The North America Syva, spoke thus of the destruction of forests in America:

"... neither the Federal Government nor the several states have reserved forests. An alarming destruction of the trees proper for building has been the consequence—an evil which is increasing with the increase of population. The effect is already very sensibly felt in the large cities, where the complaint is every year becoming more serious, not only of excessive dearth of fuel, but of the scarcity of timber. Even now inferior woods are frequently substituted for the White Oak and the Live Oak, so highly esteemed in ship-building, will soon become extinct upon the islands of Georgia."

Conservation, as an American problem, received its first recognition in the work of the Inland Waterways Commission. On Oct. 3 1907 this commission suggested to President Roosevelt, who had created it, the calling of a conference of governors to consider the condition of the natural resources of the United States. The conference assembled May 13 1908 in the White House at Washington. Among those in attendance were the President, the Vice-President, 7 of the 9 members of the Cabinet, the 9 justices of the Supreme Court, the governors of practically all the states and territories (including Alaska, Hawaii, and Porto Rico), numerous members of the Senate and the House of Representatives, representatives of 68 national societies, more than 50 citizens selected for their special attainments, and the members of the Inland Waterways Commission. This was the first time the governors of the states met in conference, and the gathering was unique in American history.

The conference, after deliberating for some days, adopted a declaration containing the following passage:

"We agree that further action is advisable to ascertain the present condition of our natural resources, and to promote the conservation of the same: and to that end we recommend the appointment of each State of a commission on the natural resources to cooperate with each other and with similar commissions of the Federal Government."

In accordance with this recommendation, the governors of 42 states promptly appointed state conservation commissions, and less than a month after the conference had closed President Roosevelt appointed a National Conservation Commission, divided into four sections dealing respectively with waters, forests, lands and minerals. The commission was directed by the President to investigate and report to him regarding the condition of the natural resources, and to recommend to him measures for conserving them. As the commission had no funds at its disposal, the President directed the heads of departments at Washington to place their officers and facilities at the service of the commission. Thereupon the commission undertook, for the first time in the history of any nation, to prepare an inventory of the natural resources of the country.

The report of the commission was presented to the President in Jan. 1909, and was by him transmitted to Congress with a special message concurring in its statements and conclusions, and recommending it to the consideration of Congress and of the people generally. After making its report the commission continued its efforts in cooperation with governmental and extra-governmental agencies for the conservation of natural resources, in order both to extend its inventory and to determine what specific laws were needed for the wise and orderly development of the country's natural wealth. Unfortunately, this constructive work was stopped by the abolition of the commission through a law enacted by Congress later in the same year. Meantime President Roosevelt had invited the governor-general of Canada, the governor of Newfoundland and the President of Mexico to appoint commissioners to discuss, with commissioners representing the United States, the principles of conservation in their respective countries. As a result of this movement, the first N. American Conservation Congress was held in Washington in 1909. President Roosevelt in Feb. 1909, after consulting the Queen of the Netherlands, invited the powers of the world to meet at The Hague for the purpose of considering the conservation of natural resources everywhere. Although a majority of the nations accepted this invitation, the project, after President Roosevelt's retirement from the presidency,
was allowed to die. During the administration of President Taft the struggle for conservation centered in the so-called Ballinger-Pinchot controversy, the cause of which was an effort on the part of Richard Archibald Ballinger, then Secretary of the Interior, to transfer to private ownership certain valuable coal lands in Alaska, and to throw open to private acquisition highly valuable water-power sites upon the public lands which had been set aside by President Roosevelt. The controversy resulted in the resignation of Mr. Ballinger, and had much to do-with the defeat of President Taft in the election of 1912. The coal lands and water-power sites which formed the subject matter of the dispute remained in the public hands.

In the effort to secure the use of the natural resources so as to promote the greatest good to the greatest number for the longest time, President Roosevelt, in support of legislation by Congress to that end, withdrew from private entry 148,000,000 ac. of forest land, 80,000,000 ac. of coal land, 4,700,000 ac. of phosphate land, and 1,500,000 ac. containing water-power sites on the public lands. Thus during the Roosevelt administration more than 234,000,000 ac. of land were preserved, most of which will probably be permanent property of the nation.

Because of the abolition of the National Conservation Commission, the movement threatened to be seriously hampered by the lack of a central body in which could be contained for uniform and effective action the many persons and agencies devoted to the movement. Accordingly, the National Conservation Association, whose purpose was to inform and give effect to public sentiment, was established in 1909. In its successful efforts to prevent the passage of bad laws and to secure the enactment of good laws, this association became an effective factor in the passage by Congress of measures that carry out the Roosevelt policies of Conservation. The more important of these measures are: the Weeks law, to purchase lands for national forests in the White Mountains and the Appalachian Mountains where there was no public land; the Coal and Oil Leasing bills (for the continental United States, including Alaska) which are securing conservation by wise use, without waste and without monopoly, of valuable resources still in the public hands; and the Federal Water-Power Act, to provide for the development by private enterprise, under Federal ownership and control, of water-power in the public domain and navigable streams. Here again public property worth thousands of millions of dollars has been saved for the benefit of all the people of the United States. The association has been especially influential in defeating legislation that sought to destroy the national forests and to permit the diversion to private ownership of natural resources.

The Conservation movement is probably, among the many constructive policies inaugurated by President Roosevelt, that which will be most influential for good, and for which he will be longest remembered.

(G. P.)

CONSTANS—CONSTANTINE

739

CONSTANS, JEAN ANTOINE ERNEST (1853-1913), French statesman (see 6,986), resigned from the embassy at Constantinople in May 1909. His success as a diplomat was less marked than as a minister. Presenting himself for the Senate (for Aveyron) in 1912 he was defeated. He died April 7, 1913.

CONSTANTINE, King of the Hellenes (1868-1913), eldest son of George I of Greece, was born Aug. 2, 1868, and succeeded to the throne March 18, 1913, on the assassination of his father. As the first prince of a Greek reigning dynasty born in modern times on Greek soil, and reared in the Greek Orthodox faith, he became from his birth to the Greek people the embodiment of their national aspirations, and was given the name of the last Emperor of Constantinople, in the superstitious hope that he would fulfill the old prophecy that the Empire of Byzantium would be restored to the Greek nation, when a king named Constantine and a queen named Sophia should reign on the Greek throne. This strange legend strengthened Constantine's popularity amongst the Greeks, and when in 1889 he married Sophia Dorothea of Hohenzollern, daughter of the Emperor Frederick of Germany, the coincidence of the name enhanced immensely the superstitious belief of the Greeks. He received his early education under private tutors at Athens. At the age of 18 he was sent to Berlin for a military education, and served in one of the Imperial Guard regiments, attending also a few desultory courses at the university of Leipzig. It was during his stay in Berlin that he made the acquaintance of his future wife, and (very much against his father's wishes) formed the attachment that was destined to exert such an important influence on his career.

After returning to Greece he was given various military commands. In 1897 he was sent to Larissa to take command of the Greek army in Thessaly, just before the outbreak of the disastrous war with Turkey. At the close of the war the Crown Prince was probably the best-hated man in Greece. The popular enthusiasm which contributed the disasters to him and to his father. He still retained, however, his nominal post of commander-in-chief.

It was only in Aug. 1909, when the garrison of Athens suddenly revolted and demanded sweeping reforms, including the reorganization of the army and navy and the removal of the princes from all military commands, that Constantine and his brothers, George, Nicholas and Andrew, hastened to resign their commissions and to go abroad to escape the open hostility of public opinion. From this practical exile the Crown Prince first, and his brothers Nicholas and Andrew afterwards, were recalled and reinstated in their commands by Venizelos, when the latter became the all-powerful head of the Greek Government. The bill for the reappointment of Crown Prince Constantine as commander-in-chief of the army was bitterly opposed in the Greek Chamber by Theotokis, Gounaris, Ralli and other politicians, who a few years later were to become King Constantine's chief supporters. The army officers, too, with few exceptions, were much opposed to the bill. By a curious irony, it was only Venizelos' determined attitude that saved it from rejection. The Greek successes in the Balkan wars subsequently enhanced the Crown Prince's credit, and it was in an atmosphere of renewed popularity (Venizelos himself helping to exploit it) that he succeeded unexpectedly to the throne on his father's assassination.

King Constantine at once showed his monarchial spirit. He took to copying the modes of speech and action of his brother-in-law, the German Emperor. He began to speak, in his official utterances, of "My army" and "My navy"; to attend in person the swearing-in of the annual recruits and to impress upon them the extreme sanctity of their oath of allegiance to him. Officers were made to feel that their only hope of advancement lay in their devotion to the War-Jord. And when his younger daughter, the Grand Duchess, married in 1909, he gave the army and navy godfathers to the little princess. Such incidents attracted little serious attention at the time. But the subsequent course of events showed that the King was intent on converting the democratic, ultra-constitutional monarchy, which that of Greece had been, into one of a more absolute type on the Prussian model. Constantine and his defenders have indeed vehemently denied the existence of any secret understanding between himself and the Kaiser, either before or after the outbreak of the World War. Apart, however, from the indirect evidence furnished by the private telegrams exchanged between the royal couple of Greece and the Kaiser in 1916-7, which came to light after Constantine's dethronement, the existence of a definite understanding between William II, and Constantine to secure Greek neutrality in an impending European war has been expressly attested by Gen. Ludendorff himself in his war memoirs. During the first six months of the war Constantine gave no sign, even when Venizelos, before the first battle of the Marne, offered the alliance and aid of Greece to the Entente Powers. But when in Jan. 1915 the Entente promised Greece extensive territory in Asia Minor if she would join in the Dardanelles operations, and Venizelos proposed to co-operate, Constantine refused to give his sanction. Venizelos at once resigned, and at the ensuing parliamentary election a large Venizelist majority was returned (June 1915). The King was seriously ill at the time, and the Queen and the Government flatly refused to allow the appointment of a regent. Thus it was a full three months after the election before Venizelos
returned to power; during that interval every effort was vainly made by Court and Cabinet to seduce the Venizelists deputies into joining the “King's party,” as it was now openly termed. When Venizelos finally was reinstated in office Bulgaria was preparing to fall upon Serbia in the flank, and Venizelos hastened to inform Bulgaria that any attack by her upon Serbia would cause the intervention of the Greek army. But Constantine, sending for the Bulgarian minister behind Venizelos' back, authorized him to inform his Government confidentially that Bulgaria need not fear any intervention on Greece's part. He gave the same assurance through the channel of the German Government. Thus Bulgaria proceeded unhesitatingly to order a general mobilization (Sept. 1913). To this step Venizelos at once replied by ordering a general mobilization of the Greek army. The King offered no objection to signing the decree, but when the next day Venizelos announced in the Greek Chamber that Greece would declare war against Bulgaria if she attacked Serbia, Constantine immediately sent for him and asked for his resignation, informing him that he would never consent to attack one of Germany's allies. To Venizelos' remonstrance that after the recent popular verdict the Crown was bound to follow the responsible Government's policy, Constantine replied that in questions of foreign policy he did not hold himself bound to follow the popular will, as he considered himself "personally responsible to God alone." Thus, after Venizelos' fresh resignation and the formation of a Zaimes Cabinet, the Greco-Serbian treaty was repudiated and Serbia was abandoned to her fate. As the Venizelist parliamentary majority refused to support the new Government a fresh dissolution was decreed, and in the new election (Dec. 1913), owing to the Venizelist party abstaining as a protest against the repeated unconstitutional proceedings of the Crown, a new Chamber was elected, composed entirely of Constantine's supporters. At Venizelos' invitation just before his resignation an Anglo-French force of over 100,000 men had been landed at Salonika, too late indeed to save Serbia but strong enough to entrench itself at Salonika.

Constantine and his party did not yet dare to commit themselves to a policy of open hostility to the Entente, although the Greek army, mobilized by Venizelos to defend Serbia, remained under arms in Macedonia until July 1916 to "defend Greek neutrality." But the Allied army in Macedonia was subjected to every sort of petty annoyance and even to espionage on the part of the Greek authorities; thus a Greek lieutenant, who was accused of tapping the Allied military telephone wires, was ostentatiously decorated by the King within the week. On May 26 1916, by direct order of Gen. Kousmanes, the King's chief-of-staff, over the head of the responsible Minister of War, Fort Rupel, which commanded the Struma Pass into east Macedonia, was surrendered to the Bulgarians by pre-arrangement between Constantine and the German Government.

After Venizelos had seceded from Athens and established his "Provisional Government of National Defence" at Salonika, Constantine's movements became more and more openly hostile to the Entente. Regular communications with the Central Empires were kept up through north Epirus and Albania, and the German-Austrian submarines were suspected of receiving valuable assistance from royalist agents in Greece. Finally, Constantine's troops having become a standing menace to the Allied army in Macedonia, the Allies demanded the surrender of a quantity of arms and ammunition on the part of the Athens Government. The Lambros Ministry protested against this demand, but the King privately promised the French admiral, Dartige du Fournet, to surrender these arms if Athens were occupied by an Allied force to "save his face." When, however, on the following day (Dec. 1 1916) a body of 1,800 Allied blue-jackets landed at the Pireaus and marched up to Athens, they were allowed to walk into positions carefully ambushed, and there were set upon by the royalist troops and thousands of reservists specially enrolled and armed for the purpose overnight. The Allied force drew off at nightfall with heavy losses. They would have been annihilated but for the presence at Phaleron of a powerful Allied fleet, which late in the day hurled a few shells into the royal palace and caused Constantine to order a cessation of hostilities.

This act of treachery on Constantine's part was followed the next day by wild scenes of hunting down as rebels and enemies of the King the unarmed Venizelist citizens of Athens. But the Powers took no immediate steps either to protect their friends or to remove the threat to their flags. After a whole month of deliberation, on Dec. 31, they declared a blockade of Greece and demanded the removal of the entire Greek army to the Peloponnesus. But no measures were taken against Constantine himself, since apparently there were still quarters within the Entente unwilling to believe the worst. It was only on the downfall of the Tsar (March 1917) that Great Britain and France finally arrived at a decision. On June 11 1917 a powerful Anglo-French fleet arrived at the Pireaus, carrying a land force of 50,000 men; and M. Jonnart, in the name of the Allies, demanded the immediate abdication of Constantine and his eldest son and their departure from Greece. Constantine saw that resistance was hopeless and bowed to the inevitable. Constantine (or "Tino," as he was commonly called) withdrew to Switzerland; there, with the aid of the German propaganda, he organized intrigues in Greece among the disaffected. He went so far in 1918 as to send his chief aide-de-camp to Germany to select two officers of the Greek army corps of Kavalla, then interned at Görlitz, to proceed to Greece on board a German submarine, to spy upon the Allied army in Macedonia and to organize an armed uprising in their rear. And he openly proclaimed himself to be a supporter of Venizelos, the demand for whose extradition he had now renounced his rights to the Greek throne and was still the only legitimate sovereign, his son Alexander (who had been proclaimed the new king) being merely his temporary locum tenens. Thus it came about that upon Alexander's untimely death and Venizelos' defeat at the polls in Nov. 1920, Constantine returned in triumph to Athens, in defiance of the Allies' non-recognition of him. He was not recognized in 1921 by any of the Allied Powers. On June 11 1921 (still without any formal recognition from the Allies) he left for Smyrna to take command of the Greek army in Asia Minor in the renewal of war (England and France standing aloof) against Turkey.

**CONVOY** (see 7.69).—The system of convoy adopted by the British and American navies in 1917, by which merchant vessels sailed in organized groups under naval escort, played an important part in the World War. In the following account it should be noted that the term is used in the British Admiralty sense to signify not only the system but also the merchant ships under escort; in the U.S. navy the warships are the escort, the merchant ships the "train," and the whole is the convoy.

At the beginning of the war the British system of commerce protection was based on cruiser squadrons stationed at the focal points of the trade and routes to and from the British Empire. The newer tactics of commerce protection was the substitution of the cruiser by the convoy, a smaller warship to protect merchant vessels. Convoy protection was based on the choice of places where the enemy was not expected and known for the most part in areas to deal with enemy cruisers and raiders. Though it proved sufficient to accomplish the destruction of the "Kaiser Wilhelm der Grosse" and the "Cap Trafalgar," the principal cruiser raiders escaped its clutches; for the "Emden" was sunk by the "Sydney" escorting a convoy at the time, the "Karsruhe" was blown up by an internal explosion and the "Dresden" was sunk by a squadron detached for that purpose. From the first the system had been dislocated in every sea by demands for convoy, but by March 1915 the cruisers had been run to earth, and though raiders such as the "Mecreda" and the "Wolf" recurred, it was only occasionally and one at a time. The system of convoy was used in the case of the first large contingents of Australian and Canadian troops. The "Sydney" with the "Melbourne" and the Japanese cruiser "Ikuki," was escorting the Australian convoy across the Indian Ocean when she was detached to run the "Emden" down at Cocos I. on Nov. 9. The first Canadian contingent of 31,200 men which sailed from Quebec on Oct. 3 1914 in 31 transports was escorted by the cruisers "Charybdis," "Diana," "Eclipse" and "Talbot," reinforced, as they approached British shores, by the battle cruiser "Princess Royal" and the old battleship "Majestic." The system was

*These figures indicate the volume and page number of the previous article.*
The Comm. to approaching must circumvent number the Dover had W., other destroyers, Liverpool British shipping that convoy. The Admiralty and in the Grand Fleet, mission necessary at the time.

In March and April 1917, when the British losses in merchant shipping assumed alarming proportions, the idea of a convoy system came again to the front. Previous ocean convoys had been directed against the surface raider; it was the submarine that now formed the principal menace. The system was in use in the case of what was called the French coal trade, a cross-Channel traffic from Portsmouth and Falmouth performed by small ships, where it had worked very successfully, and it was now suggested to extend it to the ocean routes. The system of protection in routes on the average may be called the patrolled route system. There were three main approach routes to the British Isles, one N. of Ireland for ships making the Clyde or Liverpool by the North Channel (Route C); one S. of Ireland for ships making the British Channel and Liverpool by St. George's Channel (Route B); one towards the Scillies for ships making the English Channel (Route A). These were called the Tory I., Fastnet (S.W. point of Ireland) and Scillies approaches, from the lights sighted by the ships as they made the coast. These approaches may be regarded as three great triangles gradually narrowing to three apexes at or near the points mentioned. They were patrolled by warships and a sprinkling of destroyers, and when any area was threatened by submarine activity the routes in it were changed.

In March 1917, the system was slightly modified. Half a dozen different routes were specified in each approach triangle, and it was proposed to switch the traffic from one route to the other every five days. As the routes in each triangle could lie some 150 m. apart in long. 15° W., there was considerable scope for dispersion, and the system was in effect a system of protection by means of dispersion and routeling. The patrols were a mere precaution in routes on the average may be called the patrolled to patrol them in strength with two destroyers and 16 trawlers was impracticable. The scheme was in its essence an endeavour to circumvent the submarine by routeling and it failed. Its advocates could not possibly maintain that it was as efficient as an escort system, for all important ships were actually escorted, and it must be regarded merely as an attempt to burke the significance of the fact that was beginning to assert itself, that every ship had to be escorted.

The idea of general convoy met with strong opposition from every side—at the Admiralty, in the Grand Fleet and amongst the shipping. It was feared that ships would be crowded together would involve the creation of a new organization; the Grand Fleet saw its destroyers being taken away; very few recognized the fact that the battleships were now becoming merely complementary factors in a guerre de course. The policy of the fleet being ready at any moment to rush out and join battle still held sway. It was a policy resting chiefly on the basis of intelligence supplied by wireless directionals, which made it possible to know when the German fleet was at sea. It meant that the fleet had to be ready at any moment to put to sea in battle array, and in these circumstances the commander-in-chief Chung tenaciously to every one of his destroyers. These may be called the strategical objections to convoy, but other strong arguments could be urged against it. Ships would incur delay in assembling, instead of sailing direct; fast ships would incur further delay by having to reduce their speed to that of the convoy. Convoy meant congestion of ports on departure and arrival, and congestion of labour due to the simultaneous arrival of a number of ships. These objections were as old as the days of Duguy Trouin and Jean Bart, but there were other objections of a more modern type. The masters would never be able to keep station, and were at first much in favour of independent sailings.

On the other hand strong arguments could be marshalled in favour of convoy. Why string out 15 armed trawlers 10 m. apart to supply feeble protection on a line 150 m. long, when four destroyers attached to a convoy could give it continual and efficient protection over double the distance? It might appear at first that a convoy gave the submarine a massed target, but the danger of approaching it was greater, and submarine commanders would have to be more on the alert. In the way of a convoy system was the difficulty of finding the destroyers required for the escort. More than half the modern destroyers were absorbed by the Grand Fleet and the Harwich flotillas. In Feb. 1917 to were detached from the Grand Fleet to Devonport to assist in escorting important ships, and the use of armed trawlers was extended, but the latter were too slow and too ill-armed to be of much value.

The weekly returns issued by the trade division at this time conveyed a misleading idea of the situation. They gave the number of arrivals and departure of all nationalities, with the number of ships sailing from each port. The figures of figures had little to do with the real issue, for a small Dutch coaster making three voyages a week to France would figure six times in the arrivals and departures, which ran into several thousands, whereas the number of big ships arriving and leaving daily was very much less. The situation was much worse than it appeared, and the idea of general convoy gained ground.

In April 1917 the British had 3,534 ships over 1,600 tons, of which 1,125 were required for naval and military purposes, leaving only 2,409 available for civil purposes. There were not more than 15 patrols in each area of approach, and in March and April 1917 the number of ships passing through them was about 300, of which 24 were sunk, at which rate, giving each ship a round voyage of two months, practically one-half would have been sunk by the end of the year. Again those who argued in favour of the patrolled route system were arguing in direct opposition to their own policy, for escorts were always provided for all valuable munition ships and ships of national importance carrying Government cargo (some three or four a day in 1917). The patrolled route system was thereby acknowledged to be an inferior sort of makeshift for ships that were not of national importance. But in April 1917 it began to be seen that even the ship was of national importance, and that a loss of 273 ships a month meant that the navy would lose the war before the army could win it. The great advantage of the patrolled route system was that it gave much less trouble and required very few ships, but the same virtues were inherent in no system at all.

One other argument was marshalled against the system, namely, that it would be better to use destroyers directly against submarines. The reply was that no likelier spot could be chosen for seeking them than in the vicinity of a convoy, and from the date convoys commenced to run in May 1917 to the end of the war 15% of the number of ships passing through them was about 12% of the convoy in vicinity or when attacking convoys. The losses of April brought the question to an acute stage. The centralization of the control of shipping in the Ministry of Shipping facilitated the inauguration of a general system of convoy. On April 26 the director of the anti-submarine division urged its introduction, and on May 17 1917 a convoy committee was appointed to arrange the details of a specific scheme. The volume of trade in the Atlantic daily at that time amounted to about 400 vessels, of which 300 were British and 87 neutral. As the area of convoy only extended to about long. 26° W., only some 30 vessels had to be convoyed daily, and it was decided to start with a convoy from the United States and Canada every three days, from Gibraltar every four and from Dakar every five days. The initiation of the system fell largely to Comm. Reginald G.
Henderson, R.N., and its organization and business management to Paymaster-Capt. H. W. Manisty. The first homeward-bound Atlantic convoy started on May 24, and by June 1917 convoys were being regularly run.

The system may be considered under two heads: (1) the organization at the ports of assembly and at the Admiralty, (2) the system of command at sea and the tactical measures of the convoy and escort. At the ports of assembly, escorts had to be provided to conduct ships from the ports of loading and to the ports of discharge. The convoy had to be assembled, the masters mustered and given their instructions, and the convoy handed over to the commodore. This work was done by port convoy officers, who were appointed at home to Lamlash, Devonport, Falmouth and Milford Haven and abroad to Sydney (N.S.), New York, Halifax, Gibraltar and Dakar. At all points of any size, there were shipping intelligence officers who were now merged in the system and issued route instructions to the masters. At the British Admiralty the two principal tasks were assembly and routing. The general management of the system lay with the organizing manager of convoys (Paymaster-Capt. H. W. Manisty), who worked in close coordination with the shipping controller. In the task of routing he was assisted by naval officers and by a large convoy chart which showed continuously the latest movements of submarines and convoys. This chart was of the greatest value, for it made it possible to alter at once the course of a convoy if a submarine was reported in its vicinity, a system much more elastic and more exact than altering the routes blindly every five days. The three principal ports of assembly were Lamlash or Buncrana (Lough Swilly) in the N., Queenstown, Milford Haven and Falmouth in the S. Escorts were provided by the admirals commanding these areas, and orders for convoy were passed to them. An escort generally consisted of six to eight destroyers for a convoy of about 25 ships. A large portion of the work at Queenstown was gradually taken over by the U.S. Navy, who worked in the closest harmony with Vice-Adml. Sir Lewis Bailey, the local commander-in-chief. The whole question hinged on the provision of destroyers. In Feb. 1917 there were only 14 destroyers at Devonport and 12 sloops at Queenstown available for convoy, and it was estimated that 87 destroyers or sloops would be required to provide escort for homeward-bound convoys, and 44 additional destroyers or sloops for outward-bound convoys. It was here that the aftermath of Jutland was severely felt. For the Grand Fleet still had to be prepared to meet the German fleet again, and insisted on a minimum margin of destroyers to enable it to do so.

The destroyer position in 1917 is shown in the table (A = modern new destroyers and flotilla leaders; B = old destroyers).

Summary:—

- Grand Fleet and Harwich
- Dover, Nore, Portsmouth
- Convoy

It was not sufficiently appreciated that the adoption by the Germans of the strategy of la guerre de course would mean their abandonment of fleet operations on a large scale, and that the protection of Allied merchant shipping was now just as important as the defeat of the enemy's fleet. The command of the convoy at sea was vested in a "commodore of convoys," usually a captain or commander R.N. or R.N.R., who hoisted his broad pennant in the largest ship of the convoy and was attended by a small staff of signalmen. He took general charge of the convoy until it met the escort, when the commodore then took his instructions from the senior officer of the escort. A considerable equipment had to be provided for each convoy, including fog buoys, masthead angle tables, station-keeping instruments, and signalling lanterns. A convoy usually consisted of 25 to 32 ships. They were organized in five or six columns with ships 500 yd. and columns 800 yd. apart. The proportion at a later date was eight destroyers to a convoy of 22 ships and six to a convoy of less than 16.

The convoy came across by itself and was met by the escort on approaching the submarine zone, some 500 m. out at sea, and brought in by it. In daylight or in suspected areas or on a submarine report the whole convoy zigzagged, an operation which consisted in an alteration of one or two points (11° to 22°) on each side of the navigator's course (course of advance) for some 10 minutes. These alterations of course were intended to make it more difficult for the enemy to estimate the exact course of the ship, a necessary factor in adjusting the sights for firing a homeward-bound convoy. Another protective element was the system of camouflaging ships, which rendered it more difficult to distinguish the fore and aft line of a vessel, a necessary preliminary in estimating its course (see Camouflage: Naval).

The first convoys in May 1917 were all homeward-bound to Great Britain, but by Aug. outward-bound convoys were running too. The main designation of convoys was into H. and O. (homeward and outward), with subsidiary letters indicating the port of departure and a series number for each convoy.

The principal convoys were as follows:—

<table>

By the end of Oct. 1917, 99 homeward convoys had come in comprising 1,502 steamers with a loss of 10 vessels sunk in convoy and 14 after dispersion, giving a total loss of 24 or 1·57 per cent. By the end of Nov., 77 outward convoys had gone out, with a loss of 0·57 per cent.

The time lost by fast ships remained a distinct disadvantage of the convoy system. In a voyage of 3,200 m. the time lost in waiting at ports of assembly (24 hours) and through slow travelling (133 hours) amounted to 157 hours or six and a half days, for a steamer of 5,000 tons. This was eventually diminished by the institution of fast and slow convoys, but on the other hand there were certain advantages which tended to compensate for the delay. Ships did not have to call anywhere for orders, and they were not affected by suspension of traffic, which often held up independent sailings.

The introduction of the convoy system had the effect of forcing the German submarines to attack nearer the shore. In
the early months of the year the crosses indicating ships sunk had been scattered all over the seas W. and S.W. of Ireland. They were now confined to coastal areas, which greatly facilitated the work of rescue and salvage. From Sept. to Dec. 1917, only six ships were lost over 50 m. from land, which meant a great reduction in casualties, with corresponding increase of confidence in convoyed ships. The homeward-bound convoys were also given what were called ocean escorts of armoured cruisers or armed merchantmen, who accompanied them the whole way. By Sept. 1917, Atlantic convoys were in regular operation with about 150 vessels coming in and the same number going out weekly. The destroyers which took the outward-bound convoy out, met the homeward-bound convoy and brought it in, though this procedure often led to delays and difficulties in bad weather, darkness and fog. The bulk of the Atlantic work in European waters was done by British craft, Great Britain providing 70% of the destroyers for convoy and the United States 27 per cent.

On the E. coast of Great Britain, matters followed a rather different course. A conference had been held at Longhope (Scapa Flow, Orkneys) on April 4, 1917, under the vice-adml. of the Orkneys and Shetland (Sir Frederick Brock), and it had been decided to convoy Scandinavian ships, on whom Great Britain was dependent for much of its imported wood pulp. They came up from Hull to Lerwick, where an escort of two destroyers and four to six trawlers took them across. This route was much more exposed to attack by surface craft than the Atlantic route, for it was only some 350 m. from Horns Reef, a distance which could easily be covered by a fast cruiser in 15 hours of darkness. Such attacks were the natural counterstroke to a convoy system, and it was one of the principal functions of the fleet to screen convoys from them. The first attack of this sort took place on Oct. 17, 1917, when the “Brummer” and “Bremse,” two fast German cruisers, originally designed as minelayers for the Russian navy, attacked a Scandinavian convoy of 12 ships, and sank the two destroyer escorts, the “Mary Rose” and “Strongbow,” and all but three of the convoy. A considerable force of light cruisers (comprising some 16 vessels) was in the vicinity, but as it was not close to the convoy, and the wireless installation of the escorts was destroyed by the first salvo, the enemy got away.

This was a severe blow to the E. coast convoy system and as a remedy it was proposed to provide a stronger covering force from the Grand Fleet. This entailed the reduction of convoys to three a week, the use of the Tyne instead of Humber as an assembly port, and the provision of nine modern destroyers. The commander-in-chief of the Grand Fleet demurred at the provision of destroyers, and at a conference on Dec. 10, 1917, it was decided to use Methil, a small port on the Fifeshire coast of the Firth of Forth, as an assembly port. The decision had hardly been reached when two days later, on Dec. 12, the convoys were again attacked. The German attack was made on this occasion by two half-torpedo flotillas (five boats each). The third half flotilla went N., and meeting heavy weather made Udeshire on the Norwegian coast at 7 A.M. on the 13th. Steaming down the coast, the flotilla sighted at 12:30 P.M. a convoy of six steamers from Lerwick to Norway, escorted by the destroyers “Pellew” and “Partridge” and four armed trawlers. The “Partridge” received a shot in her main steam pipe, and after hitting a German destroyer, Vico, with a torpedo which did not explode, was sunk. The “Pellew” escaped home. She was sunk, and the half flotilla returned home round the Skaw. Two armoured cruisers, the “Shannon” and “Minotaur,” were acting as a covering force, but were again too far off, and though they hurried to the spot on receipt of a wireless message arrived too late. Here can be seen a distinct divergence of opinion and method between the conduct of the Atlantic and Scandinavian convoys. An escort against surface craft should be at least within sight of a convoy, and a covering force against an attack in force is of little use if it is not within reinforcing distance. At the root of the insufficient protection accorded to the Scandinavian convoys was the policy prevailing both at Whitehall and at sea that the Grand Fleet must be ready at any moment to sail for the Bight and bring the enemy to action. This naturally led to convoy work being regarded as an entirely subsidiary task. In April 1918, the German admiral Scheer made a bold sortie in force against the convoy. The whole fleet put to sea on April 23 for the Norwegian coast. In front was Adml. von Hipper with the battle cruisers of the first scouting division, and Scheer followed with the battlecruiser. The time was ill-chosen. One convoy of 34 ships was just entering the Forth, and another of 47 ships leaving it, while the British and Barque were protected by 7th Light Cruiser Squadron at sea covering them. This was the last sortie of the German fleet, and it is interesting to note that it was directed against the convoy system. It led on the British side to the convoy route being shifted to the northward, so as to remove it farther from the source of attack and increase the chance of striking a counter-blow. In 1917 the two armoured cruisers H.M.S. “Leviathan” and “King Alfred” were attached to convoys, and in 1918 a U.S. pre-dreadnought battleship was added. The possibility of an attack by battle cruisers was met by a U.S. dreadnought force being stationed at Bere Haven in Sept. 1918 to be available to meet convoys coming in, and in Oct. 1918 it actually put to sea for this purpose. Convoy was extended to 8,000, and by the end of the year the total number of ships convoyed reached 88,000, with a loss of 436 ships or approximately 0.5 per cent.

The Mediterranean had always been a difficult area, and the institution of convoys in that sea followed a somewhat different course. Operations in that sea were greatly influenced by the fact that the Mediterranean outside the Adriatic was under French naval control, and the French commander-in-chief, Vice-Adml. Gauchet, would have assumed command in the event of the Austrian fleet breaking out. However, with the consent of the French and Italian naval authorities, a British commander-in-chief, Vice-Adml. Sir Somerset Gough-Calthorpe, was appointed in Aug. 1917 with the special charge of arrangements for the protection of trade and anti-submarine operations. The divided control, and the different patrol areas under different nationalities, did not make for efficiency, but the general arrangements were settled by a conference of Allied officers at Malta (Commission de Malte), with delegates from France, Italy and Japan. In the Mediterranean, as at home, the question hinged on destroyers. The Italians preferred to retain their destroyer forces in the Adriatic and on their own coastal routes, just as the British commander-in-chief wanted to retain them with the Grand Fleet. When the British destroyers available (about 30), some eight were required to watch the Dardanelles.
and the Aegean, and operations on the Syrian coast engaged the services of a few more. The Japanese cooperated heartily; their 14 destroyers did yeoman service, and during 1918 the system was entirely dependent on them for the escort of troop transports. The general allocation of British escorting craft in that area in Oct. 1917 was as follows:—

It will be seen that sloops played an important part in the convoy system in the Mediterranean, and as they could not make the voyage from Gibraltar to Port Said without refuelling, it was necessary to provide complete reliefs for the escorts of O.E. and H.E. convoys as they passed Malta. This involved a severe strain on the convoy system, though it was eased later by the addition of some patrol gunboats.

The control of the escorts was at first under a British admiral of patrols, with patrol commanders acting for him at the various ports, who arranged for the formation of convoys and issued route instructions and sailing orders. The principal convoys were the Bizerta-Alexandria (British), Bizerta to Malta (British), Marseilles to Bizerta (French), Marseilles to Algiers (French), Milo (Aegean) to Alexandria (Br. and Fr.), with fast through convoys between the United Kingdom and Port Said under British escort. The system of patrols was retained by the French for a time on the Algerian coast, and the losses there were heavy. The defects which had existed at British home ports exhibited themselves abroad. The staff work was defective; intelligence was not freely and quickly distributed, and action was not taken on it. This led on March 20 1918 to a convoy running right into an area N. of Alexandria where warning had been given of the presence of a submarine waiting for it, with the result that four ships of the convoy were lost.

The Mediterranean remained one of the worst areas for losses. In May 1917, 14 British ships had gone down in the Channel and 11 in the Mediterranean. The losses in the Channel had been stopped by the Dover barrage and Rear-Adm. Roger Keyes; and the First Lord (Sir Eric Geddes) and the Director of Naval Intelligence now proceeded in person to the Mediterranean to consult with the commander-in-chief there and make arrangements for a complete reorganisation of his staff. The admiral of patrols was abolished, and a director of shipping movements instituted. Wireless directional stations were established at suitable points, and the losses were reduced to a reasonable figure. In Nov. 1917, 381 sailed in convoy in the Mediterranean, with a loss of nine or 2.35 per cent. In Sept. 1918, 979 ships sailed in convoy with a loss of eight or c.82 per cent.

Troop movements were one of the most important branches of the convoy system, and it is interesting in this connexion to note the total numbers moved by sea during the war, which amounted to 22,144,000 from Aug. 9 1914 to Sept. 28 1918, made up as follows:—

**Troops moved by sea, Aug. 1914 to Oct. 1918.**

| Cross Channel to France | 15,576,107 |
| From U.K. to Medit., India, Persian Gulf, Russia | 938,562 |
| From North America | 1,334,173 |
| From Australia | 391,043 |
| In Mediterranean, less 350,000 included above | 1,035,926 |
| Between India and Egypt | 1,500,204 |
| Various | 1,010,561 |
| Total | 22,144,759 |

In the English Channel most of the work in 1917 was being done by small fast packet-boats, of which there were 16 on the Southampton-Havre route and eight on the Folkstone to Boulogne. During 1915 the average daily number of transports from Southampton was three to four, and the daily average requiring escorts was five to six in 1918. Of loaded troop and ambulance transports only two were sunk, the “Donegal” on April 17 1917, from Southampton to Havre, with 600 troops and 38 casualties, and the ambulance transport “Warilda” on Aug. 3 1918, from Havre to Southampton, with 25 casualties. The Folkestone to Boulogne route was controlled by the vice-admiral at Dover. Here the principal danger was mines. Vessels crossed only in daylight, and from two hours after to three hours before high-water. The average daily number of transports in the latter part of 1917 and 1918 was some half-dozen in each direction. In the last five months of the war the average daily troop traffic in the Channel was 11,254, viz. 5,700 at Southampton, 3,700 at Folkestone and 2,500 at Dover. The number of troops moved by fast steam-packet vessels in the Channel was enormous, and cannot have been much less than 12 millions, with casualties of less than 1,000. At Dover in the latter part of 1917 three to four destroyers and three to four P. boats were usually employed in cross-Channel escort work.

On the Atlantic route fast troop convoys came into use in April 1918, and during 1918 (up to Nov.) 5,037,000 men came over in them. Three large transports, the “Olympic” (25 knots), “Mauretania” (25 knots), and “Aquitania” (24 knots), also worked singly and independently, with escorts of three or four destroyers to bring them in and take them out. The “Olympic” was attacked on several occasions, but never successfully, and in May 1918 it rammed and sank a submarine (U303). Only three transports were lost on the Atlantic route, the “Tuscana” with 2,400 U.S. troops, torpedoed and sunk seven m. N. of Rathlin Is. on May 2 1918 with a loss of 212 troops, the armed merchant steamer “Moldavia,” escorting HC1 and carrying troops, torpedoed and sunk in the English Channel on May 23 1918 with a loss of 64 troops, and the “Orlando,” escort to HX50, wrecked on the coast of Islay after collision on Oct. 6 1918, with a loss of 362 troops. The total loss of troops was 537. The losses in the Mediterranean were much heavier, and three-fourths of the troopships sunk went down there though only 10% of troop movements took place in that sea. Submarines worked there under specially favourable circumstances, while the narrow waters gave little opportunity of altering the routes to any great extent. In 1915 some 330,000 troops were conveyed in 242 transports, all of which arrived safely except three—the “Royal Edward,” torpedoed and sunk on 13/8/15 in the Aegean with a loss of 865 troops, the “Ramanaz,” in the Aegean on 19/9/15 with a loss of 11 troops, the “Marquette” approaching Salonika on 23/10/15 with a loss of 128 troops. In 1916, 220,000 troops were conveyed in 143 transports, all of which arrived safely.

During 1917 and 1918 the troop movements were principally to Salonika, Egypt and Syria, and 14 transports were lost as follows:—

**Losses.**

1917: “Ivernia,” Marseilles to Egypt, 1/1/17, off C. Matarpan 120
“Georgia,” Alex. to Salonika, 8/3/17, off C. Sidero 33
“Cameronian,” Marseilles to Bassa, 15/4/17, 150 m. E. of Malta 223
“Arcadian,” Sal. to Egypt, 15/4/17, off Milo. 279
“Transylvania,” Mars. to Egypt, 4/5/17, Gulf of Genoa 434
“Cameronian,” (French service), 2/6/17, off Alexandria 63
“Aragon,” Mars. to Egypt, 30/12/17, off Alexandria 426
“Osmanieh,” Taranto to Alex., 31/12/17, off Alexandria 225
1918: “Kingstonian,” Alex. to Mars., 11/4/18 9
“Ornith,” 12/5/18, off C. Spartivento 1
“Leasowe Castle,” 26/5/18, 104 m. from Alexandria 99
“Mississ,” 29/5/18, 80 m. from Alexandria 44
“Hyperia,” 28/7/18, 84 m. from Port Said 32
“Anhil,” 12/8/18, off Cyprus 4

There was thus a total loss in the Mediterranean of 17 transports and some 3,036 troops. It will be seen that the total loss of transports was about 20, with a loss of some 4,563 troops, or about one in 5,000, of which 60% occurred in the Mediterranean.
The numbers of vessels which sailed in British convoy from July 1917 to Oct. 1918 were:

CONWAY, SIR WILLIAM MARTIN (1856— ), English traveller and man of letters (see 7.69), was elected Coalition Unionist M.P. for the minor (grouped) English universities in 1918. In 1917 he was made director-general of the projected Imperial War Museum, the organization of which he helped to found, his energies, with the result of a large exhibition of the collections towards it being opened at the Crystal Palace in 1920. Amongst his later publications were The Sport of Collecting (1914), The Crowd in Peace and War (1915) and Mountain Memories (1920).

COOK, SIR EDWARD TYAS (1857-1919), English journalist and man of letters, was born at Brighton May 12 1857 and educated at Winchester and New College, Oxford. Whilst at Oxford he was president of the Union and of the Palmerston club and, on coming to London as secretary for the extension of university teaching, he became a contributor to the Pall Mall Gazette; then under the editorship of John Morley. He was later assistant editor under W. T. Stead and editor from 1890 till 1892, when the paper passed into the hands of Mr. W. W. (afterwards Lord) Astor and changed its politics. Cook then resigned, but a year later became first editor of the newly founded liberal evening paper, the Westminster Gazette. In 1896 he gave this up to take the editorship of the Daily News, which he held till 1901. During the World War, conjointly with Sir Frank Swettenham, he directed the official Press Bureau. He was knighted in 1912, and created K.B.E. in 1917 on the inauguration of the Order of the British Empire. He was a lover of art and of gardening. He published Studies in Ruskin (1891), edited the works of Ruskin (1903-7), and wrote the authoritative Life of Ruskin (1912), also producing handbooks to the National Gallery and the Tate Gallery, and to the Greek and Roman antiquities in the British Museum. His book on The Rights and Wrongs of the Transvaal War ran into several editions, and he wrote Life of Florence Nightingale (1913) and Delane of the Times (1913), as well as two volumes of Literary Recollections (1918 and 1919).

He died at South Stoke, Goring, Sept. 30 1910.

COOK, SIR JOSEPH (1860— ), Australian politician, was born at Silverdale, Staffs., and at the age of nine started life in a coal-mine. In 1884 he went to Australia and six years later entered the N.S.W. Legislature, holding office as Postmaster-General 1894-8 and Minister of Mines and Agriculture 1898-9. He was elected to the Commonwealth Parliament for Parramatta as a Free Trader in 1901 and became Minister for Defence under Mr. Deakin 1909-10. In 1913 he formed a Liberal Cabinet after the defeat of the Labour party; but just before the outbreak of the World War, the governor-general decided to appeal to the country and as a result of the elections Mr. Fisher assumed the premiership. In 1914 Cook, before vacating office, had placed the Australian fleet units at the disposal of the British Admiralty. He did not take office again until 1917 when he was Minister for the Navy in Mr. Hughes's second Ministry. The following year he was created G.C.M.G., having in 1914 been sworn of the Privy Council.

COOLIDGE, CALVIN (1872— ), American statesman, was born at Plymouth, Vt., July 4 1873. After graduating from Amherst in 1895 he studied law in an office at Northampton, Mass. Here he began to practise in 1897 and soon became prominent in local affairs. After serving as city clerk, city councillor, and city solicitor successively, he was elected in 1907 a member of the General Court, or House of Representatives, of Mass. He was mayor of Northampton, 1910-11, and sat in the state Senate from 1912 to 1915, being its president during his last year. He became lieutenant-governor of Massachusetts in 1916 and was reelected in 1917 and 1918. He was elected governor of Massachusetts in 1919 and in 1920 was reelected under circumstances that attracted nation-wide attention. He had dealt summarily with the striking policemen in Boston Sept. 1919, refusing to reconstitute them. In the following gubernatorial campaign this was made an issue by his Democratic opponent, who appealed to those in sympathy with the strikers. The results vindicated the governor's action; he obtained a majority of 114,000 votes (out of a total of 510,000). Already in April 1919, during a strike of telephone operators in Boston, he had proposed that the state take over the lines, but the trouble was soon settled. That he was not opposed to labour was shown by his earlier support of the bill limiting the scope of injunctions against striking employees.

In June 1919 he vetoed the bill for increasing the pay of members of the Mass. House, arguing that their service was optional and not a means of livelihood; it was public service and should not be made a job. As governor he recommended that Massachusetts ratify the woman-suffrage amendment to the Federal Constitution. In 1920 he vetoed a bill calling for censorship of moving pictures and likewise a bill to permit the sale of "2-75 per cent" beer. The latter he declared would be "hypocritical legislation" because, with a Federal law on the statute book forbidding beer with an alcoholic content of over one-half of 1%, it would still not be possible to sell 2-75% beer in Massachusetts. At the Republican National Convention in 1920 he received a few votes on all ten ballots for president. When the voting for vice-president began his victory was at once apparent and he was nominated by acclamation. He was elected in Nov. on the ticket with Warren G. Harding by an overwhelming vote.

Some of his speeches were published under the title Have Faith in Massachusetts (1919).

COOPER, SIR RICHARD POWELL, 1st BART. (1847-1913), English agriculturist, was born Sept. 21 1847. He became a member of the firm of Cooper & Nephews, chemical manufacturers and exporters of pedigree live stock, and achieved a great reputation as a breeder of shorthorn cattle and Shropshire sheep. He rendered great service to the Argentine Republic by supplying it with British live stock. He died at Berkhampstead July 30 1913, being succeeded as 2nd Bart. by his son Richard (b. 1874), M.P. for Walsall from 1910.

COÖPERATION (see 7.82).—The term "coöperation" covered in 1921 a large number of forms of economic organization which had little resemblance except that of name. In considering their development since about 1907, it is necessary to deal with each type separately. Coöperative organizations may be conveniently classified under four main heads:—consumers' coöperation, industrial producers' coöperation, coöperative credit and banking, agricultural coöperation.

Consumers' Coöperation.—The British coöperative movement, though it contains producers' societies, is in fact almost synonymous with consumers' coöperation. Of 1,459 societies affiliated to the Coöperative Union in 1919, 1,337 were consumers' societies and 95 producers' societies; the membership of the consumers' societies was 4,131,477 and their trade over £314,000,000, while in the producers' societies the membership was 35,331 and the trade £7,000,000.

The growth of the movement between 1906 and 1920 was very remarkable. The membership of retail societies rose from 2,250,000 to over 4,000,000, their capital from £33,000,000 to nearly £80,000,000, and their sales from £63,000,000 to £108,000,000. The significance of these figures is not merely that this vast industrial system has been built up and managed by the working classes of the United Kingdom, but also that in 1921 between one-third and one-fourth of the population of the United Kingdom consumed commodities manufactured or distributed under this coöperative industrial system, a system which eliminates profit-making and implies democratic control of industry.
by the community of consumers. And it was now no longer true to say that the movement flourished mainly in the industrial districts of the North and Midlands; London, for instance, which for long had the reputation of being a "cooperative desert," had become an active centre of cooperation, and the London Co-operative Society, recently formed by an amalgamation of two former societies, was now the largest cooperative society in the kingdom and had a membership of nearly 100,000 and annual sales of nearly £3,500,000.

But if the expansion of the distributive side of the movement in the local societies had been great, the growth of production and manufacture by consumers' societies was even more remarkable. Nearly all the retail consumers' societies are federated in the English, Scottish, and Irish wholesale societies for the purposes of manufacture and wholesale supply. The value of the goods supplied by these wholesale societies to their members amounted in 1919 to £15,000,000. The outstanding feature in the history of 1919-20 was the way in which the wholesale societies, particularly the English C.W.S., proved that the system of consumers' cooperation could be adapted to control the various branches of industrial production. The English C.W.S. is one of the most important and varied industrial businesses in the world. Its employees number about 40,000; in 1919, apart from its activities as a wholesale supplier and distributer, it produced or manufactured for its members commodities valued at over £25,000,000. It was in 1921 the largest flour miller in the United Kingdom and probably the largest timber importer at the Manchester docks. Its factories are to be found in every large industrial centre. It produces boots and shoes, textiles and clothing, furniture, metals and hardware, soap and candles, tobacco and groceries. The most significant feature in the development of the productive activities of the consumers' societies is the way in which circumstances have compelled the C.W.S. to obtain control over the raw materials necessary to the production of goods consumed by cooperators. The supply of a staple article like bread will afford a good example of this tendency. The baking of these breads in the earliest times was a successful cooperative industry and a branch of the activities hitherto described. But consumers, however, soon found that baking was only the last link in a whole chain of industries which determined the price and quality of bread. In order that the community of consumers might really exercise control over that price and quality, the movement was driven back-wards from the baking industry to enter the milling industry. Though the C.W.S. has become the biggest miller in the kingdom, and the value of the produce of the corn-milling industry of the movement was nearly £13,000,000 in 1919, events at the beginning of the World War taught co-operatives the weakness of their position unless they also had some control over the production and supply of grain. They turned hence into flour in their mills. In the early days of the World War the movement stood out against "profiteering" in bread and flour, and there were several instances of societies which succeeded in keeping down the price of bread in their areas by refusing to purchase from other bakers. But co-operatives had no such power of influencing the price of wheat upon which depended the price of flour, because they depended too much upon the private wheat-grower for their supplies. These considerations induced the C.W.S. to acquire 10,000 acres of wheat-growing land in Canada.

There are other equally remarkable examples of the same tendency. In 1914 the C.W.S. had hardly touched agriculture; in 1921 it owned nearly 35,000 acres of land in the United Kingdom, and in a single quarter of 1920 it started a cattle market at Liverpool, a butter factory at Carlisle, and a fish-landing station at Fleetwood. Again, since the beginning of the war, English and Scottish wholesale societies have become really large owners of tea estates; during 1920 they purchased no less than 32,000 acres in the Indian and Ceylon. Lastly, the same principles may be observed in the soap and candle industry, for in 1921 the C.W.S. at its depots in West Africa purchased palm kernels direct from the natives, shipped them to its oil mills in Liverpool, which again refined them and supplied cooperatives in the form of soap and candle factory at Ilfracombe, materials of other industries.

Cooperative industry, based upon a democratic organization of consumers, spread in the decade 1910-20 from town to town and from industry to industry throughout the economic system of Great Britain, but perhaps one of its most interesting and important developments was in the sphere of international trade. In one sense the co-operative movement, as a large importer of food, raw materials, and manufactured goods, had always engaged in foreign trade, but as an importer there was nothing to distinguish its activities from those of the ordinary private trader or joint-stock company. But the C.W.S. has shown since the war what great possibilities there are in the movement for conducting international exchange of goods on a non-profit-making, cooperative basis. Cooperative international trade implies, of course, that there should be a direct exchange of goods between the organized co-operative movements of the several countries; but this trade is facilitated by the co-operative movement by the payment of dividend upon purchase. The machinery for such trade already exists, for no fewer than 19 European countries possess cooperative wholesale societies, and these wholesale societies can organize international trade with one another on a strictly cooperative basis.

To some extent this kind of trade had existed for many years; before the war, for instance, the English C.W.S. supplied tea to the German wholesale society, and imported German linseed meal into this wholesale society, while the German wholesale, again, supplied goods to the Danish wholesale. But the economic situation at the end of the war gave a great impetus to international cooperative trade. The ordinary machinery of foreign trade had broken down as the result of war and blockade, and it would not right itself, partly because of the chaos in credit and the exchanges, and partly because the new conditions of production and distribution in effect, were not under the same disadvantages as capitalist enterprises.

The English C.W.S. took the lead in organizing international exchange, and it did so in three different ways. It supplied goods to the cooperative societies of foreign countries; it supplied countries, such as the Netherlands, Norway, Brazil, China, and India, which itself purchased; and it acquired foreign investments, the greater part of these credits being taken in the form of food and manufactured goods. Thirdly, it tried the experiment of direct barter with the co-operators of South Russia, sending a cargo of grain in exchange for a cargo of flour. This experiment was a great success; the C.W.S. had no difficulty in disposing of its goods, and was able to acquire wheat in exchange a cargo of raw materials. This experiment in cooperative barter was not very successful, partly owing to political difficulties, but the other enterprises led to an international movement among co-operatives to establish a system of barter, and three years after the war such a system had been started. The cooperative movement in the several countries, and a scheme was agreed upon under which each wholesale society would organize an export department, there would be joint purchasing arrangements between the various societies, and there would be a central bureau of statistics for the collection of information regarding goods which each wholesale society either demands or can supply. Two other developments of the cooperative movement deserve notice. The first is insurance. The Cooperative Insurance Society, which is a joint insurance department of the English and Scottish wholesale societies, now underwrites life, fire, accident, and marine insurance, and has already acquired a large extension of business, showing a rapid development in recent years. The most interesting feature is the collective life assurance business, under which a cooperative movement of a national character now exists. The most prominent feature of this system is a great saving in cost, for there is no collection of premiums from individuals, the premiums being paid in a lump sum by the society and recovered from the dividend payable to members. In 1919 there were 877 societies assured in this way, and the number of members in these societies was 21 millions. This insurance business is conducted on strictly cooperative principles; thus out of the profits on fire insurance, after the usual rate of 5% on capital was paid, a dividend of 2% was returned to members and 1% to non-members upon their fire insurance policies was declared in 1918. The progress of cooperative insurance may be seen in the fact that from £60,157 in premiums in 1921 to £242,066 in 1919, an increase of 785 per cent. The C.W.S.'s general activities have made equal progress. The C.W.S. Bank has (1921) two branches, one in London and the other in Manchester. It has 746 members and a capital of over £260,000 allowed to it by insurance societies, friendly societies, clubs and other mutual organizations. In 1920 the number of current accounts with the bank was as follows: cooperative societies 1,016, trade unions and friendly societies 7,462, other clubs, etc., 12,860. The half year ending June 1920, amounted to £314,000,000, showing an increase of over 26% on the corresponding period of 1919. The facts and figures given above show the tremendous growth of the cooperative movement. The increase in its membership and the great extension in the area of its operations have brought new problems and created new tendencies. To the end of the
19th century the movement was content to proceed on its way of steady development in a certain amount of obscurity. This is no longer the case: cooperators have begun to claim the place to which their numbers and operations entitle them in the economic life of the country. These claims can be stated shortly as follows: Consumers’ cooperation is a system which ensures a democratic control of industry by the community organized as consumers. Every consumer can join a society and every member has one vote and can, if he cares to do so, exercise an equal power of control over the conduct of industry. The dividend on purchase ensures that commodities are supplied to consumers at cost price and that, therefore, profit is eliminated. Under cooperation production and the various spheres of industry from banking to insurance, from the production of raw materials to the marketing of manufactured articles across the counter of the shop or store, are all carried on for none and not for profit. This system has already shown that it can adapt itself to one economic sphere after another and there is no reason to suppose that the scope and range of cooperative industry are not capable of almost indefinite extension. The movement, with its 4 million members, already represents from 12 to 15 million consumers or more than one-quarter of the population, and consumers’ cooperation is now, in fact, an alternative to the ordinary capitalist system of controlling industry.

These claims and ideals are being put forward and are undoubtedly having an effect upon the development of the movement. They are not held consciously by the vast mass of the 4 million members, but they are slowly penetrating the movement, largely owing to the educational work of the societies and the Co-operative Union and also of a very active and influential cooperative organization, the Women’s Co-operative Guild, which has a membership of nearly 50,000 women members of cooperative societies.

The increase in cooperative activity and in the consciousness among cooperators of the importance and capacities of their movement are partly the effects of the war. It might have been expected that the dislocation in manufacture, trade, and the difficulties of food supply would have had an adverse effect upon a working-class movement like the cooperative movement. The facts show that the reverse was the case. The membership of retail societies, for instance, rose from 3,054,000 in 1914 to 4,131,000 in 1919, an increase of 35%, while the increase from 1909 to 1914 was only 24%. This increased rate of growth was partly due to the rise in prices and the popular irritation against “profiteering,” for the elimination of profit-making and the dividend on purchase tend to keep prices down in the co-operative store and make “profiteering” impossible.

Reference has also been made above to the way in which circumstances connected with the war led to an extension of the productive and distributive activities of the C.W.S. But the war had another effect upon British cooperators: rightly or wrongly there grew up in the movement a widespread conviction that it was being victimized in the interests of private traders. Definite complaints were made of unfair treatment of cooperative societies and their staffs by military service tribunals and of discrimination against cooperative organizations in the allocation of Government-controlled supplies. The decision of the British Government to tax cooperative societies by means of the Corporation Profits Tax brought the dissatisfaction stated by the members to a head. The argument was freely used that the movement, in order to protect itself against political action, must “enter politics.” In 1917 the whole question was discussed at the Co-operative Congress, and a resolution was passed that the movement should enter politics and nominate candidates in constituencies as an independent unit, but that it might work with other organizations having similar aims and objects. Several cooperative candidates stood in the general election of 1918 and one was elected. The Co-operative party was still in its infancy in 1921 and any estimate of its future was impossible. One feature of the tendency which it represented must, however, be noted. There was a considerable body of feeling in the movement which held that the Co-operative party should unite with the Labour party and trades union movement to form a “Labour and Co-operative Political Alliance.” On the other hand a large number of cooperators were not prepared to accept this proposal. The whole scheme for such an alliance was in 1921 still under discussion in the movement.

Another problem—which has assumed great importance in recent years for cooperators is their relations to their employees. In 1919 the consumers’ societies employed about 175,000 persons, of whom about four-sevenths were employed in distribution and three-sevenths in production; the wages and salaries paid to these employees amounted to about £20,000,000 a year. The relations between the movement and its employees have been complicated until recent years by a misunderstanding as to the nature of consumers’ cooperation. Cooperators themselves did not distinguish clearly between the control of industry by the community organized as consumers for use and not for profit (consumers’ cooperation) and the control of industry by the workers or producers in self-governing workshops or factories in which the profits were divided among the workers (producers’ cooperation). Hence arose a certain school within the consumers’ movement which held that the employees of consumers’ societies should share in the “profits,” although the dividend on purchase eliminates “profits” in the sense in which a joint stock company or a self-governing workshop makes a profit. The illogicity of this position was, however, gradually realized, and in 1921 very few societies paid the bonus on wages by which the cooperative employee was given a “share in profits.”

The cooperative employee was therefore recognized to be merely a wage-earning employee of the democracy of consumers. But the movement, as a large employer of labour, was brought face to face with many new problems. As an employer it stood in a peculiar position. It was composed mainly of the manual wage-earning class, and a very large number of its members were naturally trade unionists. It always professed to pay good wages and to give the best possible conditions of employment. But it was competing with the businesses and factories of the ordinary capitalist; it was not, in so far as it was a joint stock company, and the trade and industry would soon be killed out if wages and conditions of employment within the movement were such as to raise the cost of production substantially above that of its rivals. Most people agree that on the whole the conditions of the cooperative employee compared very favourably with those of employees of private firms and companies, although there were still societies in which wages, etc., were bad. The movement had, however, increasing difficulties with organized labour.

Up to 1920 large numbers of cooperative employees were organized in a special trade union, the Amalgamated Union of Cooperative Employees (membership in 1920, 90,000). This union was founded in 1891, and it throws some light upon its original relations with the cooperative employer that in the original rules there was no provision for strikes. But this happy situation could not and did not continue. The presence of large numbers of trade unionists within the movement means that any demand for increased wages will probably receive some support within a society. There is no doubt that organized labour to some extent took advantage of this fact: a demand for increased wages or shorter hours was often first made upon cooperative societies, and it was then that the cooperative empleado used the advantage of law to give way, labour could then go to non-co-operative employers and demand that they should pay the same wages or give the same conditions as cooperators.

These facts and conditions gradually led to strained relations between the movement and its organized employees. As a whole the movement stood as strongly for trade union recognition and for the payment of trade union rates of wages as the trade unions themselves, indeed several societies insisted that their employees should be members of their unions. There had also been for long in existence joint machinery of the movement and the unions for settling industrial disputes by conciliation and arbitration; but for various reasons this machinery did not work satisfactorily, and in 1911 the Amalgamated Union of Cooperative Employees began a more militant policy and made provision for a strike
fund. Since that time there have been several strikes against cooperative societies. The whole question of the relation between the cooperative democracy and its employees has been raised by these events, and in 1921 it remained unsettled. It was complicated by the demand among certain sections of labour for workers' control of industry. Many co-operators believed that the workers should be given some share in control, i.e. that they should share with the consumer in the determination of rates of wages and conditions of employment. This was a part of the principle of consumers' co-operation, control of industry by the community of consumers for the use of the community, is inconsistent with the complete control either of individual factories and workshops or of whole industries by the organized workers, the principle of producers' co-operation, syndicalism, and guild socialism.

Foreign Countries.—The consumers' movements outside England owe their origin directly to the British movement, and all of them were many years behind it in development. But the history of their progress has been almost precisely similar to that of the British movement. In 1921 there was hardly a single European country without consumers' societies. Nearly all of these foreign movements showed a considerable increase in membership and trade during 1910-20; the war, both in belligerent and neutral countries, had a marked effect in increasing the number of co-operatives and in extending the development and co-operation. The following figures show the growth of some of the Continental movements after 1914:

Lastly, it should be remarked that in 1910-20 consumers' co-operation established itself in many countries outside Europe. For instance, up to very recent times consumers' co-operation could hardly have been said to have had any share in the progress of the American Union, partly owing to the educational work of the Co-operative League of America, a vigorous movement and some 2,000 societies had come into existence. This co-operation had also made little or no progress in Armenia, some of the British dominions, e.g. Canada, South Africa, and India.

**Industrial Producers' Co-operation.**—The typical example of producers' co-operation is the workers' society in which the workers own and manage the factory and divide the profits of the enterprise among themselves. But many distinct types of industrial organization are ordinarily included under the term producers' or workers' co-operation, types differing as widely from one another as the ordinary business or joint stock company which gives its employment a share in the profit, and the producers' workshops. Here we shall deal only with producers' co-operation in the strict sense, i.e. societies or enterprises in which the instruments of production are owned and controlled by the workers or producers.

There was little change in the position of producers' co-operation during 1910-20. There was no marked extension in the number of enterprises or in the sphere of their operations either in Great Britain or abroad. Thus the number of productive societies in the Cooperative Union actually declined from 108 in 1913 to 95 in 1916, while the number of members rose from 34,662 to 39,331. It is true the trade rose during this period from £3,710,234 to £7,047,147, but the rise in prices would more than account for this increase. The history of the workers' society from 1907 to 1921 is, in fact, a repetition of its previous history. This form of industrial organization is liable to peculiar difficulties. A small self-governing workshop is easily started and a small workers' co-operative society easily formed. But the problem of internal organization and discipline is extremely difficult, if full democratic control is exercised by the workers. Hence in Britain, France and Italy workers' societies are continually coming into existence, but, with a few exceptions, their governing workshops. As the larger and more highly organized the enterprise the more acute become the difficulties of organization, control, and discipline, the workers' society, where successful, has practically always remained a small and simple industrial unit. These facts account for the lack of development in producers' co-operation and its failure hitherto to adapt itself to the large-scale, complex organization of modern industry.

It should be noticed, however, that both syndicalism and guild socialism advocate forms of industrial organization among the producers. The development of producers' co-operation. The workers' society takes the workshop or the factory as the unit of industrial organization and places the control of industry in the hands of the workers and their representatives. If the syndicalist or guild socialist would make each industry, e.g. mining, railway transport or building, the unit of organization and would give control to the workers organized in these larger units. But, although experiments in guild socialism have already been made in England in the building trade, and although the Walkeunges Act in Germany and legislation in Italy, following the seizure of factories by the workers in 1920, made some approach to a syndicalist control by workers. Both syndicalism and guild socialism still continued 1921 in the theoretical stage. They had, however, as theories and ideals of industrial organization, taken the place which previously workers' cooperation, in the strict sense, occupied with many people.

**Cooperative Credit and Banking.**—If the consumers' co-operative movements of the world owe their origin to the British movement, Germany can claim to be the pioneer of cooperative credit and banking. Two well-known types of credit societies are distinguished in Germany, the Schulze-Delitzsch and the Raiffeisen. Apart from their differences in constitution and structure, these two types are characteristic of a difference in function which runs through the whole of cooperative credit in every country. The Schulze-Delitzsch bank supplies credit or loans to the small industrialists in towns; the Raiffeisen bank supplies credit to farmers and agriculturists. This distinction of function is fundamental, and therefore it is not surprising that the history of the spread and development of urban and rural cooperative credit has not followed the same course.

The same tendency is at work in France, where since 1914 has been seen the establishment of large districts which absorbed the small local societies.

Another feature of foreign co-operation, which should be noted, is the development of wholesale societies. The development of a consumers' movement into a large industrial system depends upon the growth of a strong wholesale society which shall eventually be capable of providing the cooperatives with great quantities of goods at reasonable prices. This has been particularly significant that in 1919 no less than 19 European movements had wholesale societies. It is true that many of them were still in the stage of wholesale dealing for the supply of the local distributive societies with the profits of the British movement shows that this stage must precede any large development in manufacturing enterprise, and many foreign wholesale societies, e.g. the French, German, and Swiss, have greatly extended their productive activities.
It is obvious that neither large scale capitalist industry nor consumers, coöperation is favourable for the development of an urban bank. People whom Schulze-Delitzsch desired to help were townsfolk, especially the small craftsmen working on their own account, the journeymen, shoemakers and so forth; and his ideal was to do this through the agency of a cooperative bank working on the model of an urban bank is always found to consist mainly of small craftsmen, shopkeepers, and small professional men. It follows that this kind of cooperative credit will only establish itself where it is compatible with industrial conditions. It still exists when the small shopkeeper has an instinct for cooperation. But these conditions are not fulfilled in many European countries. Hence the success of urban cooperative credit societies has been greatest in those countries where urban industrial conditions exist. It has been able to take the Schulze-Delitzsch model to the requirements of its own countrymen. In Germany, so in Italy, the statistics of recent years pointed to a very considerable slowing down in the growth of the movement. First of all, it should be noted that the tendency to prefer urban banks to more successful, to lose their original object and function, i.e., they tend to neglect the small man for the big man, though there is probably some truth in the contention that if the small man is helped by the bank itself has helped its members to change from small men to big men.

The movement for rural cooperative credit associations has not been subject to the same limitations as the urban movement. In many Continental countries the peasant or small farmer, in large numbers, and more often than not they are burdened by debt contracted with money lenders on onerous terms. In all these countries, there are credit associations for agricultural purposes. The coöperation to the small agriculturist is very great, and there has in fact been a considerable extension and development of this kind of cooperation. It has usually accompanied a development of other forms of agricultural coöperation and the question whether there is an essential difference between agricultural credit and credit for other purposes is in fact a question whether credit for agricultural purposes is that credit is that its development has been most erratic. Thus in Germany the whole of agricultural coöperation has developed from the Raiffeisen rural banks, and the credit associations remain the pivot of the whole movement. But at the other end of the scale are Denmark and Ireland. In no country in the world has agricultural coöperation been more successful than in Denmark, yet in 1921 rural credit banks still accounted for 85 per cent of the Danish agricultural movement was so singularly spontaneous, while Irish agricultural coöperation has been the result of intensive and prolonged propaganda. Yet the sincerity of the coöperation and the greater observance of the statutes in some districts the rural credit societies have performed useful functions, but, taking the country as a whole, they have declined while agricultural coöperation has made great progress; this is shown by the decline in the number of agricultural societies during the years from 1876 to 1918, while the agricultural societies and creameries rose from 435 in 1908 to 705 in 1918.

Between Germany at one end of the scale and Denmark and Sweden at the other, the different countries of Europe vary greatly in the degree and manner in which they have accepted the rural credit movement. In Italy, Hungary, Finland and France, for instance, rural cooperative credit associations or large scale rural credit organization of the movement is investigated in the four countries, marked differences of development become apparent. One of the most important of these differences is the degree in which the idea of the State aid. Thus the Finnish banks are essentially voluntary associations which rely for their working capital mainly upon the Rural Banks' Central Credit Institute, while this central institute obtains its funds mainly from its members. The French agricultural banks have a still longer history and very strong connection with Government aid, but after the beginning of the century they received loans from a central credit organization financed almost entirely from Government funds. It is interesting to note the large agricultural credit upon the State is most marked. The French rural credit societies are grouped under a district bank to which a society wanting a loan applies; the district bank forwards the application through the central organization and it is the central organization which makes the loan to the district bank. The system is therefore a great deal simpler than the State aid to agriculture and has scarcely any of the characteristics of voluntary coöperation.

Agricultural Coöperation.—Voluntary association among farmers, peasants, or agriculturists and can do two things for different ends. In additional to the rural cooperative credit societies already dealt with, the chief forms of agricultural coöperative organization may be classified as follows: (1) societies or associations for cooperative supply of the instruments and means of production; (2) societies or associations for cooperative production, e.g., creameries, dairies; (3) societies or associations for cooperative marketing; (4) societies or associations having a variety of miscellaneous coöperative objects, e.g., coöperative insurance. It should be noted, however, that there is not a rigid separation of function in the societies actually existing; a single society may and often does perform two distinct functions; it may for instance, perform both the function of production and that of marketing.

There was a great and widespread development of agricultural coöperation in Europe, and indeed throughout the world, during 1905-20. Unlike consumers' coöperation, however, there was very little uniformity in the development of agricultural coöperation in the various nations. As was pointed out above, in one country the whole of agricultural coöperation will centre in the organization of agricultural coöperative credit, while in another country, like Denmark, a no less highly developed system of agricultural coöperation will exist with little or no organization of Objectives. Of the so-called "great countries" only Britain is not committed to agricultural banking; it will be found that in one country agricultural coöperation has developed principally along the lines of cooperative supply, in another of cooperative production, and in another of cooperative marketing. It is not possible, therefore, to give a general account of the progress of agricultural coöperation which would be applicable to every country in which it has proved successful; all that is possible is to show the range of its development and to give one or two typical examples.

In 1907 a fully developed agricultural coöperative system existed already in Germany, Switzerland, Denmark, France, and Belgium, and a real beginning had been made in Ireland. Up to the outbreak of the World War the old established systems continued to maintain themselves, but such statistics as are available seem to indicate that agricultural coöperation was more adversely affected by the war than the consumers' movements. But the most notable feature of the decade 1910-20 was the spread of agricultural coöperation and its progress in countries where before it was non-existent or was only established. The best established examples are to be found in the United Kingdom, Norway, Sweden, Finland, and Siberia.

Agricultural coöperation in the United Kingdom nowhere developed spontaneously. Its greatest successes have been obtained in Ireland, where the whole movement was created by the Irish Agricultural Organization Society, founded in 1894. Thanks to the educational work of this association and the development of a great system of societies for supply, production, and marketing were formed on the model of Danish societies. The most successful societies were supply societies, dairies or creameries, and egg and poultry societies. By 1918 there were 292 creameries and 176 supply societies. In the next decade there was continuous progress, and by 1920 there were 354 creameries and 371 supply societies. The membership of the creameries rose from 42,404 in 1908 to 50,082 in 1917, and the turnover from £1,700,000 in 1908 to £5,300,000 in 1917, while the membership and turnover of the supply societies rose from 12,999 and 87,000 in 1908 to 31,200 and £69,000 in 1917. These figures are still lower than the great rise observed in the creameries. It contains two main features. The creameries are productive societies mainly occupied in the cooperative manufacture of dairy products, principally butter and cheese. In the early years of their existence the creameries, having no central organization, were often overstocked with butter, but the butter adversely affected the butter trade, and from 1914 to 1918 there was a big fall in the quantity of butter and a big rise in the quantity of cheese manufactured. The creameries and supply societies are closely connected with the large coöperative or retail stores, and the creameries, also perform the function of coöperative marketing for their members. In recent years the development of the productive societies has been considerable, the creameries rose from 4,000 in 1919 conditions in Ireland led to great destruction of property and heavy losses for the creameries. The second feature of Irish coöperation is the rapid development in recent years of the "Agricultural Coöperative Societies Joint Stock Companies." The creameries have been established with every kind of requirement at wholesale prices. They have had
a marked effect upon Irish agriculture, for the supply of such things as fertilizers and feeding stuffs at reasonable prices has created demand for them. The supply associations also perform an important function in providing agricultural machinery which the individual farmer could not possibly afford.

The example and success of the Irish Agricultural Organization Society led to the creation of similar movements and kindred societies in England and Scotland. In 1918 there were in England 237 supply societies with a membership of nearly 40,000 and a turnover of £4,670,000, and 39 dairies with a membership of over 5,000 and a turnover of nearly £1,300,000. In 1918 the total number of all societies was 470 and the membership over 25,000.

In Sweden, Norway, and Finland the development of agricultural cooperation has been very rapid. In Sweden organized cooperation dates from 1906 when the National Union of Swedish Agriculturists was formed. The union acts both as a supply and a marketing organization. By 1910 the union had 42,000 members and a turnover of over £1,000,000, while there were 19 provincial and 940 local cooperatives for each county; there were also 477 cooperative dairies. The development in Norway has been great and even greater, and in 1913 there were 660 cooperative dairies and 1,344 local supply societies. Norwegian agricultural cooperation is remarkable for the highly organized system of federation among both productive and supply societies. Norway and Sweden resemble Denmark in the fact that agricultural cooperation has developed and succeeded with little or no reliance upon cooperative credit. Finnish agricultural cooperation is remarkable for the way in which the various forms of cooperation, credit, supply, production, and marketing have developed. This can be seen from the increase in the turnover of the various types of societies from 1903-13:

The success of agricultural cooperation in Siberia has also been extraordinarily rapid. Cooperative butter-making associations were first started about 1900, and in 1908 the Union of Siberian Creamery Associations was established with 12 affiliated societies for the purpose of both marketing and supply. By 1914 the union had over 1,000 affiliated societies and a turnover of about £1,000,000.

**COPPER (see p.102).**—The industrial history of copper after 1910 was more important, both technically and economically, than for many decades previously. A very large part of the world's supply of the metal came after that date from deposits so low in grade that they could not be worked under the conditions of 1905. The major developments in this progress were the enlargement of the scale of operations in individual units of stupendous capacity; immense reductions in the cost of mining by the introduction of the caving system and steam shovelling; reduction in the cost of milling and increase in the extraction of mineral by the direct flotation process; the control of smelting by the application of coal-clay firing to reverberatory furnaces and the successful operation of basic-lined converters, and finally the development of processes for the hydrometallurgical treatment of certain ores and the direct production of refined electrolytic copper.

These developments were to a large extent both the inspiration toward the exploitation of the "porphyry" deposits, and the consequences thereof. The porphyry deposits are more correctly described as fine disseminations of copper minerals through large masses of igneous rock. The economic characteristics of the deposits were of a size and the phenomena of their occurrence at or near the surface in substantially horizontal positions. Fine disseminations of copper had been exploited for many years in the Lake Superior region, but there the copper occurred in its native form and the mineralization was in lodes dipping steeply. Previous to 1905 the occurrence of immense masses of rock, containing about 2% of copper in sulphide form, was known in Bingham Canyon, Utah, at Ely, Nev., and elsewhere, but it was not believed to be possible to exploit them profitably. The conception of profitable exploitation by taking advantage of improved methods in mining and the prosecution of investigations on a larger scale than hitherto, especially to Daniel C. Jackling (b. 1869) of San Francisco. The vision of plant and equipment for carrying out that conception called for immense ventures of capital ($10,000,000, for single enterprises), and this at a time when success was problematical. Production by this new group of mines began about 1907, but it was not until about 1910 that it assumed large proportions and the success of the new enterprises began to be clearly recognized. The idea at that time was to work sulphide ores containing about 2% of copper, but in the short space of the 10 years following it became possible to work ores containing little more than 1% of copper. The average grade of the porphyry copper mines and their ability to produce the metal at a very low figure stimulated the operators of lode mines, most notably the Anaconda Copper Mining Co., at Butte, Mont., toward improvements in methods in order to permit them to meet the competition of the porphyries.

**Mining Processes.**—The following are the major advances made during 1910-20 in the arts of mining and metallurgy:

1. **Steam Shovelling.**—No detailed description is necessary, for the steamed shovel and grader are substantially the same as are used in any excavation work. In their application to the working of copper-bearing ore, the latter is broken down in benches, a line of holes being charged-drilled back the face, charged heavily with an explosive, and the ore blasted down in quantities of many thousands of tons. The steam shovel is moved along a track at the bottom of the bench and picks up the broken ore, transferring it to cars alongside. Excessively large bulldozer are broken up by block-holing and blasting, but the steam shovel can pick up very large pieces, its dipper being as much as 8 cub. yd. in capacity. The largest steam shovels weigh 325 tons and dig 300 cub. yd. (place measure) per hour. The method is economical, requiring one man per ton of ore that it can be applied economically even when it is necessary to work ore ships 100 or 200 ft. of worthless overburden in order to uncover 100 vertical ft. of ore. The process of removing the overburden, tech-

2. **Grading:**—The laying out of plans for the working of a mine in this way and the figuring of the various factors furnish complicated engineering problems.

3. **When the overburden is too thick, or is too thick with relation to the thickness of the ore deposit, mining by the caving system is adopted. In essence this system consists in opening underground galleries under the ore body.** The raises to the ore body are then made, and sub-galleries of relatively small size are driven into it, with the purpose of so undercutting the ore body that its support by rock pillars is reduced to a minimum. Finally the pillars are blasted out, causing the superincumbent ore to settle in a great crushed mass. The crushed ore is then drawn off through chutes, previously prepared, into cars in the main galleries. This operation proceeds through the ore body section by section, the natural surface on the newly exposed section being protected against further settlement of the ore. It is so arranged that the coke of the ore is not damaged, but the ore body is gradually reduced in height. In mining operations the ore deposits are substantially as described. Modifications of the caving system of mining are also applicable in many more of mining, when the lode ore body is so small that a system of mining owing to its reduced requirements for labour, explosives, timber, etc.

**Reduction Processes.**—Copper ore as mined at the present time contains generally only a small percentage of copper mineral, which is obtained by crushing the ore to such fineness as to liberate the mineral particles and by separating these from the worthless gangue by the usual processes of screening and washing. The advantage is taken of the difference in specific gravities. Although there had been great improvements in the processes of ore dressing, the extent of valuable minerals continued relatively high up to 10 years ago. In the flotation of copper ores, advantage was taken of the discovery that when ore suspended in water was mixed with a small
COPPER
quantity of certain oils or other agents (the addition of oil being
perhaps only 2 Ib. per ton of ore), and was then subjected to violent
agitation, the copper minerals (if sulphides) would rise to the
surface in the form of a froth, while the worthless gangue would
settle to the bottom. Separation in this way was possible at relatively low cost and yielded a far higher percentage of the mineral
than the older processes. The improvement might be generalized by indicating an extraction of 90 %, compared with 65 to 75

%

previously.
Metallurgy.

Previous to 1910 the blast furnace and the reverberatpry furnace were frequently competitive choices for the
smelting of copper ore. At one time one would be in the lead and
then improvements would cause preference to be given to the other.
With the increasing fineness of the ore to be smelted, the leaning
began to be definitely in favour of the reverberatory furnace, but
with the advent of the Dwight-Lloyd sinterer, which enables fine
ores to be agglomerated cheaply and efficiently, the blast furnace
gained a new prestige. With the successful application of coaldust firing, however, which was due especially to the work of David
H. Browne at Copper Cliff, Ont., the reverberatory furnace obtained an unquestionable predominance, which it is likely to hold. The
modern copper-smelting plant designed for the treatment of fine
ore comprises roasting furnaces of the MacDugall type and reverberatory smelting furnaces of very large size. Pr rvious to the introduction of coal-dust firing, a furnace at Anaconda, Mont., igx 1 12
ft., smelted 240 tons of charge with one ton of coal per 4i tons of
charge. By the new method a furnace 25 x 144 ft. smelted 650 tons,
and one ton of coal smelted seven tons of charge. For the smelting
of coarse ore, and especially of heavy sulphide, the blast furnace
operated on the pyritic or the semi-pyritic principle still held its
place in 1920. These furnaces also were constructed of very large
size.
The Anaconda Co. attained dimensions of 72 x 1,044 in. at
the tuyeres, but this was exceptional, the blast furnaces at most
American works being something like 72 x 280 inches.
The converting of copper matte in a basic-lined vessel, which had
long been a hope of copper metallurgists, was carried to success by
W. H. Pierce and E. A. Cappelen-Smith at the works of the Baltimore Copper Smelting and Rolling Co., just previous to 1910, and
early in 1910 the process was introduced in the works of the Garfield
Smelting Co. in Utah. Subsequently it was found that the process
was not limited to the Pierce-Smith horizontal converters, but could
be applied to other forms of converters, both horizontal and upright.
The main advantages of the basic over the acid converter are the
decreased cost of lining (one basic lining for 2,500 tons of copper
compared with one'acid lining for 10 tons), greater air efficiency,
ability to convert low-grade matte with a mixture of silicious ore,
reduction of intermediate products, neatness and cleanliness of
plant, and decrease in danger from accidents. The basic converters
are lined with magnesite. Their use became general. They reduced
the cost of converting copper matte to less than 50
of what it used
to be with the converters lined with acid (silicious) material.
The existence of immense ore deposits of the porphyry type, but
with the copper occurring as oxide or chloride, which rendered the
ore unamenable to mechanical concentration, directed renewed
attention to the hydrometallurgical extraction of the copper of such
ore. At Chuquicamata, Chile, lies the world's greatest known deposit of copper, its development being estimated at about 700,000,000
tons assaying about 2
copper. Exploitation of this was undertaken by the Chile Copper Co., an American corporation. The copper occurs in the ore as brochantite contaminated with chlorides.
E. A. Cappelen-Smith devised a process for the leaching of this ore
with sulphuric acid, purification of the solution and deposition of the
copper by electrolysis, using magnetite anodes, but in practice
anodes of ferro-silicon have been substituted. The copper cathodes
are melted and cast into bars of grade equivalent to standard

electrolytically refined copper.
rate of 100,000,000 Ib. per annum. At Ajo, Ariz., the New Cornelia
Copper Co. also produced electrolytic copper directly from ore, from
which the copper was first leached by sulphuric acid. Hydrometallurgical extraction of copper was also applied on a large scale for the
treatment of tailings, e.g.. by the Anaconda Copper Mining Co., and
Hecla Mining Co., the latter extracting the naby the Calumet
tive copper by means of ammonia, and precipitating the copper as
oxide by distillation, with recovery of the ammonia.

General Economic Conditions.
A large part of the world's
copper production was in 1920 derived from immense units.
Thus in 1918 Anaconda produced 273,000,000 Ib. of copper. This,
however, was derived from a group of mines. The Utah Copper Co. produced 12,500,000 tons of ore in 1917, yielding 196,000,000 Ib. of copper from a single mine. Previous to the World
War about 15 cents per Ib. was regarded as a market price reasonably to be expected on the average. The cost of production
to the largest producers was about 10 cents per Ib. The immense

demand for copper for military purposes that began in 1915
temporarily outran the ability of the producers to meet it, and
the price ran up to about 32 cents per Ib. at the end of 1916 but the
increased production began to show its effect in 1917 and the
market declined materially during that year. In the latter part
of 19 1 7 the American Government fixed the price at 235 cents. Mining, smelting and refining capacities were rapidly increased and
in 1917 American electrolytic refiners attained a capacity for the
production of 2,800,000,000 Ib. of copper per annum. With the
termination of the war it was found that all of the Allied and
Associated Powers had overbought their requirements, and producers were unable to curtail their scale of operations quickly.
This led to the greatest accumulation of unsold copper in the
history of the metal, and combined with the greatly increased
cost of operation, a bad economic situation developed in the industry which continued into 1921. At the end of 1920 the price
for copper was about 125 cents per Ib. Statistics of the world's
production of copper are given in the accompanying table.
Previous to the World War the world's production of copper
had risen to an annual rate of about 1,000,000 metric tons. In
;

1916-8 there was an annual production of about 1,400,000
In 1919 it was curtailed to slightly less than the pre-war
rate.
In April 1921 a general closing of copper mines became
necessary on account of the economic situation, and the world's
production was thus curtailed to about one-third of the pre-war
rate.
American interests control (1921) the major part of the
tons.

copper production of Chile and Peru, and in fact control upward of 80% of the world's production. Outside of this control
the production of Japan, Spain, Portugal, Australia and Africa
is the most important, but of those countries Japan is the only
one whose output has exceeded 100,000 tons per annum.
The best record of progress in the mining and metallurgy of copper, economic conditions, etc., is to be found in the file of the Engineering and Mining Journal, New York.

treaties are H. O. Hofman, Metallurgy of Copper (1914); J. R. Finlay, Cost of Mining (1920); Robert Marsh, Jr., Steam Shovel Mining (1920); Herbert A. McGraw, The Flotation Process (1918); E. D. Peters, Practice of Copper Smelting (1911); and D. M. Levy, Modern Copper Smelting (1912).

CORDONNIER, VICTOR LOUIS ÉMILIE (1858- ), French general, was born at Surgy (Nièvre) March 23, 1858, and after passing through the military college of St. Cyr entered the infantry as sub-lieutenant in 1870. Eight years later he graduated from the École de Guerre, and thereafter staff and regimental service (including tours of duty in the Alps and in Algeria) alternated till in 1905 he was appointed an instructor at the École de Guerre. He had already served as commander of the cadet battalion of the school and of the 87th infantry regiment before the war. He was promoted colonel in 1910, but his work was wholly instructional. In this period he wrote his work Le Japonais en Manchourie (published 1911), a study which soon took rank as the most important critical work on the Russo-Japanese War and was translated into several languages (English translation, The Japanese in Manchuria, Part I. 1912, Part II. 1914). In 1910 on promotion to colonel he took command of an infantry regiment and in 1913 he was promoted general of brigade and appointed to command the new 57th Brigade, forming part of the reinforced corps of the Three Years' Service Act.

In command of this brigade, Cordonnier played a distinguished part in the successful action of Mangienne on Aug. 10, 1914, and in the heavy fighting of the IV. Army in the Ardenyens. Before the battle of the Marne he had been advanced to the command of the 3rd Division, and he led this formation in that battle and in the advance to St. Menehould and the Argonne which followed. On Sept. 15 he was severely wounded, and though he resumed his command in October, he had again to be invalidated. In December, having meantime become general of division and an officer of the Legion of Honour, he commanded his division in the bitter trench-warfare fighting in the Argonne, and in Jan. 1915 he was in charge of a group of divisions in Alsace. From May 1915 he commanded the VIII. Corps in the St. Mihiel sector. In July 1916, having been meantime advanced to the grade of commander in the Legion of Honour, he was appointed to command the French contingent of the Salonika armies grouped under Sarrail, which became the "Armée française d'Orient."

In general charge of the Allied left wing in Sarrail's autumn offensive he fought the actions of Ostrovo, Florina, Armenoch and Kenall, but owing to acute differences with Sarrail, which are discussed elsewhere, he returned to France just before the battle at Monastir which his movements and combats had prepared. He was already gravely ill, and immediately on landing in France was sent into hospital, where he underwent an operation for cancer. A command on the French front had been promised to him but he was never fit to take it up, and soon after the end of the World War he was placed on the retired list. He then devoted himself to historical and critical work on the war. In 1921 he published an account of the operations of the 87th Brigade under the title Une Brigade au feu; Polnis de Guerre.
